Über dieses Buch

Dies ist ein digitales Exemplar eines Buches, das seit Generationen in den Regalen der Bibliotheken aufbewahrt wurde, bevor es von Google im Rahmen eines Projekts, mit dem die Bücher dieser Welt online verfügbar gemacht werden sollen, sorgfältig gescannt wurde.

Das Buch hat das Urheberrecht überdauert und kann nun öffentlich zugänglich gemacht werden. Ein öffentlich zugängliches Buch ist ein Buch, das niemals Urheberrechten unterlag oder bei dem die Schutzfrist des Urheberrechts abgelaufen ist. Ob ein Buch öffentlich zugänglich ist, kann von Land zu Land unterschiedlich sein. Öffentlich zugängliche Bücher sind unser Tor zur Vergangenheit und stellen ein geschichtliches, kulturelles und wissenschaftliches Vermögen dar, das häufig nur schwierig zu entdecken ist.

Gebrauchsspuren, Anmerkungen und andere Randbemerkungen, die im Originalband enthalten sind, finden sich auch in dieser Datei – eine Erinnerung an die lange Reise, die das Buch vom Verleger zu einer Bibliothek und weiter zu Ihnen hinter sich gebracht hat.

Nutzungsrichtlinien

Google ist stolz, mit Bibliotheken in partnerschaftlicher Zusammenarbeit öffentlich zugängliches Material zu digitalisieren und einer breiten Masse zugänglich zu machen. Öffentlich zugängliche Bücher gehören der Öffentlichkeit, und wir sind nur ihre Hüter. Nichtsdestotrotz ist diese Arbeit kostspielig. Um diese Ressource weiterhin zur Verfügung stellen zu können, haben wir Schritte unternommen, um den Missbrauch durch kommerzielle Parteien zu verhindern. Dazu gehören technische Einschränkungen für automatisierte Abfragen.

Wir bitten Sie um Einhaltung folgender Richtlinien:

+ *Nutzung der Dateien zu nichtkommerziellen Zwecken* Wir haben Google Buchsuche für Endanwender konzipiert und möchten, dass Sie diese Dateien nur für persönliche, nichtkommerzielle Zwecke verwenden.

+ *Keine automatisierten Abfragen* Senden Sie keine automatisierten Abfragen irgendwelcher Art an das Google-System. Wenn Sie Recherchen über maschinelle Übersetzung, optische Zeichenerkennung oder andere Bereiche durchführen, in denen der Zugang zu Text in großen Mengen nützlich ist, wenden Sie sich bitte an uns. Wir fördern die Nutzung des öffentlich zugänglichen Materials für diese Zwecke und können Ihnen unter Umständen helfen.

+ *Beibehaltung von Google-Markenelementen* Das "Wasserzeichen" von Google, das Sie in jeder Datei finden, ist wichtig zur Information über dieses Projekt und hilft den Anwendern weiteres Material über Google Buchsuche zu finden. Bitte entfernen Sie das Wasserzeichen nicht.

+ *Bewegen Sie sich innerhalb der Legalität* Unabhängig von Ihrem Verwendungszweck müssen Sie sich Ihrer Verantwortung bewusst sein, sicherzustellen, dass Ihre Nutzung legal ist. Gehen Sie nicht davon aus, dass ein Buch, das nach unserem Dafürhalten für Nutzer in den USA öffentlich zugänglich ist, auch für Nutzer in anderen Ländern öffentlich zugänglich ist. Ob ein Buch noch dem Urheberrecht unterliegt, ist von Land zu Land verschieden. Wir können keine Beratung leisten, ob eine bestimmte Nutzung eines bestimmten Buches gesetzlich zulässig ist. Gehen Sie nicht davon aus, dass das Erscheinen eines Buchs in Google Buchsuche bedeutet, dass es in jeder Form und überall auf der Welt verwendet werden kann. Eine Urheberrechtsverletzung kann schwerwiegende Folgen haben.

Über Google Buchsuche

Das Ziel von Google besteht darin, die weltweiten Informationen zu organisieren und allgemein nutzbar und zugänglich zu machen. Google Buchsuche hilft Lesern dabei, die Bücher dieser Welt zu entdecken, und unterstützt Autoren und Verleger dabei, neue Zielgruppen zu erreichen. Den gesamten Buchtext können Sie im Internet unter `http://books.google.com` durchsuchen.

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

Real Transportation Train Operation

"Boss," said Joe to the Vice President, "our 'Transportation Engineer' has completed his study of congested traffic on the Main Street Line and recommends light-weight, double-truck cars, arranged for two- and three-car train operation with Westinghouse No. 514, 40 hp. motors and light weight HL control. He also recommends the retirement of all the heavy cars on the other lines, and the purchase of fifty safety cars with Westinghouse No. 508 motors."

"That is just the kind of information and advise I expected we would get if we put on a capable engineer to study our transportation problems," commented the Vice President. "Efficient transportation is a very complex art today, and must be studied and analyzed by a trained specialist. Public convenience, comfort and safety must be considered first, then economy, effectively fitting into these requirements the most efficient and reliable cars, equipment, power distribution, and track facilities. The work of our 'Transportation Engineer' is going to be a big factor in assisting us to establish cordial public relations. We will always have facts to prove our position."

Instructions for Use of Index

This index is essentially a subject index, not an index of titles, and articles treating a number of different subjects are indexed under each of them. In addition, a geographical reference is published wherever the article relates to any particular railway company, or to the state matters of any particular state. The geographical method of grouping serves to locate in the index any article descriptive of practices, conditions, events, etc., when the searcher knows the electric railway, city or state to which the article applies. Groupings are made under the name of the city in which the main office of the company is located, but an exception is made in the case of electrified sections of steam railroads, such entries being made direct under the name of the railroad. City or state affairs appear under the names of the city or state involved.

In the subject index, the alphabetical method is followed, and if there is a choice of two or three keywords the one most generally used has been selected, cross references being supplied. Below will be found a list of the common keywords used in the index to this volume. This list has been subdivided for convenience into thirteen general subjects, but the general subject headings, shown in capital letters, do not appear in the body of the index unless, like "employees," they appear also in small type. As an example of how to use the index, if a reader wishes to locate an article on special trackwork he would obviously look in the list under the general subject Track and under this caption, only Special trackwork could apply to the article in question. The reader would therefore refer to this keyword under S in the body of the index.

In addition to the groups of articles covered by these headings the papers and reports from railway associations are grouped under the names of the various organizations. Proceedings of other associations and societies are indexed in general only in accordance with the subject discussed. Short descriptions of machine tools appear only under the heading "Repair shop equipment" and are not indexed alphabetically, because of the fact that there is a wide choice in most cases of the proper keyword to be used.

CLASSIFIED LIST OF KEYWORDS

ACCIDENTS AND ACCIDENT PREVENTION

Accident claim department
Accidents (including wrecks)
Safety work
Storm and fire damage

CARS AND OTHER VEHICLES

Automobiles
Cars (including car design)
Locomotives
Motor buses
Motor cars, Gasoline
Motor trucks
Service and tower trucks
Trackless trolley
Work and wrecking cars

CAR EQUIPMENT

Bearings
Brakes and compressors
Current collection
Electrical equipment
Fixtures
Gears and pinions
Motors
Trucks
Wheels and axles

EMPLOYEES

Employees
Labor

A

Abandoning of lines:
—Connecticut Valley Street Ry., 762.
—Expected service discussed by A.A.R.U.C., 820.
—Indiana, Columbus & Eastern Traction Co., 862.
—Interurban Railway & Terminal Co., 986.
—Monmouth County Electric Co., 307.
—Point Gratiot Street Ry. lines, 615.
—Sacramento, Cal., 340.
—Sought by Springfield & Washington Ry., 761.
—Sought in Jackson, Mich., 410.
—Sought in San Diego, Cal., 959.
Accident claim department:
—Ambulance chaser, A.E.R.C.A. symposium, 674.
—Annual convention A.E.R.C.A., Proceedings, 665.
—Automobile accidents, A.E.R.C.A. symposium, 671.
—"Claim agent" a misnomer [Weh], 667.
—Effect upon claims of accident prevention: A.E.R.C.A. symposium, 669.
—Fundamentals of [Guilliams], 665.
—Medical testimony [Aston], 171, 676, [Leeming], 717.
—Safety department to supersede [Rice by Brown], 113.
—Safety work of, Comments on, 107, 657.
—Trainmen should obtain witnesses [Solon], 666.
—Trend of claims work [Handlon], 678.
Accident prevention (see Safety work)
Accidents (including wrecks);
—Automobile statistics, 709.
—Car jumps track in Albany, N. Y., 988.
—Control lost in Meriden, Conn., 100.
—Motorman's caution saves a life, 243.
—Oil-burning heating torch explodes, Comments on, 151.
—Open switch cause in Detroit, Mich., 891.
—Rear end collision on Hudson & Manhattan R.R., 343.
—Report of National Safety Council for 1920, 607.
—Smoke fumes in subway, 59, 177; Comments on, 187.
—Train dynamited, 304.
Accounting:
—A.E.R.E.A. committee report, 596.
—Apportioning costs between freight and passenger business [Hixon], *357; Discussed by C.E.R.A.A., 360.
—Budgets:
  Expenditures controlled by, *970.
—Budget system [Snow], 562.
—Bureau established by W. U. A., 984.
—Classification of acounts [A.E.R.A.A. Com.], 634.
—Modern system for public utilities [Timm], *563.
—Relation between accountant and engineer [Dreyfus], *559.
—Stores accounting system on Chicago "L" [Kretschwer], *510.
—Stores [A.E.R.A.A. Com.], 635.
Advertising (see also Merchandising transportation and Publicity).
—Car-stop posts used in Berlin, *196.
—Moving chart for stop guide, 917.
Akron, Ohio:
—Northern Ohio Traction & Light Co.:
  Armature holder for commutator turning, *325.
  Franchise referendum, 207, 244.
Akron, Ohio (continued):
  Freight service extension, 926.
  Hydraulagraph for wheel press, *225.
  Interchange agreement with steam road, 894.
  Jig for boring axle bearings, *266.
  Jig for boring brakeshoe head, *83.
  Petition for removal of Massilon lines, 276.
  Portable paint spraying, *234.
  Pressing wheels off without disturbing gears, *394.
  Viaduct eliminates hills, *809
  Viaduct found to be safe, 369.
Alabama, Tennessee & Northern R.R. (see Mobile, Ala.).
Albany, Ala.:
—North Alabama Traction Co.
  Line sold, 892.
Albany, N. Y.:
—United Traction Co.:
  Car jumps track, 988.
  Fare adjustment, 63.
  Jitneys opposed, 894.
  July-September report, 862.
  June report, 308.
  Safety campaign, 277.
Algiers, La.:
—South New Orleans Light & Traction Co.:
  Viaduct over Southern Pacific R.R. tracks, 314, 758, 828.
Altoona, Pa.:
—Altoona & Logan Valley Electric Ry.:
  Commission certificate of valuation issued, 762.
  Motorman avoids accident, 243.
  One-man cars successful, 793.
American Cities Co. (see New York City).
American Construction Council:
—Organization meeting, 52.
American Electric Railway Accountants' Assn.:
—Annual convention:
  Election of officers, 637.
  Papers and proceedings, 559, 562, 634-638.
  Presidential address, [Webster], 634.
  Program, 330, 404; Comments on, 623.
—Committee activities:
  Relations with other associations, 636.
  Standard classification of accounts, 634.
  Stores accounting, 635; Discussed by A.E.R.A.A., 635.
—Committee personnel, 54, 885.
American Electric Railway Association:
—Accident posters, *985.
—Advertising section active, 21.
—Annual convention:
  Advanced distribution of reports; Comments on, 497.
  Building, *364.
  Chicago as a meeting place; Comments on, 535.
  Conference of interurban companies on transportation act, 524.
  Distribution of proceedings, 918.
  Exhibits and entertainments, 332, 365, 606, 731; Comments on, 347.
  Meeting of publicity agents, 404.
  Officers elected, 573, *578.
  Organization of public utilities advertising assn. favored, 546.
  Papers and proceedings, 537-580, 857.
  Presidential address [Todd], 537.
  Program 330.
  Purposes, 53.
  Record breaking attendance, 643.
  Report of executive secretary, 569.
  Résumé, 741.
  Safety a prominent topic; Comments on, 418.
  Transportation of delegates, 365.
—Bureau of Information and Service:
  Bulletins published, 54, 239, 607, 643, 756, 887.
—Bus companies as members of, Comments on, 966.
—Closer relations with South America, Comments on, 315.
—Coal representative, 239.
—Committee activities:
  Committee of one hundred, 682, 953.
  Constitution and by-laws, 570.
  Convention entertainment, 54, 239.
  Co-operation of manufacturers, 572.
  Co-operation with state and sectional associations, 571.
  Dinner committee, 918.
  Education, 574, 985. Discussed by W. H. Timbie, 576.
  Electrolysis, 579.
  Execution, 53, 332, 580, 856.
  Exhibits, 21.
  Finance, 569.
  Highway construction and maintenance, 21, 579, 1018.
  Mail pay, 573.
  Membership, 21, 570.
  National relations, 573, 887.
  National utilities associations, 574.
  Nominating, 332.
  Publications, 570.
  Publicity, 571.
  Subjects and meetings committee, 607.
  Trackless transportation, 93, 576,; Discussed by A.E.R.A., 577.
  Uniform motor vehicle regulatory law, 577; Discussed by A.E.R.A., 579.
  Valuation, 571.
  Welded rail joints, 624; Comments on, 380.
—Committees deserve thanks:
  Comments on, 498.
—Committee personnel, 53, 884; Comments on, 536.
—Company section activities:
  Camden, N. J., 887.
  Connecticut Co., 302, 857, 1018.
  Need for, Comments, 254.
American Electric Railway Assn. (continued):
—"Good will" signs, 329.
—Mid-year meeting:
  California invitation, 682.
  Washington recommended, 857; Comments on, 870.
—Posters to encourage railway patronage.
—Prompt committee work, Comments on, 769.
Reorganization, Comments on, 623.
—Resolutions on C. B. Holmes, 643.
—Secretary for all affiliated societies; Comments on, 657.
—Symposium versus formal papers; Comments on, 535.
—Co-operate with other associations in safety work, 485.
—Way committee report on substitute ties; Communication on ["Engineer"], 778, [Dunham], 779.
American Electric Railway Claims Association:
—Annual convention:
  Presidential address, [Rice], 665.
  Proceedings, 665-679.
  Program, 404, 485; Comments on, 623, 657.
  Resolutions, 678.
  Officers elected, 678.
  Symposium on ambulance chaser; [Smithers], 674; [Kubu], 674; [Yenson], 675; [Powell], 675; [Hersald], 675; [Kernen], 675; [Waring], 676; [Picket], 676.
  Symposium on automobile accidents: [McRoberts], 671; [Raver], 672; [Paige], 672; [Shaw], 672; [Prugh], 673; [Waltz], 673; [Conklin], 673.
  Symposium on "Effect upon claims of accident prevention"; [Hoskins], 669; [Funk], 670; [Edwards], 670; [Oldenburg], 670; [Robinson], 670.
—Committee personnel, 885.
—Objects to be expanded, 329.
—Prevention work; Comments on, 657.
—Reports on work done [Rice], 663.
—Safety epigrams [Rice], *354.
American Electric Railway Engineering Assn.:
—Annual convention:
  Papers and proceedings, 593-606.
  Presidential address [Kimball], 593.
  Résumé, 744.
  Secretary's report, Abstract of, *593.
  Tentative programs, 330.
—Committee activities:
  Buildings and structures, 598; Discussed by A.E.R.E.A., 598.
  Engineering accounting, 596.
  Equipment, *598.
  Executive, 53, 205, 239, 271.
  Heavy electric traction, 595; Comments on, 535; Discussed by A.E.R.E.A., 596.
  Nominating, 606.
  Power distribution, 603, 953, 985; Discussed by A.E.R.E.A., 604.
  Power generation, 602; Discussed by A.E.R.E.A., 604.
  Purchases and stores, 605.
  Reorganization of engineering association, 594.
  Resolutions, 606.
  Standards, 486, 606.
  Subjects, 173.
  Unification of car design, *594; Discussed by A.E.R.E.A., 595.
  Way matters, 600; Discussed by A.E.R.E.A., 602; Comments on, 537; Communications on [Cram], c709; ["Engineer"], c778; [Dunham], c779.

Volume 60 New York, Saturday, July 1, 1922 *Number* 1

Mr. Attwill's Objection to Some Forms of Regulation Appears Reasonable

THE high-water mark of the 1922 Bluff Point meeting of the New York Association was reached while Hon. Henry C. Attwill, chairman of the Massachusetts Department of Public Utilities, was explaining to the banqueters in the evening what he thinks of the interrelation between the utilities and the public. He believes that there should be as little interference as possible by a public service commission in the operation of a utility even in the matter of fares. The duty of the commission is simply to see that the utility management is doing a good job. Moreover, Mr. Attwill practices what he preaches and is highly gratified when the Boston Elevated, the Bay State, the Worcester Consolidated, or any other system in the State succeeds in furnishing good service in its community at a reasonable profit to the stockholders.

In his address, which is abstracted elsewhere in connection with the report of the meeting, the speaker stigmatized as "meddlesome interference" the unnecessary dabbling by commissions in utility management. These are strong and suggestive words. They were picked by the commissioner from the mass of English words at his disposal with a view to expressing exactly what he meant. While his remarks were addressed to electric railway men, he knew perfectly well that they would reach other commissioners in due course. It might be well for electric railway men to insure this. For this purpose Mr. Attwill's philosophy of commission regulation might be summarized as follows:

Make sure that the utility management is capable and honest, and bent upon carrying out the spirit of its contract with the public; this assured, encourage the management in its efforts, insuring an appreciation on the part of the public of what is being done in its best interest; with these two points covered properly, avoid meddlesome interference with the operation of the property.

All Work and No Play, Etc., But——

THE general good fellowship which pervades the gatherings of electric railway organizations, particularly those in which the feminine element is a factor, is highly commendable. This very element, however, if overemphasized, may cause the loss of some excellent opportunities for discussion of pressing problems. While the electric railways are in better condition than they were, say a year ago, they are far from being on "Easy Street," and it is safe to say that they need every scrap of information they can get to put them firmly on their feet.

These remarks are prompted by the fortieth annual meeting of the New York Electric Railway Association, held at Bluff Point, Lake Champlain, this week. The meeting was one of the most delightful that the association has held in its long and creditable history. It came at the end of a strenuous year's work, mostly done by committees. It furnished the recreational element lacking in the more serious quarterly meetings, held during the year in New York City. The features of the business session were carried out as advertised, but the technical papers were read by title only or postponed, and there was no discussion. This was a disappointment to a minority of those present, but an overwhelming majority favored the procedure. Fortunately, two of the advertised papers had been prepared in advance so that it is possible to give abstracts of them in connection with the report of the meeting, which appears elsewhere in this issue.

Data Published This Week Point to Better Times

A NUMBER of indications that the electric railway industry is in much better condition than for a number of years back have been cited in these columns. Perhaps the most striking proof yet offered to prove this contention is given in the table published in the department of Manufactures and Markets in this week's issue of this paper, giving the number of cars ordered by electric railway companies since the year began. As explained in the text accompanying this table, it has not been compiled in exactly the same way as that used in the statistical table published in the issue of Jan. 7. For that table the information was obtained directly from the railway companies themselves, whereas the data in the table on page 31 are simply of the cars built by the leading car builders. For this reason, this week's table does not include cars built in railway shops or those ordered from the smaller local car builders. Nevertheless, the total for the last six months is considerably in excess of the number given in the table covering the entire year of 1921.

A closer examination of the table shows that these car orders are pretty well scattered over the country and that they are made up of comparatively small orders. The largest order in the list is for 100 cars, and there is only one of these. There are two orders of ninety-five cars, one of seventy-five and one of fifty-two. All of the other orders are for fifty cars or less. This also indicates the feeling is general that the time has come when the financial condition of the companies, as well as the prices of cars, warrants the placing of orders. It should be noted that two or three large pending orders, such as that of the Interborough Rapid Transit Company for 100 cars and of the Detroit Municipal Railway for the same number of cars, are not included in this list because these orders have not yet been placed. These will help to swell the list of car orders during the latter half of the year.

Another significant group of figures which show the improved status of electric railways is the sixteen months figures given in the Financial and Corporate department of this issue. These figures represent the combined statistics of some eighty-one electric railway properties whose monthly earnings are corrected and compiled by the statistician of the American Electric Railway Association. While they indicate that the gross business being done by the electric railways is not increasing, as is hardly to be expected in these times, the operating ratio is decreasing. This means a larger net return. It is undoubtedly the better financial condition of the electric railways which has been established by these greater net earnings which has given the companies the additional credit which they have needed for the purchase of cars.

These and other indications prove that the industry is beginning to flourish again in spite of all the handicaps of the past and present.

It Can Be Done!

WHO says that all this talk about "selling transportation" is futile? It is being done! The pages of this and other papers have been carrying many interesting reports of late of successful publicity plans, weekly pass schemes, courtesy campaigns and other business-like merchandising methods adopted by the more progressive protagonists of selling transportation. Even the daily newspapers, ever critical and suspicious of public utility propaganda, recognize the new era.

Only the other day no less an authority than the New York *Herald* carried a half column editorial entitled "Transportation Salesmen," commenting favorably on the good work of the Eastern Massachusetts Street Railway and the Fifth Avenue Coach Company. These two originators have made a specialty of carefully training their platform employees who are in direct contact with the traveling public. These men are the logical candidates for salesmen. They are beginning to appreciate the fact that their own self-interest demands something more than just putting in their time. If any one doubts that the efforts of the Eastern Massachusetts company are bearing fruit, let the doubter take a few rides on the street cars of this Bay State road and note the more friendly attitude of the men toward passengers who ask questions, watch the accurate timing of cars on schedules and other evidences of good service.

Speaking of these things the New York *Herald*, in a recent issue, said:

> The sales idea brings home to the employee conciousness of his direct personal interest in increasing sales and in developing good will among purchasers. With every street car that competition puts out of business jobs are canceled. With every advance competition makes the hold on remaining jobs becomes more precarious. If the market, and with it the jobs, are to be held the goods delivered must be kept abreast with competition standards.

Although it may have been painful in many cases, perhaps this era of growing competition from jitneys, pleasure automobiles, and even walking, may prove to have been an evil not entirely unmixed with good. If it brings home to the railway man, whether he sits at an executive desk or collects fares on the end of a trolley car, a keener realization of his responsibility to the public for more efficient, economical, prompt and courteous service, it may yet prove to be the means of bringing the electric railway transportation industry back to its rightful place in popular esteem.

Restoration of credit with the riding public must precede restoration of credit with the investing public. The news of the day shows that "it can be done."

A Payment of $250 Increases the Interest from 4 to 6 per Cent

MONEY rates are coming down. Refunding operations are the order of the day. The 7 and 8 per cent short-term issues are being called in and replaced by long-term bonds at prevailing rates. These operations are being carried out mostly among the industrial issues, but not entirely so. The investor who placed his funds in a callable bond can get such measure of satisfaction as is possible out of his calculation of the saving to the corporation by the replacement of a 7 or 8 per cent issue with a 5½ or 6 per cent issue, but the pleasure is nearly all the corporation's, while the problem of disposing of his returned funds in the changed market is all the investor's.

It is very often a nice question to decide what shall be done in a refunding operation, but it is usually a comparatively simple one to settle. Not so, however, was the poser placed before investors by the United Railways & Electric Company of Baltimore. The proposal of that company set statisticians, bond men and investors to figuring. The railway made an offer to the holders of its first mortgage 4 per cent bonds due in 1949, wherein by the payment of $250 on each $1,000 bond the holder had the privilege of exchanging his 4 per cent bond for another bond of precisely the same issue but bearing interest at the rate of 6 per cent.

In April the company financed its maturing requirements by the issue of $6,000,000 first consolidated mortgage bonds bearing 6 per cent interest. These bonds are exactly the same as the first consolidated mortgage 4 per cent bonds except that coupons are added, representing the additional 2 per cent per annum. After the bonds bearing 6 per cent interest were sold the additional requirements of the company for the time being were small in amount; therefore, the recent tender of the company was limited to 40 per cent of the outstanding 4 per cent bonds. There are $26,450,000 of these bonds listed on the Baltimore Stock Exchange. With 40 per cent of them deposited under the plan the company would receive $2,645,000.

One of the banking houses which urged deposit of the securities said that while it was true that the company would benefit by such an arrangement it was also true that the company was receiving funds which in due process of time it would not have to repay. It was further true that these funds would cost the railway company, according to actuarial figures, about 6½ per cent over a period of twenty-seven years, and that while the investor would get 8 per cent on his additional payment, he would eventually twenty-seven years hence lose the extra sum he had been asked to pay in. The opinion of this expert was that by assenting to the plan the bondholder benefits equally with the company, and possibly gains more.

There are a number of other angles to the problem. One of them is the fact that the opportunity for enhancement in value of a 6 per cent bond was far better than that of a 4 per cent bond. This consideration would weigh particularly with the bondholder who had purchased at 75—either slightly more or slightly less. The company was ordered by the Public Service Commission to prorate the depositing bonds if more than 40 per cent were tendered for conversion. Altogether the problem presents a number of aspects which are quite different from those which have to be considered in the usual refunding operation.

A "FLY-BOAT" OR "BATEAU MOUCHE" ON THE SEINE, OPERATED BY THE UNIFIED TRANSPORTATION SYSTEM

Paris Popularizes Transportation

Under Unified System Urban and Suburban Trolley Lines and Omnibuses as Well as Seine Steamers Are Being Operated in Co-ordination to Give Best Possible Service

STREET car travel in France, taking the franc at pre-war exchange, has become very expensive of late, or about 11 cents for the average three or four-mile trip within the city walls. In terms of American money at current rates, however, it is about half of this sum, and the fare is higher once the fortifications are passed. Paris surface traffic is, however, essentially urban. An effort is being made to extend this surface traffic by feeders to the near-by countryside.

Recently the Department of the Seine purchased the systems operated by the six principal tramway companies in Paris (Compagnie générale des Omnibus de Paris, Compagnie des Tramways de Paris et du département de la Seine, Compagnie des Tramways de l'Est-Parisien, Compagnie des Chemins de fer Nogentais, Compagnie générale Parisienne de Tramways, Compagnie électrique des Tramways de la Rive gauche), as well as the omnibus system belonging to the Compagnie générale des Omnibus de Paris. This aggregation now constitutes a single system, called since Jan. 1, 1921, the Société des Transports en Commun de la Region parisienne. The same company also took over in 1921 the boat service on the Seine, which had been suspended during the war. The boats are rapidly being put back into condition. There has also been incorporated in the system, since Jan. 1, 1922, the Chemin de fer du Bois du Boulogne, purchased in 1921 by the department. There now remain outside the T. C. R. P. system only the following lines:

The Tramways de l'Ouest-Parisien, operated by a receiver, appointed by the court, the concessionaire company having abandoned its operation in 1918. The status of this system still remains to be determined.

The railway line between Paris and Arpajon, operated by an independent company. The purchase of this line, decided on in December, 1921, is subject to approval of the Conseil d'Etat.

The departmental railways de Grande-Banlieue (Seine and Seine-et-Oise), which, however, are to be turned over by the Department of the Seine-et-Oise to the Department of the Seine.

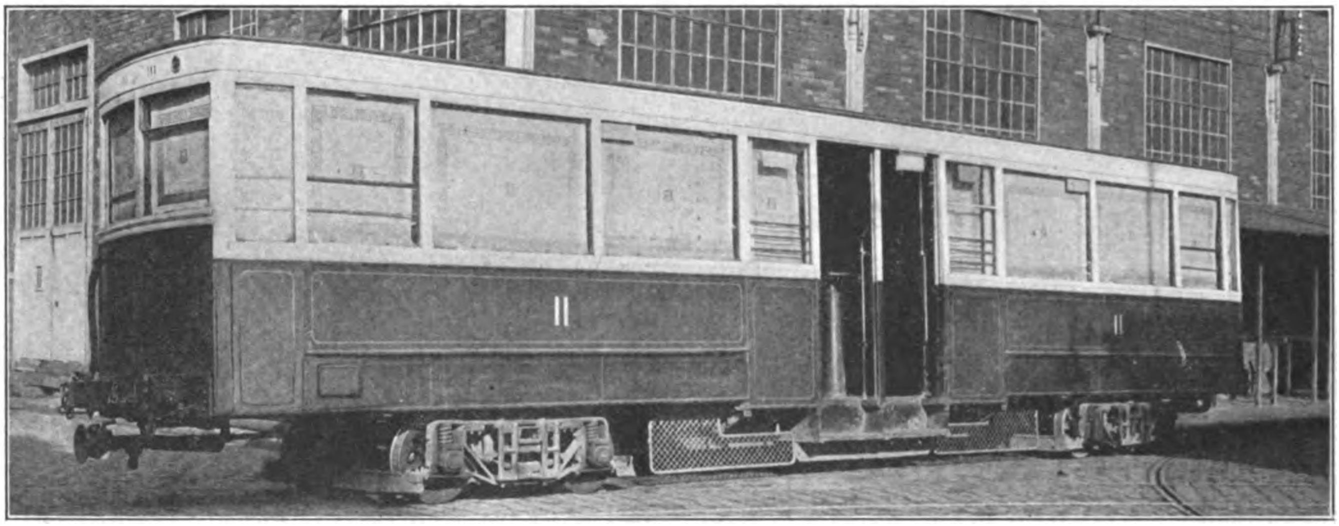
These different systems will be incorporated in the T. C. R. P. system, subject to the indispensable administrative approval.

SYSTEM IS OF GREAT MAGNITUDE

The new company is of impressive proportions, as well from the point of view of the capital involved as for the number of services operated and the number of employees. The value of the investment at pre-war figures of over 450,000,000 francs may be considered today, in view of present-day costs and values, as having been increased to 1,200,000,000 to 1,400,000,000 francs. In view also of the proposed rehabilitation and additions of material, equipment and rolling stock this will soon be still further increased. Various improvements are under way which will require the expenditure of 400,000,000 francs more, of which more than 100,000,000 francs was expended during the past year.

The combined system has five omnibus garages and twenty-five carhouses. The first cover a total ground area of 18.8 acres and the second of 73 acres, about one-half of these carhouses being of recent construction and equipment. There are thirty-five electric substations, the most important containing also the administrative offices of the company.

For the construction, repair and upkeep of cars the company has a central repair shop occupying 19 acres, with departments as follows: Wood-working and body shop, wood storage depot, general machine shop, electrical wiring shop, erecting shop, electrical appliance



TYPICAL DOUBLE-TRUCK TRAIL CAR, PARIS

shop, paint shop and mechanical and chemical laboratory. All of these installations are fitted with modern machinery.

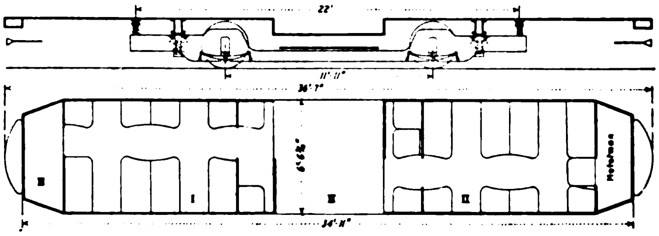
In addition there are four shops devoted to roadbed and other departments.

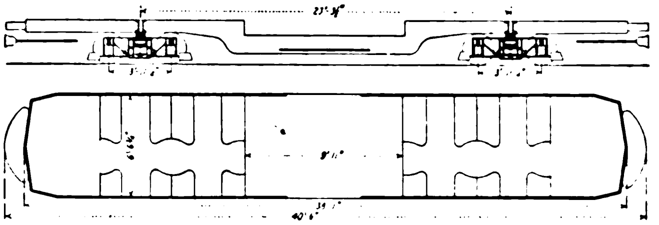
The length of track in operation is 621.4 miles. Of this mileage 93.21 miles has underground contact line and 528.2 miles has trolley contact.

The rolling stock is divided thus: Motor cars, 1,762; trailers, 832, and motor omnibuses, 1,050. Rolling stock under construction includes: Motor cars, 550; trailers, 300; motor omnibuses (four-wheel), 265; (six-wheel), 50; trackless trolley omnibuses, 6.

ELEVATION AND SEATING PLAN OF MOTOR CAR

Capacity, for first-class passengers, fourteen seats; second class, sixteen seats, nineteen standing places; total, 49. Weight, empty 32,700 lb., loaded 40,200 lb.; per passenger, 667 lb. dead weight.





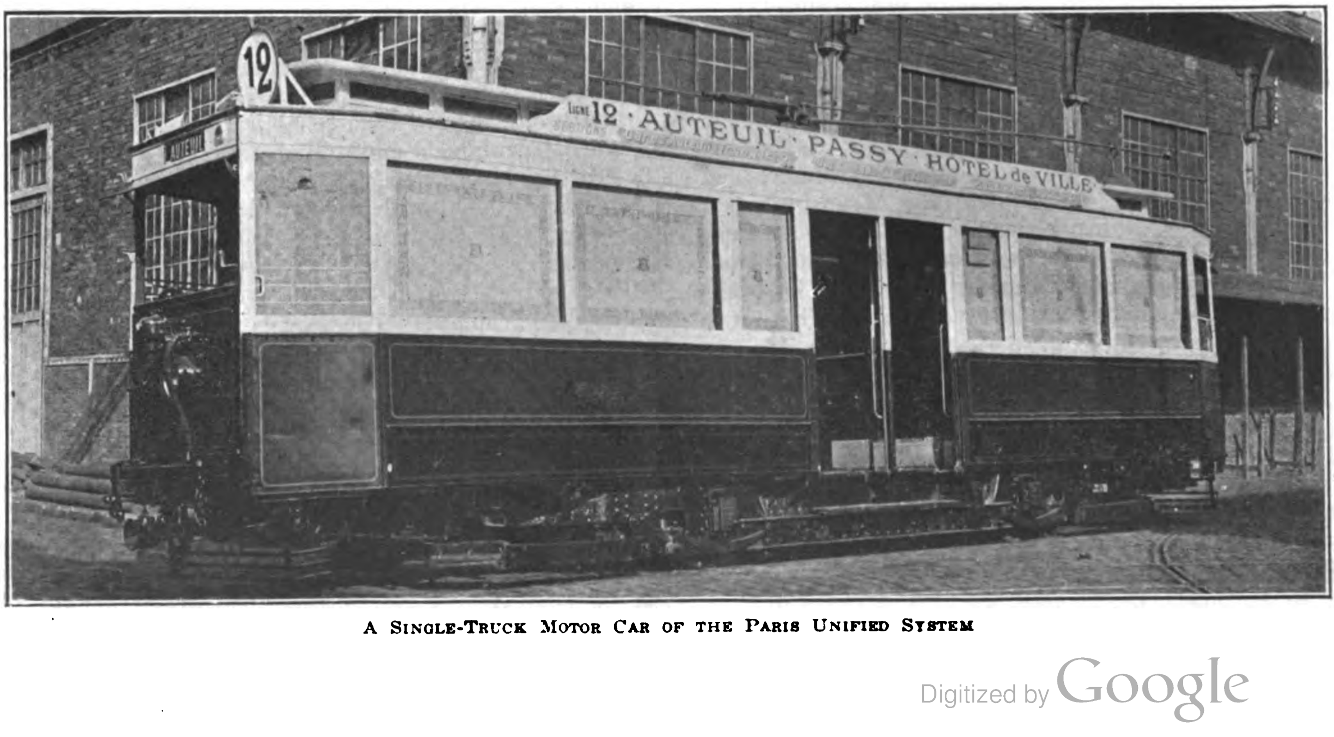
ELEVATION AND SEATING PLAN OF TRAILER

Capacity twenty-four seated and forty-five standing passengers, total sixty-nine, all second class. Weight, empty 18,500 lb., loaded 28,700 lb.; per passenger, 269 lb. dead weight.

The consumption of gasoline by automobile omnibuses per day is 15,852 gal. and the total energy consumption by electric cars is 200,000 kw.-hr. per day.

PARIS TRANSPORTATION FACILITIES INADEQUATE

Today, in spite of the half dozen lines of underground railway in the metropolitan district of Paris and the Belt Line Railway, which encircles the city along the old fortifications, omnibuses and street cars are full to overflowing. By the recent consolidation it has been possible to rearrange the lines to improve operating conditions and service at the same time. The practice was tried of charging higher fares in certain "luxury" neighborhoods, but this was not a success.



A SINGLE-TRUCK MOTOR CAR OF THE PARIS UNIFIED SYSTEM

Six of These Trolley Buses Are Used in the Suburbs of Paris

The same is true of fares of a franc or more from midnight on. The 1,050 omnibuses run on forty-two definite routes inside the city limits of Paris, and two supplementary lines are about to be put into service. The omnibuses do not now go outside the fortifications, but there are certain lines which are about to be extended into the suburbs.

Under the unified system it is possible to travel from Saint Germain and Versailles to the west of Paris, to Gourney and Montfermeil on the east, a distance of 22 miles. Another line runs from Montmorency and Pierrefitte to the north of Paris to Villejuif on the south, 17 miles or more. A change of cars in each case is necessary in the heart of Paris.

The river equipment was acquired from the old Bateaux Omnibus Company and included sixty-three boats, of which eighteen have been rehabilitated and are now in service between Maisons-Alfort above Paris and Auteil at the down-river limits. As this is written the service is about to be extended to Suresnes.

The latest figures available showing the data for a year's operation are given in the accompanying table.

DATA FOR ONE YEAR FOR PARIS UNIFIED TRANSPORTATION SYSTEM

	Vehicle-Miles (Approx.)	Total Receipts	Receipts per Mile, Cents	Passengers Carried	Receipts per Passenger, Cents	Passengers per Mile
Tramways........	53,000,000	$16,500,000	31.1	613,360,254	2.69	11.6
Omnibuses........	21,250,000	7,580,000	34.6	245,802,430	3.09	11.2
Seine boats.......	64,500	24,400	37.8	485,401	5.2	7.78

NOTE—Exchange in this table is taken at 9.2 cents per franc.

These figures worked out on a daily basis show that the motor omnibuses ran 60,000 miles per day and the tramcars 145,000 miles per day. The average number of passengers per day was 2,355,000, equivalent to practically 80 per cent of the entire Parisian population. The daily receipts were $69,000. The number of seats available is about 3,000,000 per day.

The entire services of the T. C. R. P. are under the direction of the president of a Council of Administration, M. Andre Mariage, assisted by a general secretary, a general manager of operation and a general manager of finance.

The personnel of the T. C. R. P. comprises a total of 28,000 persons, of which 6,500 are conductors and 5,500 are motormen.

Map Shows Power Stations and Transmission Lines

A NEW MAP of Virginia on a scale of 1:500,000, showing the location of the power stations and transmission lines used in public service and the names of the public utility companies, has just been published by the United States Geological Survey, Department of the Interior.

This map is one of the series of state power maps now being published by the Geological Survey. Maps have already been completed of New York, Pennsylvania, Massachusetts, Rhode Island, Connecticut, Maryland, Delaware, District of Columbia, Vermont, New Hampshire and New Jersey, and maps of Indiana, Maine and West Virginia are being prepared for publication. The maps available for distribution may be purchased from the Director of the United States Geological Survey.

These maps will be valuable to those who are interested in the interconnection of power plants, to manufacturers and many others.

Large Traffic Records at Sydney

A FEATURE of the traffic at Sydney, New South Wales, is the business which comes for two weeks during the Easter period in carrying passengers to the racecourse and to the agricultural show grounds. There are meetings at the racetrack for four of these days and a special exhibit at the agricultural grounds for nine days. During the two weeks period this year the tramway system carried 13,075,925 passengers, the largest number ever carried and an increase of 187,286 over 1921. The fare to the racecourse is 2s. 3d. (54 cents) round trip, including 1s. 1d. entrance to the course, and to the agricultural show grounds it is 6d. (12 cents) round trip. The ordinary fare on the cars passing these places is 3d. (6 cents) each way. The system has 1,200 passenger cars available for this special service and also the ordinary city service, which of course has to be maintained during this period.

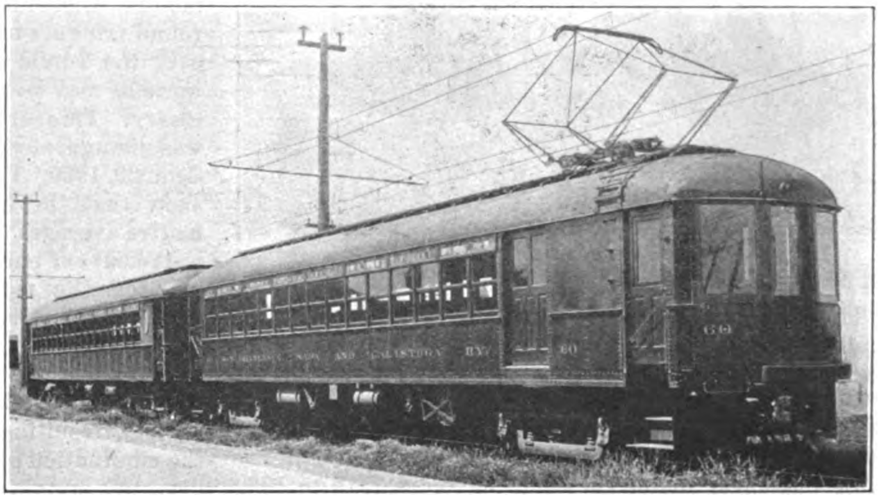
This log sheet is used by the Citizens Electric Company, which furnishes power to the Hot Springs Street Railway, and by the other power companies controlled by the Federal Light & Traction Company. All of the data called for are entered on this blank and a copy of the sheet for each day is sent to the holding company in New York. The form makes a very complete one-sheet log. The sheet measures 13½ x 18½ in.

The Napa Valley Route

The San Francisco, Napa & Calistoga Railway Is a Successful Single-Phase California Electric System—In Connection with a Boat Line It Offers Through Service to San Francisco



Typical Passenger Train of Motor and Trailer Equipped with Four 100-Hp. Motors

THE San Francisco, Napa & Calistoga Railway operates 46.52 miles of electrified standard-gage track between the cities of Vallejo and Calistoga, Cal., in the Napa Valley, which is rich in agricultural and other natural resources. The southern terminal, Vallejo, is on the northern shore of San Francisco Bay, opposite the United States Navy Yard at Mare Island, the largest naval station on the Pacific Coast. At Vallejo, the railway company, under a long-term agreement with the Monticello Steamship Company, transfers passengers for San Francisco and points south to and from twenty trains daily. This is the quickest and most convenient service available to the traveling public in this territory. This is appreciated by the patrons of the road as is evidenced by the fact that although paralleled by a new state highway the full length of the route no material effects have been noticed in a reduction in passenger traffic.

The Mare Island Navy Yard, during the war, employed 9,000 people. Although somewhat reduced in activity at the present time, special commuters' trains are operated for those residing in Napa and other points along the line. The location of the line is shown on the map. The line from Vallejo to Napa was built in 1905. It was extended to St. Helena in 1908 and completed to Calistoga in 1912. The general office, shops and power house are located at Napa.

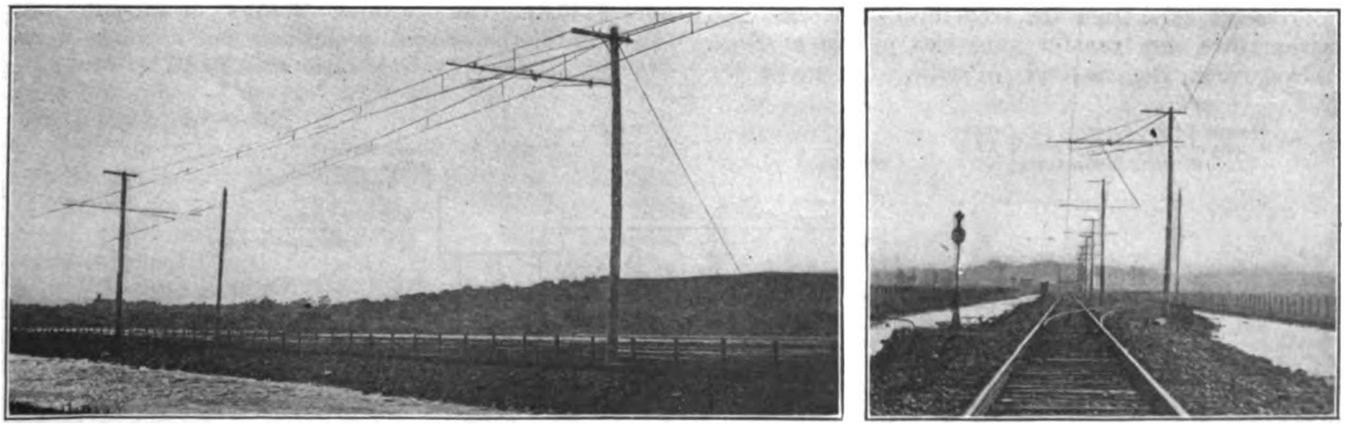
Trains consist of two to four cars, motors and trailers operated in multiple-unit trains. The power supply taken by the pantograph with steel slider from the No. 000 grooved overhead conductor is single phase, twenty-five cycle, 3,300 volts alternating current. The power is supplied at Napa by the Great Western Power Company at 2,300 volts, three phase, sixty cycles, to induction motor-generator sets and changed to single-phase, 25 cycles, 6,600 volts.

In the power station are one 800-kw. and two 400-kw. units. Transformers of 500 kva. capacity are located without attendance at Vallejo, 14½ miles distant, and at Rutherford, 15 miles distant. A similar transformer is located at Napa. Circuit breakers located at mid-points sectionalize the line so that section protection is afforded. The distribution system is shown in an accompanying illustration.

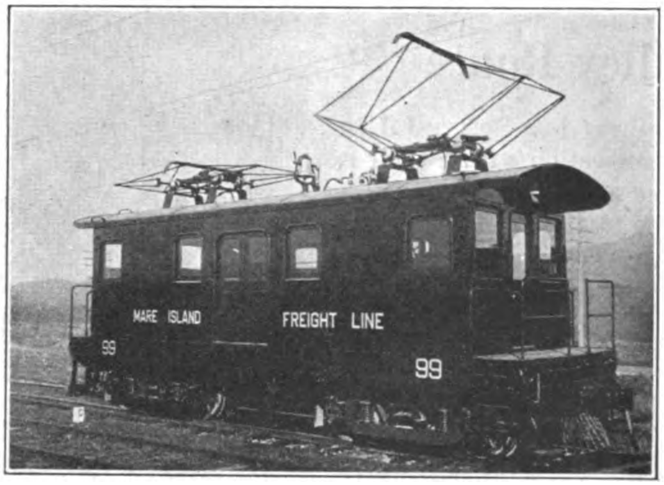
Recent records of power consumption show an average input of 102.4 watt-hours per ton-mile and average output of 64.8 watt-hours per ton-mile at the station, indicating a station efficiency of 63.3. The average power cost based upon the 1.06 cents per kilowatt-hour rate at the power supply busbar was for the same period 5.52 cents per car-mile of passenger service, which comprises most of the traffic.

The average cost of maintaining the No. 0000 feeders, No. 000 trolley, catenary suspension, poles, bonding, including labor and material, for the years 1915 to 1920 inclusive, was $68.60 per mile per year. This is an especially good record when the effects of the salt fog and marine climate are considered. No trouble is experienced from sleet or snow.

The rolling equipment consists of ten combination baggage and passenger motor cars, five trailers, two freight and express motor cars, one locomotive, one motor service car and twenty-two freight cars.



Typical Overhead and Track Construction on the New Cutoff Across the Vallejo Marsh



MARE ISLAND FREIGHT LINE
99
99

FIFTY-TON LOCOMOTIVE EQUIPPED WITH FOUR 100-HP. MOTORS

The standard passenger motor car is 56 ft. over all, seats fifty-four passengers and weighs 47 tons. The electrical equipment consists of four Westinghouse 132-A motors, 100 hp. each, with H.B. double-end control, capable of operating with one trailer at a speed of 50 to 55 m.p.h. The average cost of maintaining these passenger motor cars for the years 1915 to 1920 inclusive, I. C. C. accounts 30 and 33, was 2.83 cents per car-mile. The electrical equipment cost average for the same period was 1.12 cents per car-mile. These costs are shown by years in an accompanying table.

TABLE GIVING THE COST OF MAINTENANCE OF EQUIPMENT, PASSENGER MOTOR CARS, IN CENTS PER CAR-MILE

Year	I. C. C. Account 33 Electrical Equipment	I. C. C. 30 Bodies and Trucks	Total Cost
1915	1.29	1.45	2.74
1916	1.11	1.96	3.07
1917	0.76	1.72	2.48
1918	1.09	1.84	2.93
1919	1.26	1.41	2.67
1920	1.12	1.71	2.83

It has been necessary to purchase but two complete sets of armature coils for the forty 132-A motors since 1908, all necessary repairs being made in the company's shops. The motor cars have averaged about 500,000 miles each since being put in service.

To expedite freight movement to the Mare Island Navy Yard, a causeway was built by the U. S. government between Mare Island and Vallejo. To connect with this, the San Francisco, Napa & Calistoga Railway and the Sacramento Northern Railroad built a 3,000-ft. extension from North Vallejo connecting exclusively with the tracks on the causeway. This extension was electrified, as was also 6,000 ft. of terminal trackage on the island.

To receive cars from the transcontinental railroads a seventy-five car transfer yard was put in at Napa Junction with the Southern Pacific. To move the freight, a 50-ton locomotive was designed and constructed in the company shops. This is equipped with H.B. control and four Westinghouse 132-A, 100-hp. motors. One or more round trips are made over the 7-mile distance as may be necessary. This service was inaugurated on Sept. 20, 1920. Tests show that the locomotive averages 32.8 watt-hours of energy per ton-mile moved at the locomotive.

During 1921 a 3,200-ft. cutoff was constructed north of Vallejo, resulting in the elimination of 53 deg. of curvature. This track was rock ballasted and 75-lb. A. S. C. E. standard rail, continuous joints and bonds on both rails were used. The overhead trolley is of latest catenary construction, the conductor being 22 ft. above the rail.

MAP OF ROUTE

In the general manager's office a Type M graphic wattmeter, 3,000 volts, 800 amp., 2,400 kw., with a curve sheet 2 in. per hour, is installed for checking power consumption. With this device it is possible to tell to the minute when trains leave the terminals and how they are handled by the engineers.

Six through trains are run each way from Vallejo to Calistoga and three additional trains each way between Vallejo and Napa. In addition there is a local service between Napa and Napa Heights, a thirteen-minute run.

Statistics for the year 1920 follow: 661,000 revenue passengers were hauled; the passenger car mileage was 367,000; the freight car mileage was 119,000; the passenger revenue was $298,184, with an average fare per passenger of 45.2 cents; the total operating revenues were $345,812; the operating revenue per car-mile was 71.19 cents; the operating expenses per car-mile were 40.1 cents; the operating ratio was 56.25.

Chinese Cities to Have Electric Railways

Tardy Development of Transportation Systems in the Far East Republic Is Due to the Social as Well as the Economic Conditions of the Country

WITH the exception of the international settlements, such as Shanghai, Tientsin and Hankow, there is no city in China which has electric tramway service. In the settlements mentioned the tramway services have been inaugurated by foreign companies in connection with their municipal concessions. The present condition exists in spite of the fact that there are many native cities in China estimated to have a population in excess of a million and the layout of which appears to be favorable to tramway service.

The greatest single obstacle to the development of street car service in China is said to be the rikisha coolies, who might be called a national institution. These men furnish the popular transportation by means of the two-wheel vehicle known as the jinrikisha.

THE SITUATION IN PEKING

Although Peking, the capital of China, has an estimated population of 2,000,000, including a large foreign population, the installation of a tramway has been prevented largely due to the opposition of the jinrikisha men, who are estimated to number 30,000. A French company has finally succeeded, however, in securing a franchise, in co-operation with Chinese, for a tramway system in Peking. The municipality has overcome opposition by furnishing municipal shops in which the jinrikisha coolies will be trained free in mechanical trades.

The last setback to the execution of the tramway plan was the failure of the Banque Industrielle de Chine, a French bank, which was backing the proposition. When the bank advertised the tramway stock for sale, the issue was immediately oversubscribed, but the bank soon after went into the hands of a receiver. Chinese interests have now succeeded in swinging the proposition, and specifications have been isued for the equipment. According to present hopes the tramway will be a fact within a year.

The Peking tramway system will draw its power from a new power plant to contain one 1,800-kva. and two 900-kva. turbo-generators, equipped with modern auxiliaries. Steam will be furnished by Babcock & Wilcox boilers, with superheaters and economizers. The stokers will be of the chain-grate type, also B. &. W. make. As the water available is liable to form scale, a special evaporator plant will be installed to insure a supply of make-up water of pure quality.

There will be at the outset two rotary converter substations, with rotaries of 225-kw. and 375-kw. capacity, drawing power from the central station at 5,250 volts, three-phase, 50 cycles.

The line to be equipped now will be single track and its length nearly 25 miles. It will be of one meter (3 ft. 3.4 in.) gage. The rails will be of the grooved type, weighing 90 lb. per yard. The entire line will be single track, with forty-six turnouts.

The initial rolling stock will comprise sixty motor cars of the single-truck type. These will be 29 ft. 6 in. long and 6 ft. 6 in. wide, and will have each a seating capacity of sixteen second-class and eight first-class passengers. Each car will be equipped with two 25-hp. motors and will be geared for a free running speed of 10.5 m.p.h. The company has a tender also for thirty 3¾-ton trailers.

The tramway system will be supplied with the necessary shops for maintenance work.

HARBIN WILL HAVE A TRAMWAY ALSO

The second large city in China which has prepared specifications and invited bids for a tramway system is Harbin. The company is Chinese and a Russian engineer is engaged on the details.

Harbin is made up of three sections, the Chinese city, the Russian city and the "new city," separated by considerable distances. The tramway will furnish much needed transportation from one part of the city to the other.

Harbin will also have a special tramway power plant, comprising two 2,500-kw., 6,000-volt turbo-generators, with the usual auxiliaries. Babcock & Wilcox boiler-plant equipment will be used here also.

One substation will be located in "New Town" and the other in the Russian city, while the central station will be in the Chinese city. Each substation will contain two 500-kw. rotary converters with the usual transformers and other accessories.

There will be in Harbin 8 miles of single track, with forty sidings, and meter gage will be used as in Peking. The initial equipment comprises ten forty-passenger motor cars and twenty trailers.

THE PROPOSED TSINANFU TRAMWAY

The third tramway proposition in North China has not yet reached the advanced stage of the two mentioned, but definite plans are in preparation for a system for Tsinanfu. This city is in the Province of Shantung and its population is about 1,000,000.

The promoters here are meeting considerable difficulty due to the fact that the streets are very narrow. Practically the only street wide enough at present to accommodate a tramway is the main street connecting the railway station of the Tientsin-Pukow line with that of the Tsinanfu-Tsingtau line. The present project is to widen the other streets to facilitate the building of the tramway and capital has already been subscribed for this purpose.

The present plan in connection with this project is to secure power from a distance, the idea being to build a power plant at the Shantung coal mines.

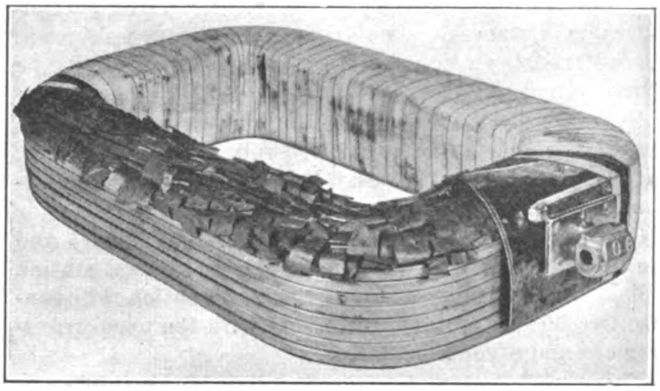
Information available leads to the conclusion that the equipment for the Peking and Harbin tramways will be supplied by American manufacturers, but the Tsinanfu contracts are likely to go to Germany on account of the still great German influence which is exerted in the Province of Shantung.

The information on which the above article is based was supplied from Tientsin by S. Grossbard, industrial and consulting engineer, who has offices in that city and in Shanghai, as well as in New York City.

In the description of the improved Thermit insert rail weld published in the *Electric Railway Journal* for June 3 an error occurred in the original manuscript in the paragraph headed "Nature of Test," under Test No. 2. In the sentence including the words "Two 10-ft. square billets," this should have read "Two 10-in. square billets."

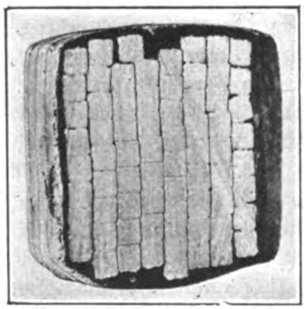
Aluminum Field Coils for Replacing Copper Save 60 per Cent Weight

WHAT is claimed to be an important step in the reduction of motor and car weights has lately been placed on the market in the form of an aluminum wire field coil insulated by a special process. The Lind aluminum field coil was manufactured in Sweden and Germany for nearly ten years before the war. The plants were closed out by the war and the manufacturer, about a year ago, re-established himself in Kansas City. Since that time some fifty electric railways have purchased these coils. The Economy Electric Devices Company, Chicago, has recently been made the general sales agent for this product, which will now be manufactured for general use in the electric railway field.



HOW COILS ARE WOUND WITH PAPER STRIP INSULATION BETWEEN LAYERS

The principal advantages claimed for this coil are high insulation qualities and low weight. It is easily possible, by renewing coils on some cars, to reduce the weight a ton on interurban equipment and 600 to 1,200 lb. on city equipment. The electrical characteristics of the coil are identical with the coils which they replace, coil for coil. The heat-carrying capacity is said to be higher and the external contours and dimensions and terminals are identical with copper coils. In other words, a copper coil may be lifted and an aluminum coil installed without any changes in motor characteristics or any connection or circuit adjustments.



SECTION THROUGH ALUMINUM FIELD COIL

The high insulating qualities are obtained by the use of square aluminum wire corresponding in carrying capacity with copper wire but insulated by a coating of aluminum oxide rather than by cotton. This is said practically to eliminate internal shorts due to overheating or moisture.

The accompanying pictures show the appearance of a main coil for a Westinghouse 306 motor, in section and opened up to expose the paper insulation between layers. This coil is first wound of bare square aluminum wire without separation between turns, but with the clipped paper separating each layer. The terminal arrangement and insulation with mica is similar to copper coils, a tinning with aluminum solder preventing electrolysis at the terminals.

COMPARISON OF COPPER AND ALUMINUM FIELD COIL WEIGHTS

Type of Coils	Weight per Coil: Copper, Lb.	Weight per Coil: Aluminum, Lb.
W. H. 306 Main	42½	17½
W. H. 306 Interpole	23	9
W. H. 506 Main	11	5
W. H. 506 Interpole	13	5½
W. H. 49 Main	46	21
W. H. 121 Main	62½	22½
G. E. 57 Main	103	33¾
G. E. 67-70-80 Main	53	21½
G. E. 55 Large	216	56½
G. E. 55 Small	127	32¾
G. E. 58 Main	68	28
G. E. 73 Large	147	38½
G. E. 73 Small	114	21
G. E. 201-G Main	44	20
G. E. 216 Interpole	25	10½
G. E. 203 Main	51½	20¾
W. H. 92-A Main	64	22
A. C. I. R. 50	69	29
G. E. 264-A Interpole	10	4½

After being wound, the bare coil is heated and then immersed in the oxidizing solution. Next it is heated and dipped in an insulating varnish solution. Then it is externally wrapped with webbing, oiled bias linen, and again with webbing. The final treatment is dipping and baking in the insulating varnish.

The manufacturer states that none of the more than 500 coils in service in this country during the past year has yet had an internal failure, and there have been but three cases of external failure, all of which were due to mechanical damage of the wrapping.

Letter to the Editors

Trackless Trolleys Don't Injure Pavements

CITY OF NEW YORK
DEPARTMENT OF PLANTS AND STRUCTURES
NEW YORK, June 26, 1922.

To the Editors:

My attention has been called to an anonymous letter in your issue of April 29, headed, "The Ruthless Trackless Trolley. It is is Destroying the Roads."

I am sure that you will be glad to be advised that this is absolutely untrue, and to print the facts.

The letter referred to is based upon appropriations for paving two public streets on Staten Island over which this department is operating trackless trolley lines. Here are the facts.

Bradley Avenue, over which a line to Sea View Hospital operates, has never been paved. It is a dirt road surfaced with macadam. The layer of stone is so thin that every spring the water from the hillsides wells up through the roadway. The trackless trolley cars did not destroy this road, they merely encountered an annual condition incident to the spring thaws. The Board of Estimate has decided to lay a concrete roadway on Bradley Avenue. This is an improvement that would have been necessary without the trackless operation.

Richmond Turnpike has a concrete roadway from Meiers Corner to Bulls Head. It was intended to continue this concrete highway to Cartaret Ferry Terminal at Linoleumville long before the trackless trolley system was thought of. The appropriation for this work, therefore, is not the consequences of the trackless trolley operation, but I did ask to have this work hurried in order to provide better going for trackless trolley cars.

This highway is one of the two arteries for automobile traffic crossing Staten Island to points in New Jersey and beyond and it would have to be properly paved whether or not there were any trackless trolley cars in existence.

The city of New York has not found that "there is virtue in trolley tracks." On the contrary, they are an obstruction. Good pavements cannot be maintained on highways on which trolley tracks are laid. It is misleading to argue that "good roads cost as much as good tracks." The cost of the tracks is an added factor. Why make this additional and unnecessary outlay? The trackless system developed by this department is a practical economy in that it saves the entire cost of track construction, reduces the cost of maintenance of the pavement and makes the whole area of the pavement available for vehicle traffic. GROVER A. WHALEN,
Commissioner of Plant and Structures.

The Passenger-Density Idea of Service Standards

NEW YORK, June 22, 1922.

To the Editors:

The difficulty of using any particular standard automatically to define good service is brought out not alone by the fantastic no-seat no-fare ordinances that mushroom occasionally, but also by regulations that have been most carefully thought out. As an example of the latter kind take Memphis, whose practices were detailed in the May 13 issue of the *Journal*. There the standard of service is set at "not less than 0.155 nor more than 0.185 passenger car-miles for each revenue passenger carried" or, stated conversely, the passenger density per car-mile is permitted to vary between 6.4 and 5.4.

Naturally, this was worked out only for Memphis conditions as to needed frequency of service, capacity of car and other factors. For general acceptance it would certainly not do even as well as the cruder rules which set service standards by defining the longest headways in off-peak hours and the permissible proportion of standing to seated passengers in rush hours. The trouble with these and other schemes is that they are likely to penalize a railway which discovers that there are ways and means of filling empty seats through building up off-peak travel.

The passenger car-mile effect of the weekly pass in Youngstown is a case in point. In the weeks of September, 1921, immediately preceding the pass, the rides per car-mile ranged between 4.90 and 5.11; by March and April, 1922, they had risen to 6.5. So far from representing a decrease in the quality of the service, there was actually a considerable improvement in the off-peak headway of certain routes through the addition of safety cars. What happened was this: Only 15 per cent more car-miles with smaller cars had been added to meet a 50 per cent increase in riding, but loading standards did not suffer because by far the greater part of the increased riding had come in the off-peak hours. While the density per car-mile indicates less service, the shortening of the headway really produced greater service. So, in this instance, recourse to the Memphis plan would be misleading. If the loading of electric railway cars was fairly consistent through all the hours of the day, the density plan would be self-explanatory, but as the loading of electric railway cars is of most disheartening inconsistency, we must seek supplementary methods for judging a management's ability as well as the character of its service. What better method can there be than its attraction of more and more customers at livable rates of fare? Surely, any demonstrated increase in traffic secured during the hours when people do not have to use the company's service is pretty good proof that the people are satisfied with that service. WALTER JACKSON.

Strict Discipline Advocated by Employee

PORTLAND, ORE., June 15, 1922.

To the Editors:

It seems to be a popular theory that most men engaged in operating trains or cars resent strict discipline and equipment examinations. This is a mistake. Judging from a twelve-year contact with fellow employees on street and interurban electric railroads, I wish to say that the majority of the men believe in strict discipline and technical examinations. I know this because I have talked with trainmen on this subject in various parts of the country.

There is a reason for this. A man working for a road that insists on its rules being obeyed and that also requires him to take technical examinations is more proud of his job. He feels it requires a special effort on his part to get and hold this job. However, if conditions are the opposite, he rapidly gets into a rut and is interested only in drawing his pay for the least possible effort. This of course is bad for the company and the employee as well, and never fails to end in time with the expenditure of many hard-earned dollars for accident claims, etc.

Furthermore, on a road with lax discipline, where say 75 per cent of the men disobey certain rules frequently, it is almost impossible for the other 25 per cent to obey them and get the trains over the road. In fact, many times it is impractical and unsafe for a minority of men to obey the rules. I have seen serious accidents caused by one train crew obeying the company's rules and another running its train according to its own ideas, the conflict between the two methods causing the wreck.

There are two kinds of discipline, the kind applied by a superintendent who believes in kindness and fairness and the kind where the superintendent rules with a mailed fist. I believe the first method is the best; that is, if the superintendent does not allow his kindness to supplant firmness!

I have always advocated strict discipline and equipment examinations, because that is the right way—the way that saves lives and dollars.

GEORGE W. BOOTH,
Interurban Motorman.

Trainmen's Guide Book

THE Pacific Electric Railway in the intensive operation of its 1,100 miles of interurban and local street car lines in four counties in southern California, in Los Angeles and some fifty-two surrounding cities and towns has just issued a new 260-page guide book containing the names and locations of stops, cross streets, churches, theaters, banks, parks, and all other points of interest on or adjacent to lines of the company. The book is being distributed to all conductors and agents to enable the furnishing of accurate information to the public. This guide was compiled by the passenger traffic department of the company under the direction of O. A. Smith, passenger traffic manager.

Electric Railway Publicity

Devoted to How to Tell the Story

Smoothing Over the Little Things

R. N. Hemming, Superintendent of Transportation of the Indiana Service Corporation, Tells How His Company Does It

By Frank H. Williams

When the Indiana Service Corporation, Fort Wayne, Ind., gets kicks on its service or anything of that sort, R. N. Hemming, the superintendent of transportation, makes personal visits to the kickers to iron out the difficulties. Visits of this kind take a lot of time. Moreover, they appear to be an expensive proposition until it is realized that on practically every such visit a kicker is turned into a booster for the company.

Recently when this corporation started its new weekly pass system some patrons felt they had real grievances when the car operators refused to give them transfers unless they asked for them at the time of paying their fares.

"Of course," said Mr. Hemming, "our side of the case was perfectly sound, but not all our patrons could see it. Before the start of the weekly pass system our car operators had been allowed to become quite lenient in the matter of giving transfers. In fact, in many instances this leniency got to the point where at transfer points the operator was not only busy taking in fares, but was also busy giving out numerous transfers to folks who forgot to ask for them at the time of paying their fares.

"But with the starting of the weekly pass system we had to stop all this. It is plainly evident that since we gave no transfers on passes, the operators could not be asked to distinguish among the passengers those who had come in by passes and those who had paid their fares in cash or tokens. So if the operators had been allowed to continue giving transfers after the time fares were paid it would have been an easy matter for persons with passes also to get transfers.

"Consequently we issued airtight rules that no transfers were to be issued except at the exact moment of paying fares.

"As the result of this ruling we got some kicks, but not such a great number at that. Among the kickers was a prominent Fort Wayne merchant who had been refused a transfer and who as the result of this refusal told us he was going to dispense with our light and power in his store. He declared that he had a perfectly legitimate kick because he had been riding on the same line with the same operator at the same hour of the day for months, the operator knew him perfectly and knew that he did not have a pass, but paid his fare by tokens.

"I went around to see this man and this is the way I put the proposition up to him:

" 'By forgetting to get your transfer at the time of paying your fare you are out 7 cents, or a token. But if that car operator had discriminated among all the passengers and given you a transfer when he refused it to other passengers under similar circumstances it might have cost him $15.

" 'You are a big employer of help. You realize that your business must be conducted in an orderly, systematic manner. You know that you must have certain rules and regulations which must be strictly followed by the people you employ. If they didn't follow these rules you know that your store would soon be disrupted and your business shot to pieces. The same thing holds true with us. We've put this rule into effect for good reasons and we are enforcing it with suspension which means real cash to the operators. So you can see just why that operator refused to give you that transfer. It meant bread and butter to him to abide by our rules and not discrimination in your favor. So you see that eliminates this operator and brings your kick right up to the company itself.

" 'Now I am going to tell you just why the Indiana Service Corporation has been forced to make the car operators live up to this rule of ours of refusing to give transfers to people after the time they pay their fares.

The Kicker Convinced

" 'I think you can plainly see that we cannot afford to give transfers to people who carry weekly passes. These passes entitle people to ride at any time, anywhere on local lines. Consequently it costs them nothing to transfer from one line to another. They simply show their passes a second time. Suppose, now, that we did give transfers to people who owned passes. What would then happen? These pass owners, having no use for the transfers themselves, might drop them on the street or give them to friends or relatives, thus allowing people who had paid no fares and bought no passes to ride on our car lines and in this way cut down our revenues.

" 'If operators were allowed to give transfers after the time passengers had paid their fares it is evident that pass owners might impose on the operators—who, of course, couldn't remember which passengers had paid cash and which hadn't—and in this way secure transfers to which they were not entitled.

" 'Now, further, I think you will agree with us when we say that this rule must be enforced strictly with all passengers. We cannot discriminate and say that the rule must not be enforced against YOU, for instance. To start such discriminating would soon arouse such a storm of protest that all the good will we have built up for the company would be swept away. If you, for instance, should issue orders that certain of your customers were to be discriminated against in favor of others, you'd soon drive away all your other customers, wouldn't you? You understand the point. It isn't necessary to say anything more about it.

" 'And now,' I concluded, 'I hope I've made the whole thing clear.'

" 'You sure have made it clear and your operators and your company are absolutely right about it. If I forget to get my transfers at the proper time after this I'll simply pay my extra 7 cents and forget it.'

"Of course we'll have no further kicks from this individual. And, in fact, it is pretty certain that from being a kicker he will now become a consistent and constant booster for our company.

"That's the big value we find in going out and having personal talks with folks who kick on our rules or regulations or on our service. By doing so we give the company a personality which it may never before have had to the kicker. The kicker may have considered the company merely a soul-less corporation and may never before have realized that the corporation is made up of a lot of earnest men trying to give the public good service. This makes the kicker sit up and take notice. And then when we go over his kick carefully and show him where he's wrong or how we have changed things so he has no further cause for kicking, or iron out the difficulty in some reasonable, satisfactory way, we nearly always make boosters out of the kickers."

The company has gone even farther than this. Recently it got out a little booklet giving the schedules for the different lines, telling when the first and last cars leave the ends of the lines, how frequently the cars run and so on. And this booklet is just to give the right information to the few people who still seem to believe that cars are run at the caprice of the operators or the executives and not on schedule.

"Personal calls on kickers," concluded Mr. Hemming, "are a splendid way of smoothing out knockers and increasing the good will of the general public for the corporation."

Aren't there some suggestions in all this for the executives of other companies?

Meet Mr. Passerkin of Youngstown!

WHEN the Youngstown (Ohio) Municipal Railway decided to introduce the unlimited-ride, transferable weekly pass, Garret T. Seely, president, must have suggested to Frank Wert, manager of the department of public relations, that he go ahead and push the pass as if the company really believed in it—and Frank did and has continued doing so with a new slant or slope every once in a while to keep interest at pass-buying heat.

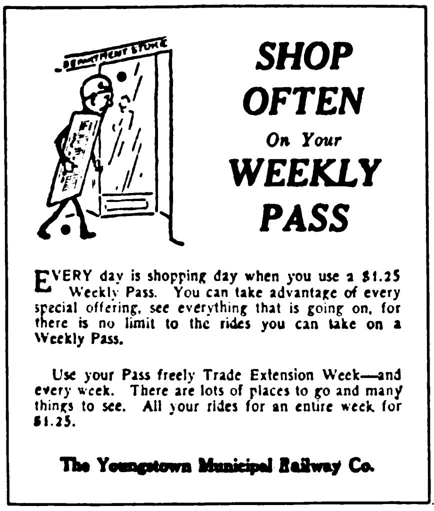
First, of course, came the introductory newspaper advertisements preaching the doctrine of a wholesale price for wholesale use. Just 4,211 patrons fell under the spell in the first week (Oct. 3, 1921) and put down their $1.25 in advance of a week's riding, and having done so, they naturally refrained from taking a jitney just because the street car was a block or two behind.

Second, came and continued a series of car-window placards through which Frank Wert finds new reasons for using the pass and for boosting every worth-while cause that comes along—be it go-to-church Sunday, the Community Chest, the ex-Service Men's Employment Bureau, the flowers that bloom in the spring at Idora Park, etc. And don't those boosts make friends! Just mention going back to the old "buy-a-ride-at-a-time" scheme and hear what the Youngstowner will splutter in protest.

Third, was a series of newspaper advertisements through the fall and winter, telling owners of private automobiles a great many sound reasons why a pass for all the rides they wanted at $1.25 a week was better than freezing their noses and batteries in the cold blasts. This advertisement must have been effective, for even as late as the week beginning May 1 the pass actually hit the record sale of 7,211. Seems to show that Frank's advice about "Your pleasure car for pleasure, your street car for business" has hit home. In fact, the pass has helped to make the street car a pleasure-riding proposition, too.

And now comes his latest idea—a personality whom we will name Mr. Passerkin, since he personifies the possibilities of a person with the pass. Observe the bright little newcomer. His body is rather rectangular and his legs rather spindly, but then he doesn't have to walk a block, you'll remember. His cap, being the famous Phrygian liberty top-piece, is decidedly apropos because freedom to board any car any time any distance is the pleasant privilege of every passholder. Mr. Passerkin is making his appearance in 4½-in. x 5-in. newspaper announcements. In one, he is seen enjoying 100 per cent Passerkin home cooking for luncheon; in a second, he is slipping into a department store to give some bargains the once-over or several times over, as it costs no more for fare to do the latter, and in a third he tells the Youngstown world that the pass is good for every purpose and that it is transferable, too.

Yes, sir, even the press-famed Mayor Oles has told the citizenry that the more they patronize the street railway, the better the chance of getting a lower fare. Selah!

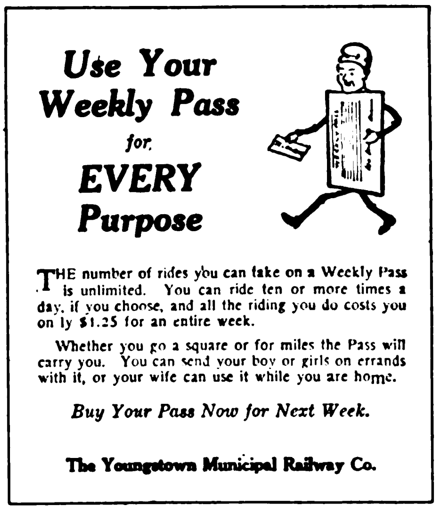


SHOP OFTEN On Your WEEKLY PASS

EVERY day is shopping day when you use a $1.25 Weekly Pass. You can take advantage of every special offering, see everything that is going on, for there is no limit to the rides you can take on a Weekly Pass.

Use your Pass freely Trade Extension Week—and every week. There are lots of places to go and many things to see. All your rides for an entire week for $1.25.

The Youngstown Municipal Railway Co.



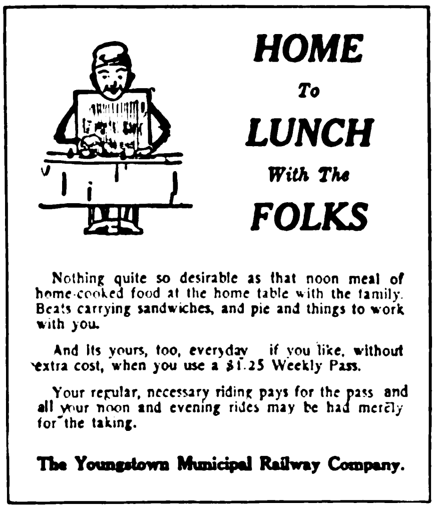
Use Your Weekly Pass for EVERY Purpose

THE number of rides you can take on a Weekly Pass is unlimited. You can ride ten or more times a day, if you choose, and all the riding you do costs you on ly $1.25 for an entire week.

Whether you go a square or for miles the Pass will carry you. You can send your boy or girls on errands with it, or your wife can use it while you are home.

Buy Your Pass Now for Next Week.

The Youngstown Municipal Railway Co.



HOME To LUNCH With The FOLKS

Nothing quite so desirable as that noon meal of home-cooked food at the home table with the family. Beats carrying sandwiches, and pie and things to work with you.

And its yours, too, everyday if you like, without extra cost, when you use a $1.25 Weekly Pass.

Your regular, necessary riding pays for the pass and all your noon and evening rides may be had merely for the taking.

The Youngstown Municipal Railway Company.

A FEW OF THE EFFECTIVE ADVERTISEMENTS USED IN THE YOUNGSTOWN CAMPAIGN

Transit Planning for Cities*

The Author Declares that Transit Development Should Precede Population and Outlines the Extent and Nature of Transit Routes for a City

BY DANIEL L. TURNER
Consulting Engineer to the Transit Commission of New York City

FROM a transit standpoint, our cities are planned today very nearly as they were 100 years ago, when people were living in a man-and-horse civilization. When street railway transit superseded foot transit, then the street railway system rather than the street system should have been accepted as the principal circulating medium of the town, and the town should have been planned and constructed accordingly. But this was never done. The town authorities in the old days failed to recognize this principle—and even today in our time, those responsible for the planning and development of our cities have not grasped the full significance of this principle and its importance with respect to the comfort, health, happiness and economic welfare of the community.

City transit should precede the population—not follow the population. This is the fundamental basis of a proper transit development. This principle means that when it becomes necessary to open up a new area for the growing population, the transit system and the street system should spread out over the new territory simultaneously; the two systems should expand together. Then the other services, such as water, sewers and light can follow.

It may be assumed that a city will be conveniently served if a prospective passenger is not required to walk more than a quarter of a mile—or walk longer than five minutes—to reach a surface line, either a motor bus line or a street railway line, routing towards the business center, which is the objective point for most of the traffic. This means that the lines would be about half a mile apart in the residential districts. For crosstown service, lines one mile apart will conveniently serve the community.

In the case of subway or elevated lines, that is, rapid transit lines, if the lines routing to and from the center are 1 mile apart, and the crosstown lines are 2 miles apart, convenient rapid transit service will be afforded the community; everyone could reach a rapid transit line within a ten-minute walk. The surface lines and the rapid transit lines would route closer together than described above as they approach the business center, to the extent of traversing every street in extreme cases.

ROUTES

A study of most of the larger cities indicates that they conform closely to the semicircular shape and can be included within a 6-mile radius. For this reason an analysis of the route mileage standard can be based on the theoretically semicircular city. Such a semicircular city of 1 mile radius contains an area of approximately 1,000 acres, and the area increases as the square of the radius; so, squaring the radius in miles and multiplying by 1,000 will produce the approximate acreage of any semicircular city.

Upon this basis, it would require approximately 1 mile of motor bus or street railway line, or route, for every 200 acres of city area. In the case of a single track, with the average sidings, this would reduce to 1 mile of single track for every 180 acres; or in the case of a double-track line (neglecting yards, etc.), one mile of track for every 100 acres. Usually the acreage served by 1 mile of track should be between these limits.

For rapid transit lines the corresponding standards are: One mile of rapid transit route for every 400 acres of city area; and 1 mile of rapid transit track for every 200 acres of city area, assuming a two-track line.

The next important factor is the routing of the transit lines, or number of routes. By a route is meant a continuous line, either from the business center to the outer limits of the city, or crosstown (or circumferentially) from one side to the other of the city. In the former case, such a line would serve a strip of territory a half mile wide for a motor bus or surface line and 1 mile wide for a rapid transit line, and would connect the residential section traversed directly with the business center; in the latter case, a crosstown strip a mile or 2 miles in width would be served, by surface and rapid transit lines respectively, thereby conveniently connecting every part of the city with every other part, with one or two transfers.

The number of routes is another measure of the accessibility or convenience of the service. The theoretically semicircular city again will be used as the basis for determining the standard.

For motor bus lines and surface car lines approximately the number of routes can be obtained by extracting the square root of the city acreage and dividing by 6.3. For rapid transit lines, the square root of the city acreage divided by 12.6 will give the number of routes approximately.

The routes should be distributed throughout the city so as to furnish the same character of service to all sections. The up-and-downtown routes should be as direct as possible. Their function is to provide quick transportation between home and work. As far as practicable, up-and-downtown routes serving opposite sides of the city should traverse the business center crosstown-wise through the same street. In this way one pair of tracks in the congested area would accommodate two pairs serving opposite residential sections; that is, for every four outlying tracks only two tracks would be required through the business center. In the morning and at night both such tracks would be utilized by loaded cars with workward-bound passengers in the morning and homeward-bound passengers at night. This constitutes the development of a two-way traffic through the business center and consequently is the most economical use of the streets within the congested area.

Ideally arranged, the central pair of up-and-down routes would penetrate farthest downtown, across all of the cross-wise business streets, except the one nearest the water-front, which would be traversed by the crosstown connection for two-way traffic above described. Thus the movement of the cars would be along a U-shaped route downtown on one side, across town through the business center and then uptown on the other side. The pair of routes next removed and on either side of the central pair would continue downtown as before across all of the crosswise streets to next to the last one. [This U-shaped arrangement would be continued as needed, the U having a continually wider spread and the bottom higher up.] With this route arrangement a passenger could reach almost any point in the business section by one transfer from his own up-and-down line.

The cross-town lines are for a different purpose. They will be used by transfer passengers chiefly. They should run directly across-town and thus intersect all up-and-down lines. Their function is to articulate the entire railway system. By means of them a passenger will be able to reach any point in the city from any other point.

---

*A portion of a paper read before the National Conference on City Planning, Springfield, Mass., June 6, 1922.

National Committee to Consider A. E. R. A. Standards

THE American Engineering Standards Committee has notified the iron and steel, lumber, electrical, construction, chemical, railway and railway supply industries of the importance of the standardization program initiated by the American Electric Railway Association in submitting thirteen standards for approval.

The specifications submitted to the A. E. S. C. follow:

For approval as American standards:

Nine-inch girder grooved rail.
Seven-inch girder grooved rail.
Nine-inch girder guard rail.
Seven-inch girder guard rail.
Joint plates for 7-in. girder grooved and girder guard rails.
Joint plates for 9-in. girder grooved and girder guard rails.
Specification for galvanizing or sherardizing on iron and steel.

For approval as tentative American standards:

Seven-inch 80-lb. plain girder rail.
Seven-inch 91-lb. plain girder rail.

For approval as recommended American practice:

Specification for materials for use in the manufacture of special trackwork.

Specification for 600-volt direct-current overhead trolley construction.

Four special committees will be appointed by the A. E. S. C. to determine whether the A. E. R. A. specifications are the standards which should be adopted for universal use in the United States; the committee's decision will, of course, be predicated on its finding as to the desirability of national standardization of the products enumerated. The principal organizations concerned will be asked to name representatives on these special committees.

Meanwhile, the American Engineering Standards Committee requests the technical press, industrial associations, and technical bodies interested in these specifications to send to its headquarters at 29 West 39th Street, New York City, any available information as to the extent to which these specifications are meeting the needs of the industries concerned.

Electric Railways Have Unique Possibilities for Employee Training

Little Uniformity in Employee Training Systems Is Shown in Reports Based on Data Contributed by Fifty-six Electric Railways—Scope of Instruction Criticised as Being Too Limited

A BRIEF summary of the outstanding features of employee training on the electric railways of the United States and Canada was recently issued by the Industrial Relations Association of California. In the preface it is stated that emphasis is laid especially upon those features which are capable of universal application. The report is based upon data contributed by fifty-six of the largest electric railways in the section covered. The substance of the report is as follows:

The electric railway field occupies a very advantageous position in its possibilities for the training of novices. It is not hampered by a multiplicity of jobs with a mere handful of men on each type of job.

PRESENT LACK OF STANDARDS

Because of the unique opportunities for training which exist in this field, it would seem that the training of the men would already have arrived at a very high stage of development. This, however, is not the case. There seems to be very little uniformity in the training systems. In fact, the arrival at anything like a standard procedure in "breaking in" the men seems to be in the distant future.

A free interchange of data on various systems of training the men is very highly desirable, and if it were undertaken seriously and systematically, the result ought to be the elimination of much of the guesswork and haphazard effort which now obtain. If there is any best way of training men, the discovery of this way would be distinctly useful to electric railways all over the country. It is not the purpose of this report to present a logical plan for training platform men, but instead, to point out here and there the various features which seem to have been studied out with the most care and to be most fruitful of results.

SELLING THE JOB

One company does a unique thing in that it places at the very beginning of its instruction book a carefully worded discussion of the merits and demerits of the platform man's job. First, the advantages of the job are discussed; then the disadvantages with appropriate counter arguments. In addition some very helpful information is given which is designed to help the new man in adjusting himself quickly to the work.

A number of the larger systems maintain schools of instruction in which there are charts, diagrams, apparatus, skeleton cars, practice dummies, etc. In most cases the students receive their first instruction in these schools before they are put out on the lines. The school is presumably in charge of a carefully selected chief instructor, whose duty it is to see that each student is started out in the best possible manner.

The student platform men are usually supplied with rule books, but are too frequently left to their own devices in mastering the contents. Some systems require the students to study the rules carefully before going out upon the lines. One company issues a set of rules in which each rule is followed by an explanation and a reason for its necessity. Such a feature is certainly commendable. Some companies make the study of rules an integral part of the school of instruction, and in such cases it is possible that a thorough analysis of the rules is made.

Very few companies seem to make a serious effort to use simple readable English in the instructions and circulars of information which go out to the rank and file employees. It is hard to overestimate the importance of making all such publications as simple as possible, and the whole matter merits considerable thought.

TIPS TO THE STUDENT

It is the custom in a few systems to give each student in training a questionnaire to study which is quite similar to the one he must answer when he takes the final examination. The chief value of this lies, apparently, in that it calls to the student's attention the scope and nature of the field he is expected to master, and it emphasizes the important points he must familiarize himself with.

At least one company thinks it is worth while to put the student back on the instruction car for a half day near the end of the training period. The purpose is to break up any incorrect practice which the student has developed up to that time.

It is a prevalent evil among teachers everywhere to attempt to substitute impression for expression. Instructors try to teach a student by simply telling him. That will not do; he must be allowed to practice; otherwise he cannot know how it feels to do a thing, and it is that feeling which counts most. In order to give student motormen plenty of practice, some schoolrooms are equipped with sets of dummy brakes and controllers. Practice on the skeleton cars is also permitted to some degree. In a few systems there are pieces of track rarely or never used, or specially laid for the purpose, on which students are made to practice. This saves the passengers from jolts and permits the student to make good preparation for later experience in passenger traffic. One system adds a third step in the practice stage by sending the students with their instructor out on the regularly used tracks in a special car which does not haul passengers.

EXAMINATIONS

Written final examinations are customary in a great many systems. Most of these examinations are conducted with a stock set of questions. In a company or two, the student is given a copy of the examination questions beforehand as an incentive to a mastery of the rule book. Occasionally the written examination includes copying schedules, copying running time, and making out accident reports. Usually the written examination is supplemented by an oral examination. Actual performance in car operation on the practice track and the locating of car troubles form a part of some examinations. In one system at least, the student is required to operate in a congested district as a part of his final test.

At least one system holds a promotional examination every six months, by means of which all the platform men are grouped into classes 1, 2 and 3. Only those in Class 1 are eligible for promotion to the position of inspector, starter or instructor. All employees are expected to take these periodical examinations.

PERSONAL HELP

Naturally, all the training systems are aimed at making the platform man an effective working unit in the organization, but there is one system which attempts to secure this result in a new way. In its printed materials for students it includes suggestions as to how to make extra money, i.e, by arranging with the regular men to act as substitutes for them on their days off. This specific suggestion might not fit into any other railway organization, but the general idea seems good, for what makes an employee more contented and, therefore, more effective on his job than opportunities to make a larger income? Some companies attempt to help get their new employees comfortably housed at a reasonable cost conveniently near to the carhouse.

The man who can do best is not necessarily the man who can teach best. The instructors of students need to be carefully selected and carefully trained. Some companies show a real appreciation of these points and have taken definite steps toward more systematic instruction. Some have schools for instructors. Several have drawn up standard lessons for instructors, showing not only what points and operations the students are to be taught, but also the order in which they are to be taught, i.e., what is to be taught on the first day, what on the second day, and so on to the end of the regular training period. Some methods tend to develop the "one best way" of teaching the various steps in the learning process and to prevent an instructor from "going to seed" on one particular thing, to the neglect of other phases of training.

As may be expected, the larger systems are doing the most in the way of comprehensive training; however, there are still too many in this class who have a long way to go. The chief criticism of present training in general is that it does not include enough. It leaves too many things for the new man to pick up for himself in an incidental desultory fashion.

Slovenly training methods do not attract capable men and if this work is to hold the type of man who is later to develop into supervisory and executive timber, the type which will "carry on" and help the electric railway retain its proper place in the transportation world, then the present executives in charge must see to it that they establish training procedures which will call out the best there is in the man at the bottom.

It is not within the scope of this report to show how the personnel of electric railway systems should be handled, but it is evident from this study that very much more concentrated thought and effort on the subject is sadly needed. Until the street railways cease to leave the matter to the incidental attention of busy executives who have not had the opportunity to familiarize themselves with proper training methods, and establish training departments with specially qualified managers in charge, no new or conclusive results may be hoped for. To say the very least, every electric railway ought to have a man in charge of training who knows as much about training as the average school principal, and who knows something about electric railway operation besides. With such a change in the organization of the individual companies and provision for the interchange of ideas mentioned the first great step in the practical solution of training problems will have been taken.

Buses Major Topic at Meeting of Iowans

Bus Industry Must Come Under Regulation, says Chairman of Iowa Commission—One-Man Car and Pass System also Discussed

THAT the Iowa Railroad Commission is not unmindful of the competition with electric railways on the part of motor buses, but is without power to regulate the buses, was the assertion of Dwight N. Lewis, chairman of the Iowa Railroad Commission, at the joint session of the Iowa Electric Railway Association and the Iowa Section of the National Electric Light Association at Lake Okoboji, Iowa, on June 20. That the motor bus is a permanent institution with a definite field is the belief expressed by Mr. Lewis, but he said that it must come under regulation and that the existing conditions leading to unfair competition must be eliminated. Unless the electric and steam railways can find some way to handle the short-haul freight promptly they must expect to face competition from the motor truck for an indefinite period was also a statement made by Mr. Lewis.

In the discussion of the subject of motor vehicles using the highway to handle freight and passengers, which took place at the session of the railway association in the morning, F. J. Hanlon, general manager Mason City & Clear Lake Railroad, Mason City, laid stress on the lack of any responsibility on the part of motor bus companies in maintaining the highways, which he said were being rapidly destroyed by the buses. His remarks referred principally to the use of paved roads, since the Iowa experience he cited seemed to indicate that these buses had not been able to operate successfully on the dirt roads of the state. Even on the paved roads he cited incidents that seemed to indicate serious losses on the part of the companies trying to operate.

The light-weight one-man car came in for a great deal of favorable comment. The short discussion indicated that the light-weight car is a thorough success, with developments in the way of light cars for interurban service that promise success. E. C. Allen, general manager Cedar Rapids & Marion City Railway, said that with 100 per cent one-man operation, including the operation of a 5-mile interurban line between Cedar Rapids and Marion, no serious difficulties of any kind were encountered. On the heavier type cars used on the interurban line one-man operation had proved as feasible as in the city service. Accidents had been reduced 57 per cent, he said, and there were no platform accidents. J. M. Drabelle, Iowa Railway & Light Company, cited reductions in substation demand of from 400 kw. to 200 kw. and reductions per car-mile from 4.9 kw.-hr. to 1.9 kw.-hr. as examples of the savings possible.

L. R. Brown of Rock Island described the identification card fare scheme in use in Mason City, which has apparently met with considerable success. Identification cards good for one month were sold at the start for $1, but the price was later reduced to 50 cents. The holder is then entitled to ride for a 5-cent fare. A somewhat less revenue per ride is obtained from the passengers using the card than from passengers paying a 10-cent cash fare. A saving in time of making change and handling passengers, enabling the maintenance of schedules in better form and an apparently better reception of the identification card and its 5-cent fare over the 10-cent cash fare in use on the same lines are some of the advantages ascribed to the method used.

W. G. Dows, general manager Iowa Railway & Light Company, described a method under trial in which a monthly pass is sold for thirty-day periods for use on one of its interurban lines. The price is figured so that it will produce a revenue of 2 cents per mile on sixty rides per month. Experience seems to indicate that the number of rides on these passes averages fifty-seven to fifty-eight per month. Some questions were raised in the discussion as to the feasibility of using buttons for identification purpose in place of the cards, which are objected to by many on account of the inconvenience of handling. Business men seem to be the principal objectors. The expense of any other form of identification that it has been possible to devise it too great to permit its use was the answer made to the questions.

GROUP INSURANCE DISCUSSED

In the joint session on Tuesday afternoon Peter F. Bouquet of the Metropolitan Life Insurance Company discussed group insurance as a means of restoring or improving the relations with employees. If a man's regard for his family can be tied up to his daily work, he said that the three factors of brain power, muscle power and good will can be co-ordinated to secure the greatest good for both employer and employee. Group life insurance is available only for employees of a single employer and not for clubs or similar organizations, and, according to the speaker, many men who otherwise could not secure insurance at any price could be covered under group insurance. The premiums are usually paid by the employer, though in some cases joint arrangements for handling the premiums are made. F. J. Hanlon spoke enthusiastically for the plan, asserting that it had accomplished all that Mr. Bouquet had claim for it.

The officers for the past year were re-elected for the coming year, except that O. H. Simonds, general manager Dubuque Electric Company, replaced E. C. Allen, general manager Cedar Rapids & Marion City Railway, on the executive committee.

New York Association at Bluff Point

Annual Outing and Business Conference Draws Large Gathering at Charming Lake Champlain Resort—Commissioner Attwill of Massachusetts Makes Hit—B. E. Tilton Elected President

THREE hundred members and guests of the New York Electric Railway Association met on June 24 at Hotel Champlain, Bluff Point, for a day's recreation and the transaction of association business. This was the fortieth annual meeting. The reports of President W. O. Wood and Secretary-Treasurer W. F. Stanton, presented first, showed that an active year's work had been accomplished, with a substantial cash balance in the treasury to be carried over to the coming year. B. E. Tilton's report, for the membership committee, showed several additions to railway and manufacturer membership during the year.

T. C. Cherry, for a committee on changes in the constitution and by-laws, next recommended that the number of vice-presidents be increased from two to three and this recommendation was approved.

Two papers were then read by title, as follows: On "Tax and Paving Requirements Now Imposed on Street Railways and the Resulting Unfairness and Discrimination," by Alfred T. Davison, general counsel Third Avenue Railway System, New York City, and on "The Personal Factor in the Electric Railway Industry," by Clinton E. Morgan, general manager Brooklyn (N. Y.) City Railroad. The papers are abstracted elsewhere in this issue.

On recommendation of W. H. Collins, chairman of the nominating committee, the following were elected to serve for one year: President, Benjamin E. Tilton, vice-president New York State Railways and general manager Syracuse-Utica lines, Syracuse; first vice-president, Edwin Duffy, president the Cortland County Traction Company, Cortland; second vice-president, C. E. Morgan, Brooklyn; third vice-president, W. J. Harvie, vice-president and general manager Auburn & Syracuse Electric Railroad, Auburn; secretary-treasurer. W. F. Stanton. assistant to the president New York State Railways, Rochester. Executive committee, officers and the following: Frank Hedley, president Interborough Rapid Transit Company, New York; H. B. Weatherwax, vice-president United Traction Company, Albany, and Schenectady Railway; James F. Hamilton, president New York State Railways, Rochester; H. G. Tulley, president International Railway, Buffalo.

Commissioner Attwill Speaks Plainly on Electric Railway Situation

The annual banquet was a brilliant affair, an unusually large number of ladies being present. Mr. Wood acted as toastmaster. He introduced Hon. Henry C. Attwill, chairman Massachusetts Department of Public Utilities.

Mr. Attwill said that while the utilities of the country are undoubtedly in a difficult situation, it is largely up to electric railway men now to restore conditions to normal. A common question is: "What is the matter with the electric railways?" The cause of the difficulty is not automobile competition, except possibly in openly settled territory. In fact if the electric railways in the large cities were suddenly called upon to carry the people now riding in automobiles they would fall down. In Mr. Attwill's opinion the answer is that the electric railway status is an aftermath of the war. During the war there was a general expansion of credit, with consequent inflation of prices and reduced purchasing power of money. In this connection all utilities which were under control as to rates were called upon to give service under cost. The public thus became indebted to them and ought to be willing now to liquidate this debt caused by war conditions.

Under wartime conditions, said Mr. Attwill, utility operators were reluctant to try for increased rates, but when they did so such increases were usually denied. The public must now square the account or repudiate an obligation owed to the utilities. To insure the payment of this obligation is the problem just ahead. Such a consummation suggests the figure of the silver lining on the other side of the dark cloud. There is this to be said about wartime conditions, that no utility operator, so far as Mr. Attwill knew, has been charged with profiteering. Furthermore, the recent adverse operating conditions have undoubtedly developed efficiency in providing service.

As to the solution of electric railway difficulties, Mr. Attwill reviewed several suggestions; for example, reduce fares and carry more people. But, he said, there is no profit in doing a larger business at a loss. As to public ownership and operation, as the bills for providing service must be paid in any case, such a transfer of authority doesn't alter conditions. All that it can do is to distribute the burdens of the cost of service; that is, to transfer a part of them from the car riders to the general taxpayer. To those who advocate receiverships, reorganizations and confiscation, Mr. Atwill replied that it is not honest to take property without due compensation. No, he said, the solution is intelligent co-operation between the public, through its representatives, and the railway managers. It should be recognized that the utility franchise is granted with the understanding that good service at reasonable cost will be given. It is the manager's task to see that this is done, but until the public operates the utilities it is the duty of the state to see that service conditions are fair. Beyond seeing to it that the rates are reasonable, that the service is adequate and safe, that there is no discrimination and that the properties are operated honestly and with reasonable efficiency the state ought not ordinarily to go so long as we have private ownership. To go further is not regulation, as Mr. Attwill said he understood the word, but management, and management of the worst

Members and Guests of New York Electric Railway Association Assembled at Bluff Point, Lake Champlain, for Fortieth Annual Meeting sort because it is management without responsibility. In fact, it usually is nothing more than meddlesome interference.

Until it appears that the utility is obtaining a profit upon its investment in excess of what the public would have to pay to borrow money to maintain the utility if publicly operated, the interests of the utility and the public are in reality identical. The utility desires to earn sufficient income to make its securities attractive and to give good service. The public cannot hope to obtain that service unless the securities are attractive, because no improvements and additions to property can be made unless the securities can be sold.

Moreover, the directors of the utility are under a dual responsibility. They owe it to the public so to conduct the affairs of the utility that it will be able to perform the service in a safe and adequate manner at reasonable rates, and they owe a duty to their stockholders to conduct its affairs in an efficient and honest manner. This requires that dividends not earned ought not to be paid and that the properties should not be sacrificed to bolster the market value of outstanding securities. When these things are done it is proper for the state to step in and control the situation.

Finally, said Mr. Attwill, the 5-cent fare is no more sacred than the price of a 5-cent cigar. Five-cent cigars are not so good as they were before the war, and it is obvious we cannot obtain the same amount of transportation for 5 cents now as was possible then. Five-cent fares are always feasible if the zones are made short enough. But as the bills for supplies of all kinds at prices higher than those of pre-war times must be paid, there is no magic in the various nostrums that have frequently been advocated by certain political gentlemen who are seeking votes.

Railways are subject to and controlled by economic laws, the same as other kinds of business. Credit must be maintained and this necessitates operation at a profit. Mr. Attwill urged faith in the public, from whom money ultimately comes. This is different from faith in politicians and financiers primarily, for their influence and resources in reality come from the public. The public has ample resources and if convinced that utilities are properly managed, that the securities are sound and that the return therefrom is certain it will furnish the needed money.

MR. SIMS SPEAKS ALSO

C. S. Sims, vice-president Delaware & Hudson Railroad, was the final speaker. He gave humorous definitions of the pessimist, as one who sees only the hole in the doughnut, and the optimist, who gets something good out of every situation. Optimism, he said, is needed in the electric railway business now. The competition of the motor bus must be met, and railways may in many cases need to replace rails by bus lines as the former wear out. He paid a tribute to the nearby Montreal Tramways, which, he said, showed a satisfactory solution of the urban transportation problem.

SOCIAL FEATURES AND SPORTS

As usual at these annual gatherings, scratch teams of the railway men and supply men played a fast and vociferous game. A. E. Reynolds and Alex. Cameron were the respective captains. More serious efforts were made on the golf links, under the general direction of H. B. Weatherwax, with creditable scores considering the softness of the grounds. Prizes of silver cups and golf balls rewarded the golfers' efforts. Water sports closed the afternoon program, Harold Hegeman being the leader. The banquet was enlivened with musical numbers by professional singers from New York City and amateur talent, trained and otherwise. A dance followed the banquet.

In the afternoon, also, the ladies enjoyed a bridge tournament on the steamer en route between Bluff Point and Burlington, followed by afternoon tea. During the convention day and on Sunday following, many automobile parties slipped away for short periods for trips to the scenic attractions located near Bluff Point.

The Personal Factor in Electric Railways*

Understanding and a Co-operative Spirit Between Employer and Employee Are Especially Important on an Electric Railway—The Means for Creating This Relation Are Laid Down

By CLINTON E. MORGAN
General Manager Brooklyn City Railroad

TRANSPORTATION is the business of moving persons or commodities between two points in the shortest possible time with safety and comfort. It is the business of an electric railway to provide the facilities and to make the movement at the time most suitable to the purchaser of the transportation. Then it is necessary to sell this service to the public, but before this can be done we must secure the full co-operation of our employees, who are the ones that are constantly in contact with the riding public.

Because of the very nature of the railroad business, with its units scattered, there must be a large number of supervisory officials, with the result that the personal contact between men and management is sometimes not as frequent as it should be for the interest of all.

One of the difficult points of resistance is in the supervisory officials, generally in the ones close to the men. Therefore, it is of the utmost importance, when men are selected for such positions, to see that they are fitted for the task and able to inspire in men under their direction the desire to co-operate with one another and with the management, as well as to enter into the spirit of the work.

We depend on individuals to execute. Any plan which takes the responsibility for the execution of the work away from the individuals charged with intermediate supervision is bound to result in inefficiency. We should endeavor to create respect for management and engender among the employees willingness to have the work of management done by those best fitted to manage, as the management must accept responsibility for carrying on the business. Likewise, management must be mindful of its responsibility in matters of discipline, justice and fair treatment with its employees. The objective in personnel work in any industry is to enlist the maximum co-operation and interest of the human element in the success of the undertaking.

PROBLEMS IMPORTANT ON ELECTRIC ROADS

The problem in public utilities differs in many respects from that in ordinary private industries. Among the utilities themselves it varies. The gas, power and light companies have a more simple problem than the railway, both because of the smaller number of employees involved and because of the class of commodity sold by them. The delivery of the service is made without the purchaser actually coming in contact with the personal representative of the utility, while with a telephone company the purchaser of the service comes in contact indirectly with the employees, such as operators, although not able to visualize the personal representative.

In most other lines of business where large numbers are employed to produce a certain article the public seldom comes in contact with the production force, as the employees are usually grouped under the watchful eye of the supervisory force that is ever ready to assist in promptly straightening out difficulties. But on an electric railway the major portion of the employees not only form the production department but also practically form the entire selling force, and, by the nature of the business and of the units operated, they are placed on their own responsibility more than the employees of any other business.

With the railway, the sale of its service brings the representative, through the conductor, motormen or agents of the company, in direct contact with the public. Thus the public is able to judge the service rendered by the equipment and direct personal representative, and it is through these agencies, coupled with the policy of the management, that the kind of relation existing between the public and the governing bodies is determined.

---

*Abstract of paper presented at the annual meeting of the New York Electric Railway Association, Bluff Point, N. Y., June 24, 1922.

To obtain proper results it is necessary to employ policies that will bring about conditions of mutual confidence and create a spirit of sympathy, understanding and real co-operation between members of its working force, its patrons and the citizens of the communities that are served. Lack of understanding or misunderstanding causes most of our troubles. Therefore, we can only avoid this trouble by properly schooling the working organization so that each individual will know the aims and requirements of each department, functioning with the unit as a whole to produce more and better transportation.

REAL LEADER BRINGS OUT BEST

Many officials assume that their men understand the work to be performed and all the conditions surrounding it without any explanation. Failure to receive proper instruction causes mental uneasiness, particularly to new, inexperienced employees, and this produces fear and distrust, especially if the "boss" criticises the manner in which the task has been performed. Under these conditions, the employees feel they do not receive fair treatment or justice.

Superior results can be expected only under a system which insures square dealing and under a "boss" who honestly practices this method in handling his men, for a real leader should know the art of bringing out the best in the men, creating a spirit of loyalty, pride and ambition, and securing the all-together spirit, so that the organization under him will move as a unit in efficiently accomplishing the job. Indifferent leadership will be quickly reflected in the men, who, on the other hand, will respond in proportionate measure to the earnestness of purpose of the "boss."

It should be borne in mind that the new employee is unfamiliar with our practices and customs. Nor does he comprehend what is wanted of him or his duties to the company and the public. His first contact with the employing officer should be such that will cause him to feel at ease and to believe that he will receive just treatment. He should be personally introduced to the other members of the organization who have to do with his instruction or supervision and while he is being schooled in his duties. The importance of the selection of instructors should be recognized. Many men efficient in their work are not of the type that make the best instructors. Following the schooling period, when the employee is allowed to work without the guiding hand of the instructor, he should be encouraged, and if there is room for just criticism, he should be criticised firmly but fairly, care being taken to point out mistakes of judgment or violation of rules.

The better way of doing it does not always involve infliction of severe discipline. If the problems of instruction are handled properly, every employee will be made to feel that his employment is a great and worthy undertaking, that he is a partner whose individual judgment is valued and his welfare is of the utmost importance to the successful operation of the organization as a whole, for, it must be remembered, our employees are in a sense the servants of the public.

In recent years the introduction into industrial life of many who are strangers to American ways has greatly complicated our problem of serving the public. This condition makes it all the more necessary for the establishment of some definite means to build up mutual confidence and eliminate misunderstandings.

Just now what method or agency should be utilized to cultivate this co-operation may be a question. It is being done not through any personal department or other special organization, but by the officials, including supervisory forces, who are responsible for the management of each department, for these officials, the intermediate bosses, must lift the rank and file to a higher plane of understanding and responsibility.

This is not the task of one whose connection with the organization is vague and temporary. The executive officers must support the supervisory forces in doing that work and must inspire them to do it. The supervisory forces are likely at first to object, because it may appear to them to take away some of their authority or to jeopardize their prestige with their subordinates. However, when they actually understand the subject thoroughly, they are usually convinced that it means more responsibility and more prestige for themselves, which, of course, results in better relationships throughout the organization. This accomplished, proper relations will exist between the utility and the public.

There Should Be Relief From the Paving Tax*

The Tax and Paving Requirements Now Imposed on Street Railways Result in Unfairness and Discrimination

BY ALFRED T. DAVISON

General Counsel Third Avenue Railway System, New York

THE report made this year by the joint legislative committee on taxation and retrenchment of the State of New York, of which Senator Frederick M. Davenport is chairman, shows that the street railways of the state are subjected to tax burdens which are grossly unequal compared with other utilities and corporations generally.

The iniquity of the situation arises from the fact that the agent of the state, namely, the public utility commissions, which have the power to regulate rates and service, thus regulating earnings, act independently of, and have no relation whatever to, the tax burdens imposed by the state under laws created before the establishment of these regulatory bodies. If public utilities are to be used as tax collectors or sources of revenue they should be able to pass on the tax paid to the consumer, and thus the result would be that the consumer is really paying the tax.

The taxation on street railways operating in New York State is as follows:

Taxes levied by the United States: Federal income tax.

Taxes levied directly by the State of New York: Franchise tax on gross earnings. This tax is equivalent to 1 per cent upon its gross earnings from all sources in the state and 3 per cent upon the amount of dividends declared or paid in excess of 4 per cent.

Taxes collected by municipalities under the authority of the state: Special franchise tax, taxes on real estate, paving, the cost of cleaning snow from streets.

Taxes collected by municipalities alone. (These taxes are not collected in all municipalities): car license fees, percentages of gross earnings, fees for uses of bridges.

In New York City street railway companies may not use sweepers unless they agree to clean certain streets from house line to house line.

Imposing as this array of taxes is, the greatest of all the burdens is paving. Before considering this obligation, however, I call attention to four principles which must necessarily govern any system of public utility taxation.

FUNDAMENTALS OF PUBLIC UTILITY TAXATION

1. It is an injustice to ask owners to dedicate their property for the public use, receive no return from it, and then require them to pay taxes taken from their principal and not from their net earnings.

2. Street railways cannot be treated as tax collectors. The very nature of a fixed fare prevents the tax from being passed on to the public, and increased fares result in loss of traffic.

3. Every tax burden placed upon a street railway, other than a tax on its net income over and above a fair return on its property, diverts money which should otherwise be used in giving service to the public.

4. To the extent that taxation deprives capital of a fair return, any taxation other than a tax on net income over and above a fair return prevents street railway corporations from attracting capital for extensions.

The constitutionality of the statutes under which paving obligations have been imposed upon street railways is upheld on the ground that the states in imposing such obligations are exercising the taxing power.

---

*Abstract of paper presented at annual convention of New York Electric Railway Association, Bluff Point, N. Y., June 24, 1922.

HISTORY OF OBLIGATION

The paving obligation is a relic of the days of horse cars, when the horses did cause more or less wear and tear of the pavement and when the pavement was very simple, and it was not such an obligation as now exists, with the improved types of pavements involving the enormous expenditures. The paving obligation has survived the conditions which gave rise to it and now diverts the earnings of the company to uses which are entirely unconnected with service.

Every dollar from earnings which the street railway company is required to pay for paving means there is just so much less which the Public Service Commission can order expended for service or improvements.

The specific relief which we now ask is that the gross injustice now suffered by street surface railroads by reason of the paving obligation, under Section 178 of the railroad law, be removed, and that there be substituted therefor a paving requirement based upon fair and equitable principles, which will have reference to engineering features, and not constitute contributions by way of taxes.

UNFAIRNESS OF PRESENT PAVING OBLIGATION

The standard gage of car tracks in New York is 4 ft. 8½ in. and in double-track operation the width of the space between the tracks is usually 5 ft. Adding to this the 2 ft. in width outside of the tracks, as provided by the law, in each street where there is double track the street railways have to pave and keep in repair from 18 to 19 ft. of the roadway. This is from one-third to two-thirds the entire paving on those streets. The practical result is that in the streets where street railroads operate, new and more costly types of pavement are constantly being substituted for pavement which is still in good condition, because the companies must finance a large part of the cost of such improvement. Also, as a large general taxpayer, the company must bear its proportion of the cost of all other paving.

From 1911 to 1920 the street railways of New York State each year expended for paving alone an average of 23.4 per cent of their net income, or, to put it in another way, the paving expense has amounted to approximately 5 per cent of the total operating expenses of the companies during that time.

During these years in the metropolitan area, for every 100 cents expended for track and roadway purposes, other than paving, from 40 to 80 cents additional was expended for paving.

The percentage which the area maintained by the railways bears to the total paved area in those streets in New York City is 35 per cent; in Utica, 38.6 per cent; in Syracuse, 46 per cent; in Rochester, 56 per cent.

The great increase in number of motor vehicles has resulted in less riding on street cars. At the same time these motor vehicles have greatly increased the wear and tear upon the pavement in the streets upon which they operate. From 40 per cent to over 90 per cent of the total vehicular traffic in the streets operate over the railway area, so that the railway company is not only paying for the pavement so worn out by vehicles but for a larger proportion of this damage than is borne by the municipalities.

WHAT IS THE REMEDY?

In seven states, namely, Pennsylvania, Maryland, Georgia, Arkansas, Indiana, Oregon and Washington, there are no general statutes covering the subject of paving. In other states, such as New Jersey, Virginia, Kentucky, Texas, Ohio, Illinois, Michigan, Minnesota and Wisconsin, the municipal authorities have the right to determine or impose the paving obligation.

In view of the decision of the United States Supreme Court to which attention will later be called, it is unimportant to determine whether the municipal authorities in imposing such obligations do so by way of taxation or by way of contractual obligations imposed in the franchises themselves.

In Massachusetts, Connecticut and California drastic obligations similar in form to those now in force in New York have been modified.

While the street railways should be entirely relieved from this obligation, in view of the fact that the city authorities have claimed that the operation of electric cars on the streets does cause some deterioration of the pavement, it was argued before the Legislature of the State of New York at the last session that the most which the companies should be required to do is that required by the State of Connecticut, namely:

> • • • the cost of restoring to its former condition so much of the highway included within a distance of 8 in. on each side of each rail as shall have become in need of repair in consequence of the existence and use of such tracks. No such company shall be compelled to pave or repave or to pay the cost of paving or repaving any portion of the highway in which its tracks are laid, except as provided herein.

The relief then suggested was two-fold, viz.:

1. Eliminate any obligation on street railways to do any original paving. The only reason ever advanced why street railways should do any paving being that the operation of their cars caused deterioration of the pavement and as they cannot cause the deterioration to a pavement which has not yet been laid, the railway company should only be required to maintain a certain part of the pavement after it has been laid.

2. Reduce the obligation to repair to the wear and tear or damage done in consequence of the existence and use of the tracks over a maximum area of 8 in. on each side of each tram rail.

A bill was introduced at the 1922 session of the Legislature of New York whereby the railroad law would have been amended along these lines. The cities which so greatly benefit under the present law objected, but their objection was shown to be without merit, because under the proposed form of relief the railways would still be required to pay directly for the actual damage they do, and that is more than is required from any other user of the street.

FRANCHISE OBLIGATION REMOVABLE

The question has been raised a number of times whether street railways can be relieved from the paving obligations when embodied in the franchises themselves. There are two decisions in the United States Supreme Court which, in my opinion, squarely uphold the authority of the state to alter paving obligations, even when contained in franchises. One of these is Worcester vs. Street Railway Company, 196 U. S., 539, and the rule of this case has been applied frequently in later decisions by the Supreme Court, noticeably in City of Pawhuska vs. Pawhuska Oil & Gas Company, 250 U. S., 394. The second decision to which I refer is City of Chicago vs. Chicago Railway Company, and decided in November, 1921. These show there is no legal obstacle in the way of obtaining relief.

No relief was granted at the last session of the New York Legislature. A committee has been appointed by this association and will endeavor to confer with a committee appointed by the Mayor's conference to see if they can agree upon some recommendation for the much-needed relief. The righteousness of our cause should inspire us to leave no effort untried which will possibly aid in the accomplishment of this relief.

Affiliation of Boston Engineering Societies

NINE engineering societies with a total non-duplicating membership of about 3,500 have completed organization as the Affiliated Technical Societies of Boston and have established headquarters at 715 Tremont Temple, on the premises formerly occupied by the Boston Society of Civil Engineers and the New England Waterworks Association. The affiliation received a charter from the State of Massachusetts on June 12 and is the outgrowth of various informal meetings during the past year. The participating organizations are the Boston Society of Civil Engineers, which is the oldest engineering organization in America; Boston sections of the American Institute of Electrical Engineers, American Society of Mechanical Engineers and American Institute of Mining and Metallurgical Engineers, New England Waterworks Association, Plant Engineers' Club, Northeastern Section American Society of Civil Engineers, Massachusetts Chapter American Society of Heating and Ventilating Engineers and Boston Chapter American Association of Engineers.

Record Attendance at A.R.A.

THE final figures for the registration at the American Railway Association convention, recently held at Atlantic City, show an attendance larger than ever before. There were fewer supply men and ladies at the meetings this year, but this decrease was more than offset by the increase in the number of railroad men and their families who registered. There were 2,339 railroad men registered this year, as against 2,024 in 1920. The total registration for the two years was 6,254 for 1922 and 6,073 for 1920. The total registration at the American Electric Railway Association convention in 1920 was 3,330.

American Association News

Advertising Section Has Made Good

GRATIFYING results have been obtained by the Advertising Section of the American Electric Railway Association, according to a preliminary report just made to Guy E. Tripp, chairman of the Committee of One Hundred, by Henry R. Hayes, secretary-treasurer of the committee.

The Section began to function on Jan. 1, 1921, with Labert St. Clair, who had charge of the publicity work for the Federal Electric Railways Commission, as director, working under the immediate supervision of the association committee on publicity and Mr. Hayes.

Funds for carrying on the work first were advanced by the association and later raised by voluntary subscription. Mr. Hayes reports that generous support has been forthcoming from electric railway companies and manufacturers, both members and non-members of the association, but that the books are still open to subscription.

Although the work of the committee is carried on from association headquarters, no discrimination is shown between member and non-member companies. The movement is for the general good of the industry.

"The efforts of the advertising section have been highly successful," Mr. Hayes says in his preliminary report. "It has obtained a large amount of constructive publicity in the daily newspapers and periodicals for the electric railway industry; has prepared and distributed a large amount of printed advertising material dealing with electric railway situations of national interest; and rendered personal services in special cases to many individual companies. Service is given to all electric railway companies by the advertising section regardless of whether they are members of the association or not.

"The committee on publicity of the association reports monthly on the joint activities of itself and the advertising section to the executive committee of the association, and I am in constant touch with the character of the work that is being done."

Probably the most constructive work done by the section has been that of giving electric railway news a real standing in the papers and periodicals of the country. The policy of the section, as laid down by the committee on publicity and indorsed by the Committee of One Hundred, has been that of absolute truth in all dealings with the press. No attempt has been made to "put over" stories without news merit and the result is that today electric railway news is received at the source of national and local news channels with the same credit as other news from unquestioned sources.

An effective country-wide organization for the dissemination of electric railway advertising material also has been built up outside the section's newspaper and periodical connections. The section has a correspondent on every electric railway property and in every manufacturing plant producing electric railway materials and supplies in the United States and its possessions and in Canada. It also co-operates with directors of state public utility information committees in thirty states. An advisory committee of eight working publicity men meet regularly with the director and make recommendations to the general committee on publicity.

Membership Committee

A MEETING of this committee was held on board the S. S. South American on June 28 in connection with the cruise of the Central Electric Railway Association. Those present were: Chairman F. R. Coates, W. S. Rodger, F. G. Buffe, M. B. Lambert, H. J. Kenfield and L. E. Gould, with R. R. Holden representing the exhibits committee, C. W. Kelly, director of exhibits and Secretary J. W. Welsh. Various suggestions were considered and definite plans laid for pursuing more actively the work of securing new railway and manufacturer members. Co-operation with the exhibits committee will be followed closely in getting the non-member manufacturers into the association so they may take advantage of the much improved conditions in the industry exhibit.

Committee on Highway Construction and Maintenance

LAST month President Todd appointed a committee to make a report at the Chicago convention. The subject assigned to it for study is the cost of construction and maintenance of highways. There are nine members consisting of a chairman, four other executives, and four way engineers. The personnel of the committee is as follows: W. J. Harvie, Auburn, N. Y., chairman; W. H. Sawyer, East St. Louis, Ill.; S. W. Greenland, Fort Wayne, Ind.; J. H. Hanna, Washington, D. C.; C. M. Cheney, Des Moines, Ia.; W. F. Graves, Montreal, Que.; E. P. Roundey, Utica, N. Y.; H. M. Steward, Boston, Mass., and E. C. Johnson, Los Angeles, Cal.

The committee held a preliminary meeting on June 22 at the New York headquarters. Its purpose, as outlined by the chairman, is to secure statistics along the lines of the title of the committee, such as the mileage of state highways improved by years for the last five years, construction costs, maintenance costs, origin of funds by which these costs were defrayed and other pertinent information. This information will be secured from railway companies which are in a position easily to obtain it, and the committee hopes that its request for assistance will receive consideration. An extended report can hardly be prepared in time for the October convention, but the committee hopes that some facts at least can be presented.

Mail Pay Case Reopened

THE Interstate Commerce Commission has reopened the case involving electric railway mail pay. A petition to the commission for the reopening of this case was made by the American Electric Railway Association, which asked the commission to re-examine the facts and circumstances surrounding the transportation of mail matter on electric railways and the service performed by them in connection therewith so as to fix fair and reasonable rates in compensation therefor. After a study of this petition and of the answer to it of the Postmaster-General, the commission has decided to reopen the case.

Exhibits Committee

THE second general meeting of the convention exhibits committee was held in the office of Chairman E. J. Blair, Chicago, on June 24. An unusual demand for space was reported, due principally to the number of new exhibitors applying for exhibit privileges. The actual amount of space applied for during the first three weeks was approximately 50 per cent greater than for the corresponding period at the last exhibit. At present there is a greater amount of space available on account of the great size of the pier. It is the plan of the committee, however, definitely to assign the space applied for at its next meeting on Aug. 1, filling up the sections as assignments are made. This will make difficult an expansion of the space of any exhibitor, thereafter, and so the committee is urging all applicants to arrange adequately for their requirements in advance of the next committee meeting. The following sub-committees were appointed: Heavy outdoor exhibits: H. H. Adams, Walter Cummings; electricity and air, C. H. Jones, R. R. Holden; restaurants, J. C. McQuiston, R. B. Fisher; meeting rooms and decorations, L. E. Gould, W. J. Walsh, L. W. Shugg.

Recent Happenings in Great Britain

South Eastern Railway Electrification—Underground Railways Development—Manufacturing Profits

(From Our British News Representative)

THE outstanding matter in the electric traction field in this country is the preparation which is being made for the conversion to electric traction of the suburban lines of the South Eastern & Chatham Railway.

The South Eastern Scheme

On June 2 a special meeting of the South Eastern Railway agreed to an application being made, in concert with the London, Chatham & Dover Railway, to the Ministry of Transport for an order to authorize the companies to construct electric generating stations, to enter into an agreement with a construction company for the construction of a generating station at Charlton, on the banks of the Thames estuary, and for the construction, supply to and use by the two railway companies of electrical works, rolling stock, plant and equipment for working the traffic on the companies' suburban railways by electrical power. This is the scheme to which reference has been made previously and it involves a route mileage of 94, or 210 miles of single track. A government guarantee on £6,500,000, principal interest, under the trade facilities act has been obtained. The construction company will electrify the lines and there will be a lease by it to the two railway companies of the electrical works. The cost of the work will be raised by redeemable debentures or loans and on redemption the works will become the property of the railway companies. It is proposed that the three-wire system of electric distribution shall be adopted. That system has never been used on any British electric railway before except on the City & South London Railway.

Plans Made to Start Work

At the meeting on June 2 Cosmo Bonsor, the chairman, gave further details of the financial arrangements, which are probably unique. He said that there was to be no public issue, no commission paid, no underwriting, no assistance from any intermediary. They had formed a private construction company; it had been registered and subscribed. They were thus at once ready for work. The construction company created what was known as a debenture, not paid up. It was lodged at the Bank of England, with a Treasury mandate attached, on which the money would be borrowed as required for the construction of the works. The government security would be for £6,500,000 and on the security they would borrow for a period of twenty-five years. The Bank of England, holding the security, had agreed to lend the money as required at a rate of interest not exceeding bank rate. The works were to be completed in three years. They might also during construction go to the money market and borrow on short loans. The scheme would directly employ 4,000 men.

At a hearing in the end of May and early in June by the Electricity Commissioners in an application by the South Eastern & Chatham Railways managing committee for the Commissioners' consent to the construction of the necessary generating station some additional points of importance were brought out. The £6,500,000 guarantee is for the first stage only of the total scheme of the companies. The construction company consists of five members of the managing committee and two of their officers. It will have a capital of only about £10,000 and will carry out the work with the £6,500,000 raised under the guarantee mentioned. The cost of the generating station is estimated at £1,130,000. The maximum demand anticipated for this first stage is 29,000 kw. and the output 90,000,000 units per annum. The estimated cost of production is put at about ½d. per unit. The frequency proposed is 25 cycles per second, that being the frequency already in use by the London & South Western and the Brighton Railways.

Underground Improvements Imminent

The London underground railway companies, having got their government guarantee under the trade facilities act for their proposed extensions and improvements (particulars of which have been previously given) have issued a statement showing that £1,000,000 is to be raised by second debenture stock of the London Electric Railway and £1,500,000 by second debenture stock of the City & South London Railway, for which the companies already have powers, and such further amounts as may be authorized by Parliament up to a maximum of £6,000,000. The stocks are to be issued as redeemable debentures at rates of interest not exceeding 5 per cent per annum. Repayment is to be by 1972, with the option to the companies to redeem after 1942. The stocks will be a charge on the common fund of the associated companies, out of which the prior charges of all the companies are paid. The government's contingent liability in present circumstances is practically negligible. The companies are making application to Parliament for the necessary increase in borrowing powers and for authority to pay interest out of capital during the construction period. A number of contracts for the new works have now been let, and there will be no avoidable delay in beginning operations. Work will be provided for about 20,000 men, including men engaged on the manufacture of materials.

City Purchases Glasgow Subway

Glasgow Town Council on May 25 decided by a majority of votes to agree to the purchase of the Glasgow District Subway at a price of £385,000. The directors of the subway company have agreed to the figure, though it means only 10s. per £10 share in the company. As was explained on a previous occasion, the subway is a circular route underground cable railway which has been in financial difficulties for a long time. These difficulties were of course largely due to the competition of the municipal electric tramways. Now the subway should pay, seeing that there will only be a nominal capital liability on it. The fate of the shareholders in the underground road is the dismal aspect of the case.

People who are inclined to think that the tramways will be superseded may profitably direct their attention to some recent remarks by a leading British tramway expert. J. B. Hamilton, general manager of Leeds City Tramways and chairman of the Bath Tramways, recently returned from a tour around the world. Speaking at a meeting of the Bath company early in May, he said that those who had invested their money in tramways in Britain need have no fear that such undertakings would be superseded by other forms of traction. In all cities of the world where the electric tramcar was practically doing the work of transportation it was, in his view, likely to continue to do so.

Presiding at the annual meeting in London on May 16 of the English Electric Company, Sir Charles Ellis said that in recommending a dividend of 5 per cent on the ordinary shares the directors considered that they had reconciled the natural expectations of the shareholders with the needs of a difficult and obscure period to come. The state of things abroad was unprecedented; many foreign markets were closed; others still languished. Owing to a serious industrial dispute the engineering industry had this year to face peculiar difficulties. He was of the opinion that the best way out of present difficulties in general would be found through the efforts of private enterprise.

With the help and assistance of five powerful associations of world-wide reputation this company had recently formed the Power & Traction Finance Company, with the object of dealing with comprehensive engineering contracts on a large scale. During the last year the English Electric Company had secured many important contracts, including railway electrification contracts in Spain and Japan.

PERSONAL MENTION

Commission Approves Grant

New Franchise of Grand Rapids Railway Will Go Before Voters—Sliding Fare Scale

Many months of negotiation have resulted in the approval by the City Commission of Grand Rapids, Mich., on June 12 of the franchise ordinance giving the Grand Rapids Railway a new franchise grant to conduct a street railway business in the city of Grand Rapids for a period of thirty years. On June 13 the franchise provisions were accepted by the Grand Rapids Railway. It remains now for the electors of the city to approve the grant. Just as soon as they do this the franchise will become effective. It seems likely that the proposed franchise will be put up to the voters as planned at the primary election on Sept. 12. The company has been operating without a franchise for many months. Various developments in the negotiations have been noted in the *Electric Railway Journal* since January of this year.

Under the new grant the company will be permitted to charge a 10-cent fare with seven tickets for 50 cents at least for three months from the adoption of this franchise. At the expiration of this period the rate of fare will be increased or decreased in fixed steps according to the following schedule:

5 cents cash and thirteen tickets for 50 cents.
5 cents cash and seven tickets for 25 cents.
5 cents cash and six tickets for 25 cents.
5 cents cash and eleven tickets for 50 cents.
5 cents cash.
10 cents cash and five tickets for 25 cents.
10 cents cash and nine tickets for 50 cents.
10 cents cash and four tickets for 25 cents.
10 cents cash and seven tickets for 50 cents.

An "Automatic Fare Equalization Account" is provided for determining the fare basis. This section provides in part:

> Whenever there shall be a net debit of more than $50,000 to the equalization account then the next higher rate of fare and the next lower rate of return shall be and become effective; whenever there shall be a net debit exceeding $100,000 to the equalization account then the next higher rate of fare and the next lower rate of return shall be and become effective and the rate of fare shall be further increased from time to time in like steps until the debit to the said equalization account is wiped out. Whenever the net credit to the equalization account exceeds $50,000 the next lower rate of fare shall be and become effective; whenever the net credit exceeds $100,000 the next lower rate of fare shall be and become effective and all amounts to the credit of the equalization account in excess of $100,000 shall be used as a basis for further reductions in fare and in like steps.

The value of the property is fixed at $5,500,000 as of Jan. 1, 1922, with the city or the grantee having the privilege after the first five years of requesting a re-valuation at any time. The initial rate of return is to be 8 per cent. The return is, however, to be decreased ¼ of 1 per cent whenever the rate of fare is increased one step. Thus when the cash or ticket fare in effect is less than 5 cents the return to the company is to be increased ¼ of 1 per cent for each step that the fare is reduced.

The grant also provides for a depreciation fund to which is to be credited monthly an amount sufficient to offset depreciation. The amount so credited to the depreciation account, until changed by mutual agreement or by arbitration, has been placed at the rate of 3 per cent per annum on the then value of all the grantee's property less the salvage received. At no time can the balance in the depreciation account including interest, etc., be more than 15 per cent.

The franchise does not permit the Grand Rapids Railway to sell or sublet to another unless such step is approved by the City Commission. All financing must be subject to the approval of the Public Utilities Commission.

Several sections included in the franchise draft before it was complete and given in the *Electric Railway Journal* of May 6 remain the same. They include provisions on extensions, reports to be submitted, right of city to buy property, etc.

Lynchburg Wages Reduced

According to a new wage bulletin dated May 17, 1922, wages of conductors and motormen of the Lynchburg Traction & Light Company, Lynchburg, Va., were reduced 5 cents an hour, 1 cent each two weeks extending over a period from June 1 to Aug. 1. This scale in cents per hour is as follows:

Year's Service	June 1 to June 15, 1922	June 16 to June 30, 1922	July 1 to July 15, 1922	July 16 to July 31, 1922	August 1, 1922 and Thereafter
First	38	37	36	35	34
Second	41	40	39	38	37
Third	42	41	40	39	38
Fourth	43	42	41	40	39
Fifth and thereafter	44	43	42	41	40

On Nov. 1, 1921 a wage scale became effective ranging from 39 cents to 45 cents an hour which was a reduction of 5 cents an hour from the schedule in effect to Nov. 1, 1921. With the present sliding scale reduction this makes two 5-cent reductions since October, 1921. The Nov. 1 scale for motormen and conductors in cents per hour was:

For the first year's service	39
For the second year's service	42
For the third year's service	43
For the fourth year's service	44
For the fifth year's service and thereafter	45

Report Submitted

Outlines Hollywood Improvements to City Council and Progress of Pacific Electric Railway

In addition to the proposed extensive program of the Pacific Electric Railway to expend $2,500,000 in constructing a subway 1 mile long out of its present Hill Street Terminal and the purchase of fifty new cars to improve the Hollywood street car service, as ordered by the California State Railroad Commission, Chief Engineer H. Z. Osborne, Jr., of the Los Angeles Board of Public Utilities has presented a report to the City Council outlining the progress the Pacific Electric is making with its improvements. The first of the new cars will arrive July 10 and the application for the subway franchise is in the hands of the city for adoption. The railway company has purchased a portion of the new right-of-way required for the subway.

BUS SERVICE RECOMMENDED

In Mr. Osborne's report to the City Council he outlined his plan for improving the Hollywood street car service, which included a change of the present 6-cent fare zone on the Pacific Electric Railway, the construction of a belt line about the business district of Hollywood, double-tracking and extensions of the Los Angeles Railway lines, the operation of a municipal bus line service in certain sections on Vermont Avenue, and bus line service in certain sections of Hollywood by the Pacific Electric.

The report states that the Pacific Electric has purchased the fifty new street cars for special Hollywood service and that the site for the west entrance of the proposed Pacific Electric subway under Bunker Hill has been obtained by the company. The utilities board's report states that it indorses a change of the 6-cent fare limit zone for the Hollywood district, now fixed for Sanborn Junction. It recommends that the zone limit be extended to Hollywood Boulevard and Vermont Avenue for the Hollywood Boulevard line, and Santa Monica Boulevard and Western Avenue for the Santa Monica Boulevard line.

BELT LINE PROBABLE

Additional improvements which the utilities board recommended were the operation of a belt line in the Hollywood district to serve local Hollywood needs and adequate transportation to provide crosstown service, such service to be provided by motor buses in the event that the extension of the Los Angeles Railway line is impossible at this time.

Des Moines Grant Invalid

Lower Court Rules Against New Franchise Awarded Last Fall—Decision to Be Appealed

Judge James C. Hume of the Polk County District Court has made a decision in the Des Moines City Railway franchise case in which he declared invalid the franchise recently secured by an overwhelming vote.

Judge Hume's ruling is on the suit brought by Grant Van Horn representing the North Des Moines Improvement League.

In brief he holds in his decision that the franchise is invalid because:

> It is an exclusive franchise.
>
> It was not properly advertised.
>
> It permits the company to charge a rate of fare in excess of that justified as a fair return upon the reasonable value of the property.
>
> The city of Des Moines was without power to repeal the existing 5-cent fare.
>
> The people have a vested interest in the then existing 5-cent fare franchise.
>
> The adoption of the franchise was outside the scope of the city's authority.

F. C. Chambers, general manager of the Des Moines City Railway, announced that his company would appeal the case to the State Supreme Court and until that decision was rendered would continue the 8-cent fare.

Former Corporation Counsel H. W. Byers, who conducted the case for the North Des Moines Improvement League, claimed that in view of Judge Hume's decision the railway, if it collected 8-cent fares, must give a receipt so that the rider may be protected for a refund of 3 cents.

A suit to restrain the city from holding the election was brought on Nov. 18, 1921. Judge Hume granted a temporary injunction restraining the holding of the election. The case was then taken to the State Supreme Court and an order was made by Justice Stevens permitting the election to be held and remanding the case back to the district court for trial.

The case was opened in the district court on May 29 and closed on June 9.

Further reasons than those mentioned above for rendering the decision are named by Judge Hume. He claims that the franchise ordinance contains more than one subject and subjects not clearly set out in the title. Further that the City Council passed the franchise ordinance without the proper legal publication.

In his decision Judge Hume criticised the tactics employed in conducting the pre-election campaign. The campaign was conducted by leading business men of the city and was in charge of Alexander Fitzhugh, a former president of the Des Moines Chamber of Commerce and now secretary-director of the Greater Des Moines committee. Mr. Fitzhugh's integrity has always been beyond reproach in Des Moines and he has been considered one of the most influential business men in Des Moines.

The outcome of the election held on Nov. 28 was a popular one and the vote was overwhelmingly for the new franchise. Since the franchise was granted the Des Moines City Railway has spent large sums of money in rebuilding and general satisfaction has been expressed over the improved service now being furnished.

The city of Des Moines will be a party to the appeal to the Supreme Court. This is a foregone conclusion. Some interesting developments in the Des Moines case may be expected during the next few months.

As a matter of fact the city of Des Moines has been injured by the damaging advertising its railway tangle has received in the past five years. It will be up to the higher courts to pass conclusively on the ruling made by Judge Hume, but to the great bulk of the citizens there is no satisfaction in the ruling just rendered.

Wage Agreement Renewed in Brooklyn

Announcement was made on June 28 that the present wage scale for employees of the Brooklyn (N. Y.) Rapid Transit System now in service in the respective groups of employees included in the Employees' Representation Plan would be continued for another year, until Aug. 3, 1923.

The Brooklyn City Railroad, through H. Hobart Porter, its vice-president, also announced that similar action had been taken in respect to the wage scale for its employees.

The decision to continue the present wage scale for these groups of employees for another year was based on the recommendation of the committees of employees' representatives elected under the Employees' Representation Plan. The recommendation of the Employees' Representatives was concurred in by representatives of the management. Their recommendation was based on a thorough investigation into the changes in living cost during the past year, which was made jointly by representatives of the employees and the management and extended over a period of five weeks.

Wage Matter to Be Settled by Arbitration

The dispute between the employees and the management of the Michigan United Railways over the wage reduction proposed by the company will be settled by an arbitration board. The wage agreement between the company and the union expired on May 31. Meanwhile the men are understood to be working at a reduction of 2 cents an hour under the old scale, pending the result of the arbitration award. John F. Collins, vice-president and general manager of the company, said:

> We are not getting in enough money to care for our cost of operation. We have cut expenses, at every possible corner, to the point where safety prevents further cuts. There remain only the wages for readjustment. The employees and the public are the only ones who benefit now from the operation of the road. Those who put their good money into the property are getting nothing in return and are standing by while the road goes further and further in the hole.

Subway Plan Outlined

Chicago Again Takes Steps Toward Consummation of Plan for Unification of Transit Lines

Means by which Chicago may take over surface and elevated lines and proceed with the construction of a subway system were outlined in a report and opinion, accompanied by the draft of a proposed ordinance, submitted to the local transportation committee of the City Council on June 26. It was expected that action by the City Council would be deferred until fall and a popular referendum held then.

Issuance of public utility certificates under authority of the municipal ownership act is the principal recommendation. The ordinance provides the city may not undertake operation or lease the properties until the proposition shall have been submitted to the electors. In their report the lawyers for the committee assert municipal ownership is "imperative and desireable" and point to the impossibility of financing extensions of present lines. Reference is made to the Parsons-Arnold-Ridgway report of 1916 that an initial construction program to double present facilities would cost at least $86,000,000, and that a completed plan would cost minimum of $275,000,000. The report continues:

> Obviously no such sums of money could be raised by the existing surface lines, dependent as they are upon short-term franchises, nor could they raise any such sums even if the laws of the state were so altered as to permit the granting of longer or indeterminate franchises. Further, we believe it has been demonstrated that the people of Chicago are not in favor of granting such longer or indeterminate franchises to privately-owned companies.

It is expected that Mayor Thompson will veto the proposed ordinance even if it passes the Council because he has a plan of his own which he believes will be revived when the next Legislature meets.

Plans to Extend Lines

E. A. Devereux, superintendent of the Fresno (Cal.) Traction Company, has announced that his company has ordered material for track extensions of the Fresno Avenue Line and the Tulare Avenue Line into Arlington Heights approximating $9,000. Delivery on the orders is expected in sixty to ninety days. The requisitions by the Fresno office call for rails, ties, overhead materials and special work. The greater part of the rails order comes from Pittsburgh, ties from northern California and the overhead materials from Eastern points. The Fresno Avenue extension is definitely settled, running north half a mile to Olive Avenue. But in the Arlington Heights district the traction company is awaiting an expression of opinion from the residents as to where the car line is most desired. The Arlington Heights line will be "tied in" with either the Tulare Street present line or the Fresno Avenue line. Total cost of the two extensions will be $107,000, it is stated.

Steam Line Electrification as Part of Interurban Project

Instead of building its own line between Dallas and Denton, 37 miles, the Texas Interurban Railway has entered into a contract with the Missouri, Kansas & Texas for the electrification and use of the latter's track between the two places. Under the terms of the franchise which the City Commission of Dallas granted the C. W. Hobson electrical interests in 1917 it is required that two interurban lines, each to be not less than 30 miles in length, be built out of Dallas within five years after the granting of the franchise.

The Texas Interurban Railway was organized to build the new lines. Its first one is to run to Terrell and this has been under construction for several months. It will be finished about Jan. 1, it is stated. The contract between the Texas Interurban Railway and the Missouri, Kansas & Texas for converting the Dallas-Denton line into electric trolley traction has been submitted for approval to the Federal District Court in St. Louis, in which the receivership of the Missouri, Kansas & Texas is vested.

It is stated that plans are all ready for the erection of the poles, the stringing of the trolley wires and the connecting up with the power transmission systems of the Texas Light & Power Company, subsidiary concern. The equipment will be of special design and will be built to order. The use of the track for interurban purposes will not interfere with the Missouri, Kansas & Texas through freight and passenger train service.

Wants Cities to Regulate Public Utilities and Control

The League of Texas Municipalities will stand sponsor for and seek enactment in Texas of a public utilities act, which shall provide machinery under which the cities can regulate and control public utilities. Action looking to the enactment of such legislation was taken by the league at its recent meeting in Waxahachie in the adoption of a resolution providing for the appointment of a committee of nine to make a study of utility legislation, to frame a bill meeting the needs of Texas municipalities and to work to secure the passage of such a bill through the Texas Legislature. The newly-elected president, Mayor E. R. Cockrell of Fort Worth, was empowered to appoint the committee called for by the resolution, and he announced his appointments.

It is announced that this committee will study the public utilities bill before the last regular session of the Texas Legislature and will try to determine just why that measure was defeated. A study will also be made of the decision of the United States Supreme Court in the Galveston street fare case, and a bill will be drafted that will be placed before the Legislature when it convenes next January.

At the concluding session of the league, Bryan was selected for the next meeting place and the following officers were elected: Mayor E. R. Cockrell, Fort Worth, president; C. H. Fulwiler, Mayor of Breckenridge, first vice-president; E. E. McAdams, city manager of Bryan, second vice-president; O. B. Black, Mayor of San Antonio, third vice-president.

Glendale Seeks New Railroad

Property owners of Glendale, Cal., have started negotiations with the Union Pacific System for a new electric line into Glendale, which would make use of the old Los Angeles & Salt Lake Railroad (Union Pacific System) tracks, now practically unused in the city of Glendale. It is understood that the Union Pacific asks the city to contribute a bonus of $25,000 from property owners who desire the line and proposes to ask certain other concessions from the city itself such as the acquisition of lumber yard property on Glendale Avenue for use as a terminus.

The new railroad if extended into Glendale would open up the eastern section of the city, the Montrose district and the Selvas de Verdugo territory by giving it additional trolley service, as this section of the city is at present partly served by the electric line of the Glendale & Montrose Railway. Glendale at present is served by the Pacific Electric Railway's interurban line between Glendale and Los Angeles, also the Pacific Electric operates local feeder bus lines in Glendale.

If the Union Pacific takes this step to serve Glendale the city does not know whether or not it would require the granting of a new franchise to the railroad. The Los Angeles & Salt Lake Line (now owned and operated by the Union Pacific) has a single track line entering East Glendale and to use it as an electric line would require the laying of an additional track.

Plans New Safety Campaign

The Kansas City Division, National Safety Council, has been reorganized and an aggressive program has been announced by the new officers. The program stresses traffic safety, but education is mentioned as a foundation element in the attainment of safe conditions. The first object aimed at is the regulation of motor traffic, the enforcement of rules under present ordinances and the enactment of new ordinances to check the reckless motorist.

The division has been reorganized by representatives from about thirty civic bodies, including the Chamber of Commerce and the Automobile Club, Mayor Cromwell being president of the Automobile Club and extending its co-operation. Julien H. Harvey continues as secretary of the division. Mr. Harvey, it will be remembered, had charge of the program for safety initiated by the Kansas City Railways several years ago, when important educational work was done by the railway through the public schools.

News Notes

Renews Franchise.—The Manhattan Bridge 3-Cent Line, New York, N. Y., has obtained a fifteen-year extension of its franchise. Under the renewal terms the company will pay the city 5 per cent of its gross annual earnings, but not less than $7,000 a year. The original franchise was granted in 1912.

New Agreement Ratified.—Members of Boston car men's union have accepted and ratified changes in the working agreement recently entered into by the trustees of the Boston Elevated Railway and the local wage committee. Some weeks ago the men accepted a new wage schedule which was given in the *Electric Railway Journal*, issue of May 20.

Will Try to Operate Line.—A short-term lease to operate the abandoned line between Millville and Bridgeton, N. J., has been obtained by Clayton McPherson. The Bridgeton - Millville Traction Company suspended operation on June 15 owing to jitney competition. The Board of Public Utility Commissioners has authorized the short-term lease.

Wages Reduced.—The wages of section men of the Arkansas Valley Interurban Railway were recently reduced from 35 to 30 cents an hour by the Kansas Court of Industrial Relations. The Arkansas Valley Interurban has its head office in Wichita, Kan. In giving this order the court made a decision applicable to all industries, that a shortage or surplus of labor is not a determining factor of whether employees can appeal to the industrial court to settle a wage dispute.

Franchise Being Sought.—Interests which the City Commission will not disclose are seeking a twenty-five-year franchise for the operation of street cars at Lima, Ohio. According to C. A. Bingham, city manager, the franchise is sought preliminary to the unnamed company taking over the street railway lines now owned by the Ohio Electric Railway. It is understood the negotiating company is close to the holders of the bonds of the Ohio Electric.

New Wage Agreement Being Negotiated.—Officials of the Interborough Rapid Transit Company, New York, N. Y., and the Interborough Brotherhood conferred on June 26 regarding an extension of the wage agreement which expires on July 1. The present agreement was first made last July when the men voluntarily accepted a 10 per cent reduction in pay in order to aid in keeping the system out of receivership. That agreement ran out the first of this year and was then renewed for six months. The 10 per cent cut last summer saved the company $7,000 a day, or about $2,600,000 a year.

Financial and Corporate

Financing Plan Announced

Arrangement Approved Under Which Eastern Pennsylvania Railways Will Be Reorganized

Of the 8,528 shares of preferred stock of the Eastern Pennsylvania Railways Company outstanding and held by the public, more than 7,200 shares, or over 84 per cent, have been deposited with the depositary under the reorganization agreement; and of the 39,174 shares of common stock outstanding in the hands of the public, more than 34,800 shares, or over 88 per cent, have been deposited.

EAST PENN ELECTRIC COMPANY

The stockholders' protective committee has formulated a reorganization plan calling for the organization of a new corporation under the laws of the State of Pennsylvania, under the name East Penn Electric Company, which will construct, own and operate a modern 25,000 kw. generating station, primarily to supply electricity to the Eastern Pennsylvania Railways. The new company, which, according to the plan, is also to take over the assenting stock of the Eastern Pennsylvania Railways, will have an authorized capital of 50,000 shares of no par value first preferred $7 per annum stock, 10,000 shares of no par value second preferred $8 per annum stock, and 150,000 shares of no par value common stock.

The new company, after the plan is declared operative, will issue the following securities:

Bonds:	
First mortgage 6%, 30-year gold bonds (first series)....	$2,500,000
Stocks:	
First preferred stock, no par value, cumulative dividends $7 per share per annum	12,000 shares
Second preferred stock, no par value, cumulative dividends $8 per share per annum	9,382 shares
Common stock, no par value (about)	100,347 shares

The $2,500,000 first mortgage bonds and the 12,000 shares of first preferred stock, together with approximately 22,000 shares of common stock, will be sold to provide funds for the erection of the new power plant. This purchase has already been underwritten and will provide more than $3,000,000 of new money for the purpose indicated.

DIVIDEND ARREARS FINANCED

Up to 9,382 shares of the second preferred stock will be issued to such of the holders of the present preferred stock of the Eastern Pennsylvania Railways as may participate in the plan, in exchange for their present holdings, at the rate of eleven shares of new $8 per annum second preferred stock for each ten shares of the present 5 per cent preferred stock of the Eastern Pennsylvania Railways with accumulated dividends. In other words, for each ten shares of the present preferred stock, the dividend on which is $50 in arrears, the holder receives eleven shares of new second preferred stock, the annual cumulative dividend on which will be $88, which it is expected will be paid.

Up to 78,347 shares of the no par value common stock of the new company will be issued to such of the holders of the present common stock of the Eastern Pennsylvania Railways as participate in the plan, at the rate of two shares of new no par value common stock of the East Penn Electric Company for each share of common stock of the Eastern Pennsylvania Railways now outstanding.

The first preferred stock of the new company will bear cumulative dividends at the rate of $7 per share, per annum, each share to be entitled to $100 and accrued dividends in case of liquidation, being preferred as to assets and dividends over the second preferred and common stock. The issue will be callable at $115 per share and accrued dividends. Dividends will accumulate from Jan. 1, 1923.

The second preferred stock of the new company will bear cumulative dividends at the rate of $8 per share per annum, each share to be entitled to $100 and accrued dividends in case of liquidation, preferred as to assets and dividends over the common stock; and to be callable at $110 per share and accrued dividends. The dividends will accumulate from April 1, 1923, and will be payable quarterly.

Under the proposed plan, when consummated, the East Penn Electric Company will own an unusually efficient modern power plant costing approximately $3,000,000, and also own all or most of the present preferred stock and common stock of the Eastern Pennsylvania Railways now outstanding in the hands of the public. Against these assets it is intended to have outstanding $2,500,000 of 6 per cent gold bonds secured by a first mortgage on the new power plant; 12,000 shares of first preferred stock, bearing cumulative dividends of $7 per share per annum; and not over 9,382 shares of second preferred stock bearing cumulative dividends at the rate of $8 per share per annum, and about 100,000 shares of no par value common stock. The present power plant is expected to be kept in operating condition as a reserve, and possibly to carry peak loads.

Through a power contract or through a lease of the new power house, the East Penn Electric Company will agree with the Eastern Pennsylvania Railways to supply all, or a major part, of the power generated at the new power plant to the Eastern Pennsylvania Railways and its subsidiary companies.

May Abandon Service

Local Company in Kenosha Files Application to Discontinue Service If Jitneys Compete

The Wisconsin Gas & Electric Company has applied to the Wisconsin Railroad Commission for a permit to discontinue and abandon its service in Kenosha in the event that the operation of competing jitneys is sanctioned by the City Council. The company also asked for a determination of what may reasonably be the duty of the petitioner to continue or resume such service. The hearing on the application is set for July 12 at the offices of the commission in Madison.

The application came as a surprise to Kenosha and it is understood to have been the outgrowth of the appeal to the Council of the Chicago, North Shore & Milwaukee Electric Railway for a permit to operate buses to connect its lines on the west side of the city with the downtown districts.

There are four specific demands put up to the commission in the application of the Gas & Electric Company.

1. That it be determined that if jitney competition be restored along the petitioner's lines, the petitioner will be entitled to abandon its said street railway system and discontinue service thereon.

2. That standards of service now prescribed for said system be reviewed and modified so as to authorize the discontinuance of all service in the event of restoration of jitney competition.

3. That it be determined that the commission will not require the petitioner to operate its said street railway system at a loss.

4. That the commission fix and prescribe the conditions under which it will require the petitioner to continue to furnish present standard of service upon said system as will more fully appear from the application.

New Bonds for Retirement Purposes

The Cincinnati, Newport & Covington Railway, Covington, Ky., announces that, for the purpose of retiring the $3,709,000 first and second mortgage bonds falling due on July 1, new bonds will be issued to be known as first and refunding mortgage bonds bearing 6 per cent interest and payable in twenty-five years. They will be secured by a mortgage on the properties and franchises in Ohio and Kentucky comprising the Cincinnati, Newport & Covington Street Railway system, now operated by a company of the same name, and the South Covington & Cincinnati Street Railway.

At the present time $4,000,000 of the new bonds will be issued. They are callable at 107½ during the first five years, at 106 during the second five, at 104½ during the third five, at 103 during the fourth five and 101½ during the last period of five years. The sinking fund will be cumulative at the rate of ½ of 1 per cent per annum.

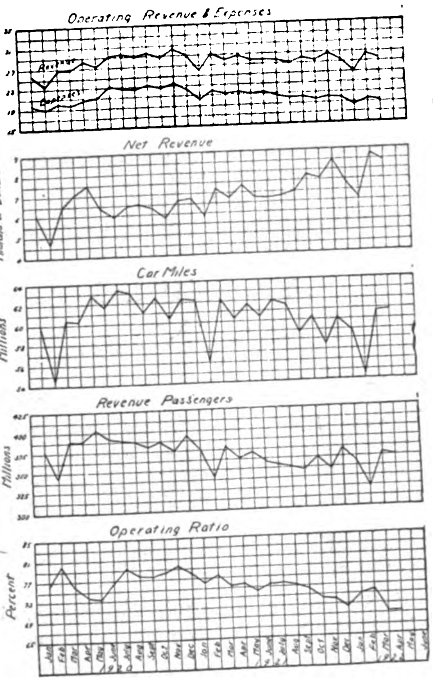
Figures Show Favorable Trend

Reports for the Last Sixteen Months from Eighty-one Companies Show Steady Improvement with Higher Net Earnings and Lower Operating Costs

EDMUND J. MURPHY, chief statistician American Electric Railway Association, has completed a tabulation for the sixteen months ending April, 1922, of the results of operation of the eighty-one electric railways whose earnings are compared at the association headquarters. According to Mr. Murphy there has been a gradual but very steady improvement of the underlying conditions of these properties and a rapidly decreasing operating ratio, which have made possible a steady increase in net earnings in spite of stagnant business.

The monthly revenue of the eighty-one companies represented in the accompanying table and charts is about $28,000,000 and represents approximately one-third of the total revenue of all the electric railways. Included in the properties compared are city lines, interurban lines, large and small systems of companies operating in all sections of the United States.

Attention is called to the decline in traffic (number of revenue passengers) which began in January, 1921, but in April 1921 became 6.5 per cent. The maximum was reached in August when there was a loss of 9.4 per cent. Owing to a higher rate of fare, the gross operating revenue did not decrease rapidly, and its maximum loss during 1921 was in September, when it was 6.6 per cent. Operating expenses, however, were decreasing and the operating ratio fell off almost as fast as traffic. This continuous decrease in operating ratio, in Mr. Murphy's opinion, is the most gratifying feature of the whole statement.



STATISTICS OF EIGHTY-ONE COMPANIES

Allowances should be made in the chart for the varying lengths of the months. Thus, for April, 1922, the lines for operating revenue, net revenue and passengers turn down, but the drop is not equal to the proportionate difference which would normally be caused by the difference in the length of the month. Actually the figures for April indicate the continuance of the favorable trend of the preceding months.

Receivership Proceedings to Be Concluded

The Fort Wayne & Northern Indiana Traction Company's receivership case—this company being the predecessor of the Indiana Service Corporation—which has been pending in the superior court for more than two years will be brought to a close with the decision in the last claim case against the receiver, the trial of which has just begun. The last claim is that of O'Connor & Sons who seek a judgment in the sum of $2,500 for grade work for the defunct traction company. After this case is concluded Robert M. Feustel, receiver for the old traction company, will file his final report and the last chapter will be written in the receivership proceedings which are said to be the most voluminous in the history of the local courts. There were nearly 1,000,000 words in the receivership decree.

Vacancy in Directorship Filled

The directors of the Cleveland (Ohio) Railway at a recent meeting elected Attorney Harry J. Crawford of the firm of Squires, Sanders & Dempsey, general legal counsel for the company, to the board of directors to fill the vacancy caused by the death early this spring of George L. Radcliffe, formerly vice-president. Mr. Crawford has been associated in a legal way with the company for twenty years and is considered an expert upon service-at-cost grants.

Commission Valuation Rejected

Brief by Interborough Rapid Transit Says Public Body's $174,221,056 Estimate Is Millions Too Low

In a brief filed with the New York Transit Commission on June 26 the Interborough Rapid Transit Company refused to be a party to the commission's proposed plan for a unified transit system and to sell its properties for anything like the $174,221,056 recommended as the value by the commission's valuation bureau. This valuation, said to be more than $40,000,000 less than the company's actual investment, was attacked as confiscatory.

The brief claimed a total valuation of $399,873,697, of which $331,747,697 was the estimate of the value of the physical property, based on the cost to reproduce, and $68,126,000 was claimed as the value of the company's subway leases. The brief attacked the commission's method of valuation as faulty in principle and with having failed to take account of many important items. In stating the specific reason why the company could not accept the commission's plan at its tentative valuation, the brief read:

> The commission's plan of September, 1921, offers only a 5 per cent return (and 1 per cent sinking fund) on the value which it may finally determine for the company's property; whereas, under contract No. 3, the company is allowed a preferential income of $11,135,000 after all operating expenses and taxes, or 8.76 per cent on its total investment in both the old and new subways.
>
> Under these circumstances the company, in justice to its security holders, cannot accept an unjustifiable reduction in its original investment along with the low rate of return proposed by the commission, especially in view of the fact that the evidence indicates the company's preferential will be earned during the entire period of the contract.

The brief contended that the United States Supreme Court, the State courts and public utility commissions had uniformly held that original cost was no proof of present value, that present value could not be ascertained in any rational manner other than by ascertaining what it would cost to reproduce the identical existing property, that the value must be fixed as of the time of the inquiry at the prices then prevailing, that appreciation as well as depreciation must be considered and that the law under which the commission's plan was developed permitted consideration of "cost to reproduce." The company said:

> The bureau, having failed to establish a value pursuant to the foregoing principles in the face of the well-known fact that the company's property can not be reproduced for anything like its original cost, its report is tantamount to a recommendation that the company's property be confiscated, which looks like an attempt to take advantage of the company's unfortunate temporary financial situation, for which the management is in no way responsible but which is due wholly to conditions brought about by the World War.

The brief attacked the "straight line" method of estimating depreciation used by the commission's engineers, and declared that the weight of legal authority was that only actual existing depreciation should be considered. It contended that the commission's engineers had discriminated against the company and in favor of the city in allowances for overhead, and had been wrong in excluding debt discount as an item. The commission's engineers were also criticised for having excluded a promotion payment of $1,500,000 in Interborough Rapid Transit stock to August Belmont, although the courts of the State had held that it was proper.

Financial News Notes

New Directors Elected.—Board of directors of the Tyler Traction Company, Sistersville, W. Va., has reorganized, electing Stephen G. Pyle, president and general manager; W. J. Neuenschwander, treasurer, and W. O. Harrington, secretary.

Receivership Hearing Adjourned.—Judge Julius Mayer has adjourned until October the hearing on the application for a receiver for the Interborough Rapid Transit Company, New York, N. Y., by the American Brake Shoe & Foundry Company and Clarence H. Venner.

Stock Offering Announced. — Bonbright & Company, New York, N. Y., are offering at 106 and accrued dividend $4,000,000 of the 8 per cent cumulative preferred stock of the Public Service Corporation of New Jersey. The stock is preferred both as to assets and dividends and will yield about 7.50 per cent.

New Georgia Issue Offered.—Stone & Webster, Boston, Mass., are offering a new issue of $2,000,000 Columbus (Ga.) Electric & Power Company 7 per cent cumulative first preferred stock, series A, convertible share for share into common stock at 96½ to yield about 7.25 per cent.

Operation Again Continued.—The Hartford & Springfield Street Railway, Warehouse Point, Conn., is to continue in operation until Dec. 15 at least, as Judge Kellogg in the Superior Court has ordered Receiver Harrison B. Freeman to continue the business for four months from Aug. 19, 1922.

Service to Be Resumed.—The Norwich & Westerly Traction Company expected to put into service again on June 30 that portion of its line between Westerly, R. I., and Hallville, just out of Norwich. Service had been suspended on this line in October, 1921. It is believed that the summer business will support the line.

I. T. S. Floats 5 per Cent Issue.—Estabrook & Company, New York, N. Y., are offering a new issue of $1,000,000 Danville, Champaign & Decatur Railway & Light Company 5 per cent bonds, due March, 1938, at 90 and interest, yielding 6 per cent. The issue is redeemable as a whole only, or in part, for the sinking fund at 104 and interest. These bonds are guaranteed as to the payment of both principal and interest by the Illinois Traction Company, Champaign, Ill.

Initial Common Dividend Declared.—The York (Pa.) Railways has declared an initial quarterly dividend on the common stock of 50 cents a share, placing it on a 4 per cent per annum basis. The dividend is payable on July 15 to stock of record of July 5. The board also declared the regular quarterly dividend of 1¾ per cent on preferred stock payable on July 30 to stock of record of July 20.

Receipts Smaller.—The Springfield (Mass.) Street Railway's receipts for the first five months of 1922 were more than $53,000 less than for the corresponding period of 1921, according to a statement from President Clark V. Wood. This is attributed to slack conditions in certain lines of industry, the effect of which is shared by the Worcester lines. The recent reduction in wages and better business in sight will count as factors in offsetting the loss of revenue.

Chattanooga Receivership Lifted. — A final decree in the receivership case of the Chattanooga Railway & Light Company has been entered in the United States District Court at Chattanooga, Tenn. The decree dismissed suits of the Commercial Trust Company and the Maryland Trust Company and lifted the receivership. It was an agreed decree, one step in the consolidation of various physical properties controlled by banking interests having their headquarters in New York and Philadelphia.

Seeks to Abandon City Service.—Another effort by the St. John's Electric Company to get rid of the franchise provisions for maintaining electric railway service in St. Augustine, Fla., has been made. W. A. Houston of the company has offered the city commissioners a proposition to maintain a much sought service to St. Augustine Beach in lieu of the contractual city service. The city service has been a losing matter for the company for months, but the commissioners doubt their authority to abrogate the franchise without consent of the people and are taking the offer under advisement.

First Dividend in Three Years.—The first dividend payment since February, 1919, to stockholders of the United Electric Railways, Providence, R. I., amounting to 1 per cent, will be made on July 1. An announcement to this effect was made by A. E. Potter, president of the company. He said that the disbursement would be made out of net earnings since the company took over the United Traction lines on July 9, 1921, and that this declaration did not necessarily mean that regular payments would be made to the stockholders. According to the plan of reorganization a 1 per cent disbursement would call for a payment of $82,848.

Traffic and Transportation

Announces Return of Five-Cent Fare

Cleveland car riders will again enjoy a nickel rate of fare either on Aug. 1 or shortly after that date, John J. Stanley, president of the Cleveland Railway, announced, following the meeting of the board of directors on June 22. Car riders are now paying a 6-cent fare with a 1-cent charge for transfer.

The directors at this meeting learned that the system in May piled up a surplus of $68,966, making an accumulated balance in the interest fund on June 1 of $393,124. The interest fund, which is the fare barometer, is expected to reach the $700,000 mark, at which the fare is automatically decreased, some time during the latter part of July. Due to wage reductions that became effective on May 1, and other economies in operation, the company's operating reserve fund accumulated a surplus of $152,737 in May, while the surplus in the maintenance and depreciation reserve fund amounts to $197,621. During May the company carried 34,591,620 riders, the largest number in any one month for the past twelve months and only 0.16 or 1 per cent less than May, 1921.

Paul E. Wilson, secretary of the company, says the May report indicates that business conditions in Cleveland are undoubtedly almost back to normalcy and that from now on the company's monthly reports will show traffic gains instead of losses, as has been the case for a year.

"The healthy condition of our various funds, together with the increase in traffic, indicates that our prediction of a return of a 5-cent fare early in August will be realized," said Mr. Stanley.

Through Service from Fort Wayne to Cleveland

Through passenger service on electric lines from Fort Wayne, Ind., to Cleveland, Ohio, has been arranged by the Indiana Service Corporation, according to an announcement just made by S. W. Greenland, general manager of the corporation. One car a day will be run through each way. This will be one of the longest through trips on an interurban railway in this part of the country.

It was originally planned to have the through service extended from the Ohio city to Indianapolis but through the inability of the Union Traction officials to agree to change their schedule to meet this, the service will only extend from Fort Wayne to Cleveland at the present time. The car which will come to Fort Wayne from Cleveland will continue south on the Indiana Service Corporation line and will make connections at Peru for Indianapolis. No definite date has been set for opening the service, but all the details have been worked out and it is probable that the schedule will be put into operation by about July 1.

Grants Fare Petition

Allowing the application of the Boise Valley Traction Company, Boise, Idaho, to make reductions on all round-trip rates where fare is greater than 36 cents, the Public Utilities Commission has granted the company's petition to lower the loop rates and make important changes in time tables. The reduction will amount to about 20 per cent of the present round-trip rate and will be effective June 16 for ninety days. The new rate will be 180 per cent of the present single-trip fare. Competition with the Oregon Short Line is given as the reason for the company's asking a reduction in fares.

Another Fare Reduction Expected

The Connecticut Company at Hartford, Conn., which voluntarily made a reduction in its fares on all lines on March 1, when it began selling three tokens for 25 cents, will make a further drop when industrial conditions improve. Mayor Kinsella of Hartford believes this step will bring about a greater use of the cars. He said that he had had many conferences with Lucius S. Storrs, president of the Connecticut Company; that Mr. Storrs had met him more than half way and that he had been assured by Mr. Storrs that when there was a sufficient improvement in the revenues with due regard to the financial obligations of the company a reduction in fares would be made.

P. A. Y. L. System Discontinued Temporarily

The P. A. Y. L. system of collecting fares has been discontinued on the lines of the New Brunswick Power Company, St. John, N. B., and suburbs of Fairville, Glen Falls, East St. John, Coldbrook, Eastmount, Beaconsfield. The company instituted the system in the hope of relieving congestion and speeding up traffic. There is no doubt but that the system speeded up traffic and relieved the congestion, but after it had been in operation a month it was found impracticable for one reason. That was due to passengers who broke through the emergency door at the rear, and escaped without paying fares. The door required repairs every day on virtually all the cars in operation, and after a close scrutiny of the number of persons who avoided paying fares and incidentally caused damage by opening the rear door, the company decided to revert to the P. A. Y. E. system, which has been in operation since the conversion of the rolling stock of the company into one-man cars.

California Railways Reduce Freight Rates

Rate reductions on the transcontinental railroads recently ordered by the Interstate Commerce Commission will concurrently apply on interstate rates, to be made effective July 1, 1922, according to announcement on June 7 by the California State Railroad Commission.

The announcement followed a conference between the commission and representatives of practically all carriers operating in California, at which the latter agreed to lower state rates to the level of the new interstate schedules. The reduction will be approximately 10 per cent of the 1920 rates and will amount to between $7,000,000 and $8,000,000 a year on California state and interstate freight traffic. In cases where the 1920 rates have already been reduced further reductions will be made to the 10 per cent level. Where rates have already been reduced by 10 per cent or more no further changes will be made. There will be no increase in rates.

In situations where certain differentials are maintained as between shipping points the relationship of rates will be continued. This in some instances may result in reductions not exactly on a 10 per cent basis. Among the electric railways represented at the conference were: Central California Traction Company, Fresno Interurban Railway, Holton Interurban Railway, Modesto & Empire Traction Company, Pacific Electric Railway, Sacramento Northern Railroad and San Francisco-Oakland Terminal Railways.

Pamphlet Shows Development of Interurban System

The Pacific Northwest Traction Company, which operates the Seattle-Everett interurban, the Bellingham-Mount Vernon and Sedro Woolley interurban lines, and the motor buses between Everett and Mount Vernon, which connect up the electric lines, has issued a new folder "The Interurban Lines," which shows that a comprehensive system of interurban transportation has been worked out, covering all the territory between Seattle and the Canadian boundary, and reaching, via Anacortes, into the San Juan Islands. The company maintains a half-hourly service out of Seattle to Everett, where the motor bus connections are made. The trip between Seattle and Bellingham is continuous and is frequent, it being possible to go straight through by leaving Seattle on the hour each day, and return in less than four hours running time. Connections are had at various points for places off the direct route, and at Anacortes with both the Vancouver Island ferry and the San Juan Island boats. All stages from Snohomish and Whatcomb Counties, points outside Everett and Bellingham, enter and leave the bus terminals operated as a part of the interurban system.

One-Man Cars May Be Added to Equipment

Operation of one-man cars in Cincinnati, Ohio, is under consideration by the Cincinnati Traction Company. Walter Draper, vice-president of the company, who made this announcement, also said that in the event the plan is adopted the one-man cars would be operated on the suburban lines first. The first intimation that the traction company had the one-man car plan under consideration was contained in a letter sent to the officers of the motormen and conductors' union by W. Kesley Schoepf, president of the traction company, in which he requested the men to accept a 10 per cent wage reduction when their contract with the company expires in July. In the letter Mr. Schoepf also requested that the clause in the contract pertaining to the use of motormen for conductors and the opposition be so modified as not to apply to the one-man car plan.

Plans Under Way for Reducing Fare

Mayor-elect A. V. Fawcett has started a campaign to reduce car fares in Tacoma, but is not yet ready to announce his plans for the reduction. Although no definite arrangement with the Tacoma Railway & Power Company has been reached, it is known that a plan for lowering fares is being formulated if tickets are purchased in blocks of twenty, with a 10-cent fare maintained for casual riders. Tentative plans provide for selling six rides for $1, with transfer privileges, or twenty rides for $1 without transfer. In return for the concession, it is suggested that the city eliminate free riding for city employees, eliminate paving between tracks for a limited period and stop its sale of electric power from the city plant outside the municipal limits. Mayor Fawcett states that he has urged upon the railway company the removal of its tracks and the substitution of trackless trolley buses.

Routing and Economies to Be Investigated

A. Morris Buck and P. J. Boeser of New York City, now in New Orleans, representing J. A. Beeler, traffic expert, will begin at once the work of making a survey of the New Orleans Railway & Light Company's property. They will have a force of about thirty technical men assisting them. After having checked up the present street car routing system that obtains here and made recommendations to the Commission Council based upon these investigations, the experts will turn their attention to the economies of the operation of the system. The difficulties which New Orleans is experiencing today are those which have had to be met and overcome in a great many cities in the United States, the experts say, where a conflicting system of routing cars prevails.

Transportation News Notes

Summer Privilege for Children.—According to a recent vote of the trustees of the Boston (Mass.) Elevated Railway children under fourteen years of age may ride for 5 cents on any line of the property during July and August.

Five-Cent Fares Effective.—Five-cent fares have gone into effect on the lines of the London (Ont.) Street Railway. Strip tickets at five for 25 cents will be sold on the cars. There will be no special rates during rush hours as before.

Receiver Wants Seven-Cent Fare Extended.—The attorney for Receiver Wells of the United Railways, St. Louis, has applied to the Missouri Public Service Commission for an extension of the present 7-cent fare until further settlement of the valuation matter.

One-Man Cars in Operation.—The Olean, Bradford & Salamanca Railroad, Olean, N. Y., has started the operation of one-man safety cars on the local lines of the company in Olean. It is planned to place them in service very shortly in Salamanca, N. Y., and Bradford, Pa., in which the company operates the local traction service.

Equipment Changes Made.—The rolling stock of the New Brunswick Power Company in St. John, N. B., and suburbs has been entirely repainted in green, replacing the red. The large electric signs on the roof of the cars have been removed. Painted signs have been placed in the front windows and also on the side windows near the ends of the cars.

Card Gives Operator's Name.—An innovation on the part of the New Brunswick Power Company operating the railway in St. John has been the placing of cards in each of the cars naming the operator of the car. The card reads as follows: This car is operated by ——— ———. The cards, 18 in. x 10 in., were placed in the advertising racks.

Petitions Against One-Man Cars.—As the result of a recent accident in Meriden, Conn., in which a one-man car figured, a petition has been sent to the Public Utilities Commission protesting the use of one-man cars in the city. There was a hearing some weeks ago on the objection of the city of Meriden to one-man cars at places with steep grades. The commission at that time dismissed the petition.

Allows Freight Reductions.—Under an order issued June 13 by the Public Utilities Commission of Utah, interstate railroads operating in Utah are permitted to reduce their intrastate freight rates to a parity with the interstate rates ordered reduced by the Interstate Commerce Commission effective July 1. The order follows an application to like effect presented in behalf of the Utah railroads by the Pacific Freight Traffic bureau.

Special Rates Being Arranged.—New tariffs are being filed with the interurban connections of the Northwestern Ohio Railway & Power Company at Toledo, Ohio, for points in western and central Ohio. A special commodity rate is also being prepared for points on this railway to Ryan, Ohio. This will be a material reduction in carload rates when handled in box cars and is being made for the purpose of competing with local truck lines. The new tariffs will apply particularly to shipments of the fruit crop.

Interurbans Agree on Fare Cut.—The plan for putting into effect the 1,000-mile book by the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has been indorsed by the Eastern Wisconsin Public Service, Milwaukee Northern, Wisconsin Traction, Light Heat & Power and the Wisconsin-Minnesota Light & Power Companies. The details of the scheme in effect on the lines of the Milwaukee Electric Railway & Light Company's lines were outlined in the *Electric Railway Journal*, issue of May 6, 1922.

Six-Cent Fare Extended.—The City Council of Vancouver, B. C., recently extended the period of time in which the British Columbia Electric Railway is authorized to charge a 6-cent fare in Vancouver, to Dec. 15, 1922. The 6-cent fare agreement normally would have expired shortly. The railway agreed, in return, to extend its service and to maintain its present wage scale to employees until a new fare agreement is reached, either before a board of arbitration, or by the proposed utilities commission which may be set up by the provincial government this summer.

Coins Instead of Tickets. — The Northern Massachusetts Street Railway, Athol, Mass., recently bought 30,000 metal coins for use in place of car tickets sold at a reduced rate. So heavy is the demand for these that it has been found necessary to order 20,000 more. On investigation it was found that the unexpectedly large purchases of the coins were due to withdrawals by residents of the rural towns, who buy several dollars' worth and keep them until they are used, whereas the urban patrons, riding more frequently, keep the coins in circulation.

Seven-Cent Fare Extended.—An ordinance has been passed by the City Council of Cincinnati, Ohio, granting the Cincinnati, Lawrenceburg & Aurora Electric Street Railroad permission to continue a 7-cent fare within the city limits for a period of one year from July 9. Stanley Shaffer, attorney for the receivers of the interurban company, had asked for a two-year extension of the rate of fare. The committee on street railways decided, however, that conditions in another year may warrant a reduction and that if they did not, the ordinance might be re-enacted for another year.

Personal Mention

Presidency Changes in West

William von Phul Leaves Market Street Railway for New York—C. N. Black Succeeds Him

William von Phul, president and general manager of the Market Street Railway, San Francisco, Cal., has resigned to give his entire attention to Ford, Bacon & Davis, Inc., of which he is president and whose interest will require his continuous presence in New York. His resignation is to be effective July 1. Mr. von Phul went to San Francisco six years ago from New Orleans where he was identified with railway properties of the Ford, Bacon & Davis company. For three years he was vice-president and general manager and the last three years has been president of the San Francisco system. A statement expressing his regret at leaving San Francisco includes the following comment: "San Francisco must realize that without a unified system of transportation through municipal ownership, or some modification of its present franchise granting powers which will permit a private corporation to develop in peace with the city, it cannot realize its full development."

Col. C. N. Black, vice-president of Ford, Bacon & Davis, Inc., has been appointed by the board of directors of the Market Street Railway to succeed Mr. von Phul as president and general manager. Mr. Black was president of the American Electric Railway Association in 1915 and was at that time vice-president and general manager of the San Francisco system which was then called the United Railroads. His connection with the system dates back to 1907 and was terminated in 1916 when he resigned to become purchasing agent for the Allied Ordnance Department. Later he was commissioned in the U. S. Army and went overseas as assistant chief of ordnance in the American Expeditionary Forces. In announcing Colonel Black's appointment, the board of directors of the Market Street Railway stated that no other changes in the organization were contemplated at this time.

R. W. Altekruse to Adjust Claims

Robert W. Altekruse has been appointed claim adjuster of the Indiana Service Corporation, Fort Wayne, Ind., the Fort Wayne, Van Wert & Lima Traction Company, Lima, Ohio, and the Fort Wayne & Decatur Traction Company, Decatur, Ind. Mr. Altekruse succeeds F. R. Fahlsing who died recently.

Mr. Altekruse's railway connections began in 1912 when he joined the Fort Wayne & Northern Indiana Traction Company, as assistant cashier in the auditing department. A year later he was appointed assistant claim adjuster of that company and has continued in this capacity until his present promotion as claim adjuster. Mr. Altekruse is a graduate of the Fort Wayne Business College.

B. E. Tilton, President

Vice-President and General Manager at Syracuse Heads New York Electric Railway Men

©Kessler Studios

B. E. TILTON

To know the new president of the New York Electric Railway Association in his job as manager of the New York State Railways at Syracuse one might think that he was born to that estate, so naturally does he go about the work of discharging the duties of the executive post. Such is not the fact, however. Benjamin E. Tilton was not born to any such estate. He is by profession an engineer. But he is not an engineer first, last and all the time. If he were he would probably not be an executive. Many very able executives were trained originally as engineers, but they are not successful executives because of such training, but to a large degree in spite of it. The engineer who aspires to become an executive must be able for a substantial part of the time to forget that he is an engineer and use the exact knowledge of his technical training as a balance wheel to prevent him from attempting, as an executive, to accomplish the impossible. This is just what Mr. Tilton has been able to do.

To those who have watched him at work, Benjamin E. Tilton's present job looks easy. This is only because Mr. Tilton has mastered the job instead of letting the job master him. His engineering training helped him to do this. In fact, no task is ever likely to master Mr. Tilton that can be accomplished by the application of a combination of tact, tenacity and technology. Mr. Tilton brought all three of these adjuncts to bear on his first job down in Porto Rico with the government service making geodetic and coast surveys and he has been using the combination with success ever since. And with every new application of them by Mr. Tilton has come added ease in their use and greater success to their possessor through their application.

It was said that the government work in Porto Rico was Mr. Tilton's first job. Well, it was his first job after he was graduated from Cornell in 1897. He was in Porto Rico for three years. And then came to Mr. Tilton the call of private enterprise. It was a loud call, and he heeded it to become engineer of construction of the Pennsylvania Lines West and was located at Fort Wayne and Cleveland for six years. At Cleveland Mr. Tilton's fine work attracted the attention of the management of the Cleveland Railway and he was induced to join the select circle of very able men who administer that property. His title there was engineer of maintenance of way. Then and there Mr. Tilton was won over to the electric railways. His next connection was with the Rochester Railway & Light Company as engineer of maintenance of way of city and suburban lines. The Rochester lines are tied in with the New York State Railways and so it was in reality only a step for Mr. Tilton in his upward climb from the post in Rochester to the position of general manager of the Syracuse Rapid Transit Company, Utica & Mohawk Valley Railway and the Oneida Railway. His election as vice-president followed quite logically. In this dual post at Syracuse Mr. Tilton also has jurisdiction over the Oneida and the Utica lines.

W. C. Kline Temporarily Succeeds D. H. Blanks

According to an announcement made at the offices of General Manager E. B. Moore, W. C. Kline assumes the duties of active manager of the railway department of the Monongahela Power and Railway Company at Fairmont, W. Va. This follows the resignation of Vice-President Don H. Blanks. Mr. Kline, who has been chief engineer of the company for a number of years, will continue in this capacity, dividing his time between the two departments.

While his education and training have been along engineering lines, Mr. Kline is no stranger to the railroad operating business. He came to the local company from the Western Maryland Railway, where he was one of the young engineers on the staff of Carl R. Gray. His association with the operating department of that system makes him fitted in every manner for the work that has been assigned to him.

The order placing him in charge of the operation of the local railroads states that he will serve in this capacity until the vacancy is permanently filled.

Manufactures and the Markets

DISCUSSIONS OF MARKET AND TRADE CONDITIONS FOR THE
MANUFACTURER, SALESMAN AND PURCHASING AGENT

ROLLING STOCK PURCHASES BUSINESS ANNOUNCEMENTS

Business Conditions

In discussing market conditions the National Bank of Commerce, New York, states that industrial stability has been more nearly attained in the past thirty days than at any time since the beginning of the World War. Some industries have shown moderate gains, in others conditions have altered but little and in a few lines a seasonal dullness has occurred. The unfavorable factors in the situation are the continued deadlock in the coal strike and in the textile mills of New England and threats of strikes by those classes of railroad labor affected by recent decisions of the United States Labor Board.

Iron and steel output for May showed further gains, and the unfilled orders of the United States Steel Corporation have increased.

The cement, lumber and brick industries have met with some difficulty in satisfying demand because of the large volume of building and construction under way throughout the country.

In the past month there have been important decisions affecting the railroads. These are a horizontal cut of 10 per cent in freight rates, a reduction to 5¾ per cent of the "fair return" basis for purposes of fixing rates, and a series of wage reductions affecting 800,000 men. The effect of the cut in freight rates can not now be gauged, and the reduction in the "fair return" basis is not likely to have any immediate effect, but the action of the Interstate Commerce Commission is regarded in some quarters as indicating a continuation of its policy, which has militated against securing adequate capital. Wages constitute the most important phase of the problem of rates. The reductions ordered by the United States Railroad Labor Board are estimated at $100,000,000 annually.

Difficulties Met in Putting in New Track

Last of the cable equipment in the Twin Cities is being torn up with the relaying of the trolley rails on Selby Avenue in St. Paul. The street railway system in St. Paul was electrified before the cable equipment was utilized in Minneapolis and the rails and underground work long ago disappeared, but in St. Paul the cable was utilized on Selby Avenue until the hill was tunneled some time ago, giving better access to lower town. Workmen find the rails and channels were laid in imported cement, which is as hard as granite to break up. Because a diamond drill has to be utilized to break up the roadbed, and the steel channels for the cable have to be cut with oxyacetylene gas, the relaying of the road on Selby Avenue consumes more time than is usually required for similar work.

Chambers of Commerce to Appoint Coal Committees

Julius H. Barnes, president of the Chamber of Commerce of the United States, has asked the members of that organization to help prevent a "runaway" coal market, by appointing fuel committees to make a survey of the local coal situation. In a letter urging such action, Mr. Barnes speaks of Secretary Hoover's suggestion to the utilities, railroads and metallurgical industries that each appoint a buyer's committee to secure and distribute such coal as is needed by these industries, and he believes that for the same reason local communities can best act through their local chambers of commerce.

Cars Under Construction for Georgia Railway

Twenty new trolley cars are now under construction at Paris, Ill., for the Georgia Railway & Power Company, and will be delivered in Atlanta by Oct. 1, 1922, and immediately pressed into service, according to F. L. Butler, general operating manager of the company. The cost of these cars is $13,000 each and they have seating capacity for forty-eight passengers.

Mr. Butler stated that during 1921 the company added twenty-nine new cars to its equipment and that during the next five years it plans to add twenty-five to thirty of the large type cars annually. The older cars are to be gradually retired.

The present order is the last the company will place with outside concerns as hereafter the cars used in Atlanta will be constructed at the railway company's own plant, operations to be resumed there in the early part of 1923, Mr. Butler stated. This plant has been shut down since the war.

New Rails Planned

Seven miles of track on the combined Connecticut Valley, Northern Massachusetts and the Concord, Maynard & Hudson Street Railway systems, operating in Greenfield, Athol and Maynard, Mass., respectively, are to have new rails this season. Prominent among the renewals is a 1½-mile stretch extending from the railway station northward in Deerfield Street, Greenfield. New track will be laid over the concrete bridge across Millers River in Athol when that structure is completed. Beginning June 17 cars were routed over a temporary bridge.

These companies have gradually converted their cars into the one-man type until more than 90 per cent of the entire outfit is being operated on the one-man plan, with satisfactory results.

ELECTRIC RAILWAY MATERIAL PRICES—JUNE 27, 1922

Metals—New York

Copper, electrolytic, cents per lb	13.812
Lead, cents per lb	5.75
Nickel, cents per lb	36.00
Zinc, cents per lb	5.625
Tin, Straits, cents per lb	31.00
Aluminum, 98 to 99 per cent, cents per lb	19.00
Babbitt metal, warehouse, cents per lb.:

Standard Bessemer steel rails, gross ton	$35.00
Standard open hearth rails, gross ton	$40.00
Railroad spikes, drive, Pittsburgh base, cents per lb	2.30
Tie plates (flat type), cents per lb	1.875
Angle bars, cents per lb	2.40
Rail bolts and nuts, Pittsburgh base, cents, lb.	3.625
Steel bars, cents per lb	1.675
Ties, white oak, Chicago, 6 in. x 8 in. x 8 ft.	1.35

Hardware—Pittsburgh

Wire nails, cents per lb	2.25
Sheet iron, (24 gage), cents per lb	4.20
Sheet iron, galvanized, (24 gage), cents per lb	4.90
Galvanized barbed wire, cents per lb	3.10
Galvanized wire, ordinary, cents per lb	2.75

Waste—New York

Waste, wool, cents per lb	13.00
Waste, cotton, (100 lb. bale), cents per lb.:	
White	9.50
Colored	7.50

Paints, Putty and Glass—New York

Linseed oil, (5 bbl. lots), cents per gal	91.00
White lead, (100 lb. keg), cents per lb	12.25
Turpentine, (bbl. lots), cents per gal	1.48
Car window glass, (single strength), first three brackets, A quality, discount*	84%
Car window glass, (single strength), first three brackets, B quality, discount*	86%
Car window glass, (double strength, all sizes, A quality), discount*	85%
Putty, 5 lb. tins, cents per lb	4.75

*These prices are f.o.b. works, boxing charges extra.

Wire—New York

Copper wire base, cents per lb	15.75
Rubber-covered wire, cents per lb	6.25
Weatherproof wire base, cents per lb	15.50

Paving Materials

Paving stone, granite, 4 x 8 x 4, f.o.b. Chicago, dressed, per sq.yd	$3.20
Common, per sq.yd	3.00
Wood block paving 3½, 16 treatment, N. Y., per sq.yd	2.17
Paving brick, 3½ x 8½ x 4, N. Y. per 1,000 in carload lots	49.50
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd	1.75
Cement, Chicago consumers net prices, without bags	2.07
Gravel, ¾-in., cu.yd., N. Y	1.75
Sand, cu.yd., N. Y	1.00

Old Metals—New York

Heavy copper, cents per lb	10.00
Light copper, cents per lb	9.187
Heavy brass, cents per lb	5.625
Zinc, old scrap, cents per lb	3.062
Yellow brass, cents per lb (heavy)	5.50
Lead, heavy, cents per lb	4.50
Steel car axles, Chicago, net ton	$14.75
Old car wheels, Chicago, gross ton	18.25
Rails (short), Chicago, gross ton	16.25
Rails (relaying), Chicago, gross ton	25.00
Machine turnings, Chicago, gross ton	6.50

Passenger Cars Ordered During First Part of 1922

The Number of Passenger Cars Ordered by Electric Railways in the United States from Jan. 1 to June 15, 1922, Exceeds the Total Number Ordered During the Entire Year of 1921

From the large number of orders for passenger cars which were being reported in our Rolling Stock columns, it was evident some time ago that a large number of new cars were being purchased by electric railways. To obtain definite information, the editors have asked the various carbuilders to furnish a list of car orders placed between Jan. 1 and June 15, of this year. The accompanying table shows the results of the information received from the carbuilders, together with information which we have previously published in our Rolling Stock columns. This method of obtaining information as to the cars ordered differs from that usually practiced by the *Electric Railway Journal* in its statistical issue published the first of each year, as in the statistical issue information is obtained direct from the various operating companies and is supplemented and checked by information received from the manufacturers. In this case, no attempt has been made to solicit information from operating companies. Also, no orders have been tabulated for cars outside of the United States. Several orders have been reported for Mexico, South America, South Africa and Canada, which shows that there is considerable buying for export also.

The total number of passenger cars ordered, as indicated by this information, is 1016. This exceeds the number purchased during 1921 by 122 cars. In the information received, no attempt has been made to tabulate orders for work cars or miscellaneous equipment and the orders shown are for passenger cars only. The list certainly looks good and it is evident from the large number of railways who are contemplating orders, that the buying from now on will be still more active. The recent stiffening of the steel market and the competition for skilled labor, which has set up, due to the buying activity in the steam carbuilding industry, may have an effect upon the price of rolling stock for electric railways. It would therefore seem that the present is the best time to buy.

A study of the accompanying table shows that orders for safety cars still constitute the large amount of the rolling stock and that the buying has been almost entirely for city and suburban service. Considering the classes of equipment ordered there were 443 safety cars, 107 special type of one-man cars, 404 other types of city cars, 12 interurban cars and 50 elevated cars ordered.

In the arrangement of the table, the various companies have been separated into districts, as has been the standard practice of this paper in tabulating such information for several years past. As is to be expected, the districts north of the Ohio and east of the Mississippi River have purchased the greatest number of cars, this being 324. The district west of the Mississippi has purchased 271 cars, the New England district 246 and the district south of the Ohio and east of the Mississippi 175 cars. It is evident that the car orders are quite generally distributed over the United States, which is a further indication that improved conditions in the electric railway industry are quite universal.

New Line for Miami, Oklahoma

Miami, Okla., will have a new electric line to Pawhuska in the near future. Miami has already raised her quota of $210,000 for the new line. The Chamber of Commerce of Miami is back of the new electric railway and will do all in its power to see the road completed. The Northeast Oklahoma Railroad will extend its line from Miami. This road has been for some years past a steam line, connecting Picher, Century, Cardin, with Miami on the south. Recently this road was electrified and was made an important unit in travel between Joplin, Mo., and Miami, Okla., connecting with the Southwest Missouri Railway at Picher. With the electric railway from Carthage, Mo., to Miami, Okla., and with the completion of the line to Pawhuska there will be electric lines for a distance of more than 140 miles. The Northeast Oklahoma Railroad has its main offices at Miami. H. B. Cobban is the general manager.

Track and Roadway

Southwestern Gas & Electric Company, Texarkana, Ark., has started the work of raising and lowering its tracks on paved streets to conform to the established grades of the streets.

Three Rivers (Que.) Traction Company is contemplating extensions on Boulevard Normand, Bellefeuille and St. Phillippe Streets. They will cost in the neighborhood of $75,000.

Boise (Idaho) Railroad and the Idaho Traction Company have entered into an arrangement for eliminating duplication of service. The agreement takes into consideration the extension of the Eighth Street line from Front to Julia Davis Park.

New York, N. Y.—Bids were received by the Transit Commission on June 9 for the furnishing and installation of 1,200 enameled direction signs to be placed in the Interborough and Brooklyn Rapid Transit subways, and bids for the completion of built-in newsstands in stations on several of the new lines. The several bids upon both contracts have been referred to the commission's engineers for report.

Indiana Service Corporation, Fort Wayne, Ind., petitioned the board of public works of Fort Wayne for a double track franchise on Columbia Avenue to Kensington Boulevard to a width of 17 ft. 1 in. and the petition was granted by the board of works. The Western Construction Company was given the contract. The petition of the corporation for a franchise to extend the Columbia Avenue lines from Kensington to Anthony Boulevard was referred to the city attorney for an opinion. The board is favorable to the project, it is said.

Dallas Southwestern Traction Company, Dallas, Tex., has been granted an extension until Dec. 31, 1922, for building the first 10 miles of the proposed interurban line from Dallas to Denton, Tex., a distance of 30 miles. The original franchise was granted the Dallas Southwestern Traction Company, headed by E. P. Turner as president, on Sept. 30, 1917, and since that time there have been numerous extensions. The company represented that the costs of grading for its line between Dallas and Irving, a distance of 10 miles, have been found prohibitive, exceeding by far original estimates.

Dayton & Western Traction Company, Dayton, Ohio, has been granted a fifty-year franchise in Montgomery County, Ohio. Resolutions to this effect were adopted by the county commissioners at a meeting held on June 19. The company's first franchise, running for a period of twenty-five years, expired March 11, 1922. Since that date, negotiations for the new franchise have been in progress. Application for a fifty-year franchise was first made by counsel for the company, but the county refused to grant the request until a clause was inserted in the franchise whereby the franchise would be terminated automatically if the railway company ceases to operate an electric railway service over the present right of way.

Power Houses Shops and Buildings

Water Plant Sold by Akron Company.—By a vote of more than four to one the electors of Kent, Ohio, at a special election recently approved a bond issue of $200,000 with which to purchase the property of the Kent Water Works, now owned by the Northern Ohio Traction & Light Company, Akron. The purchase price of the plant is $135,000. The additional sum of $65,000 will be used to build an addition to the plant.

Suburban Railroad Terminal Plan Considered.—The New York Transit Commission indicated on May 28 that it has had some informal discussions with the Westchester Rapid Transit Commissioners and with local railroad engineers in New York with reference to the possible utilization of the carhouse block at Thirty-second and Thirty-third Streets and Fourth and Lexington Avenues as a great new central terminal, especially for the handling of Westchester and Long Island traffic. The three other corners of the great quadrangle, namely, the Grand Central, Times Square and Pennsylvania terminal, are highly developed as traffic distribution centers. The Grand Central and the Pennsylvania terminals have almost reached their track capacity for incoming trains, and further accommodation of growing Westchester traffic is an immediate problem. It was at the request of the parties most directly interested in the future handling of this growing traffic that the Transit Commission has taken up the subject.

Professional Note

John F. Layng, of Hemphill & Wells, consulting engineers, New York, is the author of a pamphlet entitled "Our Job and the Basis of Its Enjoyment." It relates to the hiring of men, the viewpoint of a new employee toward his job and of the old employee toward both his work and the new man, and finally the side of the employer. Each public utility executive is urged to make a self-analysis along the lines of a questionnaire given in the book in regard to his relation with employees and the public.

Trade Notes

Walter S. Goll has been appointed manager of the Fort Wayne (Ind.) works of the General Electric Company to succeed F. S. Hunting, recently resigned.

Missouri Car Company, St. Louis, Mo., announces the removal of its offices from Central National Bank Building to Suite 310, Chemical Building, St. Louis.

H. Blanco Fombona of Guatemala City is now in the United States, where he intends to study trackless trolleys. Mr. Blanco Fombona has been granted a concession by the Guatemalan Government to operate in that country a trackless trolley service. His present address is Hotel Bristol, New York.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., announces that it has received an order for motor car and substation equipment from the Chichibu Railways, which operate in the vicinity of Tokio, Japan. A large part of the equipment on this order will be a duplicate of a similar order shipped from the Westinghouse Company's plant and placed in operation during the past year.

General Electric Company Schenectady, N. Y., announces that Charles Neave has resigned as director and chairman of the board of the International General Electric Company, and Gerard Swope, new president of the General Electric Company, has resigned as president of the International General Electric. Anson W. Burchard, vice-chairman of the board of the General Electric Company, has been named chairman of the board and president of the International General Electric Company.

New Advertising Literature

Century Wood Preserving Company, Pittsburgh, Pa., has recently issued Bulletin No. 21 decriptive of the process of adzing and boring cross ties.

The Fulton Company, Knoxville, Tenn., has just issued catalog No. 100 on Sylphon heating specialties, temperature and pressure controlling instruments, valves, etc.

MacGovern & Company, Inc., New York, N. Y., has issued catalog No. 51 describing power machinery, which it has on hand ready for immediate shipment. The company buys and sells used machinery.

The J. G. Brill Company, Philadelphia, Pa., has issued Bulletin No. 263, descriptive of the 79-E Truck. The booklet tells how the design of this truck meets all the requirements of the modern Birney safety car.

Conveyors Corporation of America, Chicago, Ill., has issued a booklet entitled "Cut Ash Handling Costs." The booklet treats of the steam jet conveyor method of ash handling and contains a description of the conveyor and its method of operation.

Spencer Trask & Company, New York, N. Y., recently issued a circular describing a selected list of bonds of water power companies. As an example of the highest type of hydro-electric investments, the bonds of the Shawinigan Water & Power Company are specified. Bonds of the Nevada-California Electric Corporation are recommended to investors who desire a higher return than 5 per cent.

Automatic Substation Control Is Now in Third Phase of Development

FROM the discussion, at the recent Niagara Falls meeting of the American Institute of Electrical Engineers, on the automatic substation with particular reference to electric railway use, it is evident that power distribution engineers are now emphasizing the economic aspect of automatic control.

Thus it appears that the manless substation, like all successful inventions, has passed through two phases of its career and is now in the third. The first was primarily that of the invention period, the second had to do with selling the new idea to the public and the third is, of course, its adaptation to power-distribution conditions all round.

The several stages of progress can be epitomized in these three questions, respectively: (1) What physical principles are available for performing by electrical and mechanical means the functions now or previously requiring brain and hand power? (2) How can operators be convinced that the inventions resulting from the utilization of these principles are applicable under their conditions? (3) When, where and how should the equipment be installed to secure the greatest return in quantity and quality of service per dollar of investment and per dollar annually expended in operation?

At the A. I. E. E. meeting Messrs. Crecelius and Phillips, both formerly connected with the power department of the Cleveland (Ohio) Railway, read a paper which is the result of many years of study of the broad principles involved in the application of automatic control. While they were still connected with the railway, its management decided upon the gradual replacement of manual by automatic control in Cleveland. This replacement is now under way. The conclusion was not reached without an exhaustive study, because it was realized that reliability of service is the prime consideration, and there must be no interruption hazard introduced by the change. As a result of the general analysis and the actual installation of a few substations in Cleveland some important technical developments in the art have been made within the past two years or so, and in fact are still being made.

It is true that in the discussion which followed the presentation of the Crecelius-Phillips paper their conclusions were not all agreed with. W. E. Bryan, superintendent of power, United Railways of St. Louis, in particular, took exception to several. This fact is not to be deplored. It is too early yet for general agreement on the requirements of so young an art; in fact, engineers are far from agreeing regarding far older technical and economic questions. Local conditions control in all cases. All that the engineers can do is to agree on fundamentals—they can then be trusted to work out the local details satisfactorily.

To return to automatic control itself—the evolution of this control in the eight brief years of its history has been traced in a succession of articles and statistical tables in the columns of this paper. Each significant item of progress has been chronicled, as manufacturers and railway engineers have applied the results of their experiments. The control is not yet physically perfect, perhaps never will be. But it is now generally recognized as a reliable piece of equipment which is to be purchased or not as a reply to the question—"Do we need, and can we afford not to have it?" rather than—"Will it work?" The present great interest in automatic control is due almost entirely to necessity. Power costs must be reduced; here is one practical way to limit them. The necessity is not so critical as it was during and soon after the war, but it is still here.

Union Domination the Issue in Buffalo

MEMBERS of the Amalgamated local in Buffalo have gone on strike. The issue is a clean cut one. The International Railway, under the direction of Mitten Management, Inc., will not agree to the demands of the men for a closed shop. In its effort to throw off union domination the management of the railway has the backing of the Buffalo Chamber of Commerce and other influential interests tired of short-sighted labor rule of industry in that city. On their part the union men, through their representatives, announce that they "will resist any un-American attempt to force us into social subjection, though the plan may be governed by the most benevolent despot on earth."

The situation thus briefly outlined presages a fight to the finish. The phrase "the most benevolent despot on earth" is evidently supposed to be a true likeness of Thomas E. Mitten. Of that more will be said later. Unknowingly, of course, the Amalgamated local in Buffalo has painted a pretty good picture of itself in the phrase about the despot, but none would associate with that body the term benevolent. Last year the United Traction Company of Albany threw off the yoke of union domination after a long struggle following dictation of its affairs extending over many years. A similar condition has long existed in Buffalo. A year ago a truce was patched up in Buffalo at which Mr. Mitten took no notice of the Amalgamated Association.

The union men at Buffalo see Mr. Mitten through a glass darkly. It is only to be expected that they would. However inaccurate the picture may be which presents Mr. Mitten as a despot, he certainly has been nothing if not benevolent. His record at Philadelphia testifies to this. There wages have been advanced beyond the original dream of the men as a result of his co-operative efforts between management and men, savings have been promoted among the employees and the men and women there have a large monetary interest in the company. So far has his program been carried that criticism has been pretty general in some quarters of the extent to which he has gone to have the workers become financially interested in the railway there and participate in the management of the company. If anything similar to this has been accomplished by organized labor anywhere in behalf of the workers on electric railways, the facts have apparently escaped the attention of the historians.

It has been said that Mr. Mitten's system of management is not a plan, but rather a man. Like all other aphorisms this is true only in part. This much is certain, however—Mr. Mitten does not want to rule labor, but neither will he let labor rule him. In this phase of the struggle in Buffalo he is fighting a battle in behalf of the entire industry.

Power Substations Can Be Made Noiseless

CIRCUMSTANCES arise occasionally which demand that a substation for the transformation of electric railway power be made practically noiseless. In a quiet residence neighborhood the penetrating whistle of some rotary converters offends the ears of the fastidious. Sometimes circumstances may arise in which the "rotary" and its accompanying apparatus must be located near offices or other rooms or buildings in which quiet is at a premium. It is, therefore, desirable for the power engineer and the general manager of an electric railway property to be somewhat familiar with acoustics from this point of view, so that they may be ready to meet a special condition such as this.

An illustration of the rendering of a substation noiseless, on the property of the Birmingham Railway, Light & Power Company, was given in the issue of this paper for March 13, 1920. In that case practically the only noise producer, the rotary converter, was inclosed in a windowless room and the ventilating air was baffled to eliminate sound waves. The machine was mechanically insulated, also, to localize vibration.

Another and still more recent example is furnished by the Garvanza substation in Los Angeles, which is the subject of an article in this issue. This is doubly interesting because the control is of the automatic type. In this case the ventilating air is forced through a circuitous path and the whole equipment is housed in a windowless building. The walls of this building are heavily buttressed so that vibration production is discouraged. The automatic control lends itself admirably to a noiseless arrangement, as it is not necessary to provide for the convenience and comfort of operators other than the inspectors.

The architectural problem involved in the noiseless substation is one of some difficulty, if the building must be made to harmonize with the surroundings. A windowless building is not inherently attractive, because it is unusual in appearance. Heavy buttressing, also, is apt to give a small building a clumsy aspect. The pleasing result achieved in Los Angeles is thus the more creditable.

While it may not often be necessary to go to such lengths as was done there and in Birmingham to secure noiselessness, the fact that these particular designs have proved successful will furnish confidence that equally good results can be secured elsewhere.

Fares Have Elastic Limits, Too

THIS period of economic deflation or shrinkage ineluctably calls for a downward revision of fares even if the existing fares do not seem high enough to the operator who is trying to whittle away preceding deficits. When many of the patrons are either out of work or working only part time at lower wages, there is neither popularity nor profit for the railway which does not move with the economic trend, regardless of the sound justification of retaining longer the high rates that were so tardy in coming.

Downward revision of fares does not necessarily mean a reduction in the cost of the single ride. On the contrary there may be a downward revision coincident with an increase in fares. What is in mind is the use of plans which not only hold all of the compulsory riding of a community, but also attract that freer off-peak riding that is essential to a dividend-paying railway. Such off-peak riding will not come in straitened times unless the patron is offered something reasonable and attractive in the rate of fare. A variety of plans are available.

There is, for example, the special case of an incline railway. When the operator introduced a ten for 25-cent ticket rate, business went to capacity and revenue exceeded the results of a 5-cent straight fare policy. In a second case, the use of monthly passes gave regular riders a 6-cent fare and irregular ones a 10-cent fare with satisfaction to all concerned. In a third case, the use of weekly passes enabled the operator to eliminate most of his jitney competition, earn more revenue, leave single-trip and ticket fares where they were and still cut the fare in half for nearly half of the riders. In a fourth case, the installation of a simple zone fare has saved the situation because the short-ride majority which enjoys the lower rates is determined not to be penalized for the long-ride minority.

These examples do not exhaust the possibilities of giving a reduction in fare coincident with maintaining and even increasing revenues. They suffice to show, however, that it is not the average rate of fare per ride that tells so much as the product of rides times rates of fare. Only totals and net count.

Will the Industry Finance the Proposed Rail-Joint Tests?

IN COMMENTING upon the plans of the committee on welded rail joints, which hopes to do some real research in the field covered by its name, this paper recently referred to a probable request for funds addressed to electric railways. Since then the proponents of the testing program, largely electric railway engineers, have suggested that the American Electric Railway Association might be willing to finance the tests.

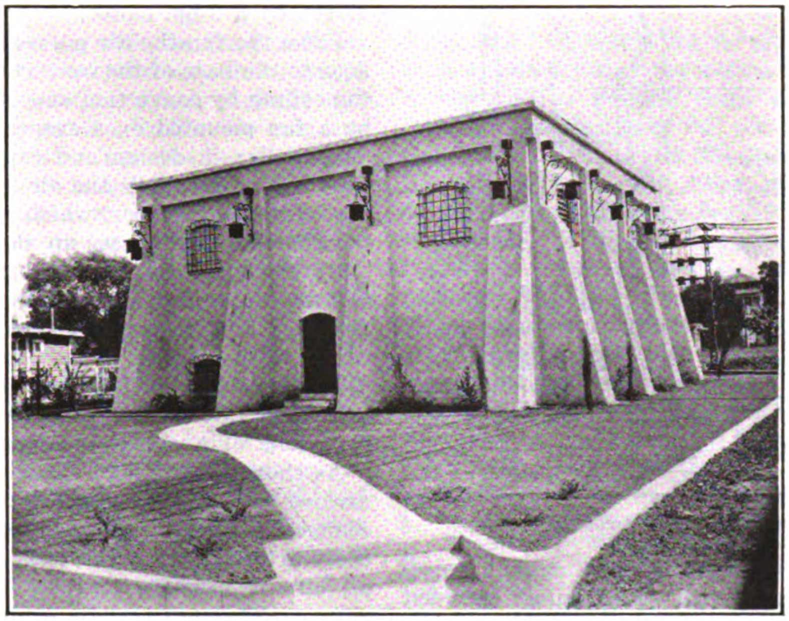
If at all feasible, it would appear best to supply the needed funds by a lump appropriation rather than by the time-honored but monotonous "passing of the hat." No doubt the railway companies will cheerfully furnish the money if necessary, but the other method will be more dignified and more convenient. Besides, the achievement of creditable results of the sort confidently expected would be a "feather in the cap" of the association.

The Special Safety Issue of This Paper Will Appear July 22

Noiseless Substation for Los Angeles Railway

By Means of a Circuitous Route for the Sound-Laden Air the Designers Were Able to Muffle the Noise from the Machinery—The Building Is of Massive Design and Harmonizes Architecturally with the Neighborhood

By George E. Campbell
Chief Draftsman Los Angeles Railway Corporation



Exterior of New Automatic Substation in Los Angeles, Designed for Beauty and Noiseproofness

IT RECENTLY became necessary for the Los Angeles Railway to extend its distribution system by erecting additional substations, particularly to supply power necessary for heavy morning and evening peaks.

To carry out this plan it was necessary to place some of the substations in residence districts of the city, in regions where the restrictions against the erection of industrial building are extremely rigid.

In order to secure the sanction of the City Council for the erection of substations in these portions of the city, the railway had to agree to erect sightly buildings, housing apparatus which would operate noiselessly. Of course, noiseless machinery of the kind necessary for the operation of an electric railway could not be obtained, so that the buildings had to be designed to absorb the noise within themselves and at the same time not interfere with proper ventilation of the machinery.

The engineering department of the corporation was not able to find many data as to noiseless substations, and was consequently obliged to do some pioneer work in this field. The first of the attractive, noiseless substations erected was the one known as the "Garvanza" substation, which has now passed the inspection of the city fathers and has been pronounced both attractive and noiseless. Satisfaction having been given with this substation, permission has been granted for the erection of others designed along the same general lines.

Details of the features of the design which have to do particularly with the points already mentioned will be given, in the hope that they may be useful to other electric railways having to install substations in residence districts.

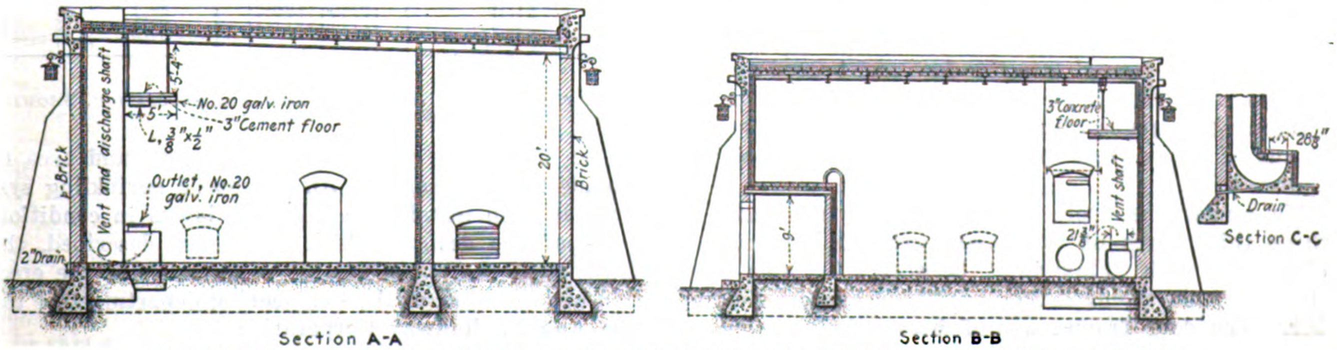
The equipment consists of a 1,000-kw. General Electric rotary converter, a three-phase, self-cooling-type transformer, with complete automatic control equipment for the machine. There are four feeder panels.

The lighting is controlled by an automatic time switch, by means of which the exterior of the substation is illuminated from sundown to 2 o'clock in the morning.

The floor plan of this substation is 42 ft. x 44½ ft. inside measurement, and the ceiling is 20 ft. above the floor at the lowest point, the roof being flat and sloped to drain in one direction. The foundations are of concrete, extra heavy as a part of the noiseproof design, and reinforced with old 60-lb. A.S.C.E rails. These rails were thoroughly cleaned to facilitate adhesion to the cement, were cut to lengths by the railway and delivered on the job free of cost to the contractor, who placed them in the concrete.

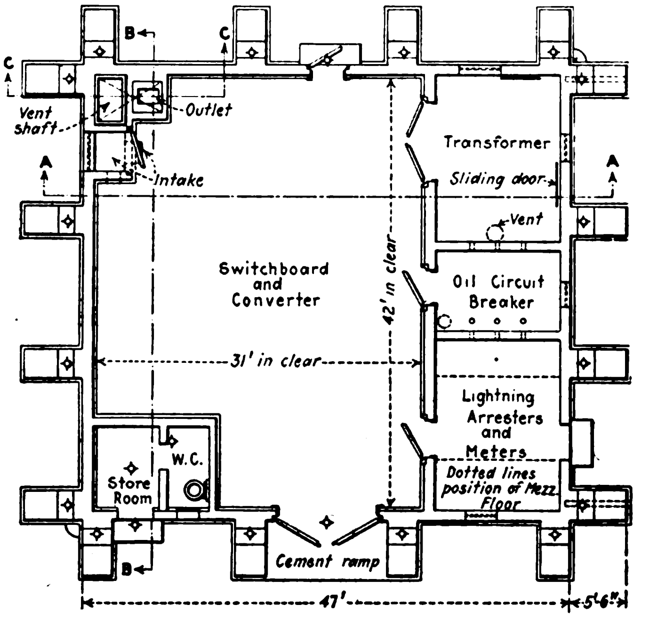
All walls, exterior and interior, are of well-burned common brick, 13 in. thick and laid in cement mortar. The upper portion of the exterior walls is made of reinforced concrete, to act as a bond to tie the building together and to facilitate the placing of tile and anchors where required.

Inside the walls, ½-in. "Flaxlinum" was placed be-



Cross-Sections of Garvanza Substation, Showing Noiseproofing Construction of Walls and Roof tween two thicknesses of building paper. Next to this, 4-in. x 12.-in. x 12-in. well-burned hollow building tiles were laid up in lime and cement mortar and secured to the brick walls by 60d. spikes over each third tile, the spikes being bent down to the tile.

The roof, of concrete reinforced with square twisted bars, is carried on steel girders and beams. The roof slab is 4 in. thick. To insulate the roof against noise, the concrete was covered with "Flaxlinum" between paper and a layer of the 4-in. hollow tile. The roofing consists of two layers of 15-lb. roofing felt and a three-ply standard cap sheet, all mopped down. All flashings are of 18-oz. copper. Two 6-in. cast-iron down spouts, buried in the wall, drain the roof, overflows being provided to take care of excessive rain.



PLAN OF GARVANZA SUBSTATION, LOS ANGELES RAILWAY

The exterior walls have large buttresses laid up solidly of brick, and timbers 8 in. x 8 in. in size project out beyond the cornice line by way of ornament. The walls are coated with cement plaster, tinted a deep green color and applied with a circular sweep. The effect of this is highly pleasing.

There are no windows in the wall, but a number of blind windows, covered with heavy black grilles, were provided to break up the flatness of the wall and thus improve the appearance from the architectural standpoint. Each pilaster is ornamented by a large black iron lantern, especially designed for this substation.

To return to some of the noiseproofing details, attention is directed to the design of the doors.

The main door is 10 ft. x 14 ft. in size, and it is made in two pieces and located at the rear of the building. This door is for occasional use only and is large enough to permit the passage of any piece of machinery in the building. It is held in place by a specially designed beam, screwed into the door and braced against the jamb. A small door is provided in the front of the building for general use. Both doors are closed by means of icebox fasteners to permit them to be tightly closed.

To render the doors soundproof they are made of three thicknesses of tongue-and-grooved lumber, laid diagonally with "Flaxlinum" between. To give them the maximum strength they are framed into solid timber. The door frames are of heavy timber, well secured to the walls by long bolts built into the brickwork. The doors and jambs are beveled on all sides like refrigerator doors to permit them to be drawn absolutely tight.

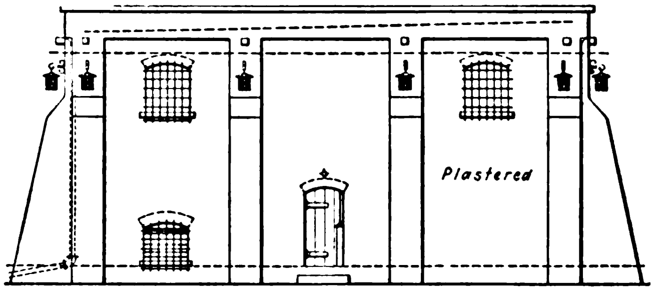
The air intake for ventilation was originally through metal louvers. These, however, caused a shrill whistling sound and they had to be boarded up. A hole of equal area was then cut in the roof and covered with a pent house, hidden behind the fire walls. Through this hole the air is drawn down through an intake shaft by means of a No. 6½ Sturtevant multivane fan, driven by a 2-hp. motor.

From the fan the air passes through a conduit in the floor to the base of the converter, after which it rises to the ceiling by convection and is drawn into the exhaust by a fan mounted on a suspended reinforced platform and similar in design and capacity to the intake fan. This second fan pulls the air into a duct running from the ceiling to the floor, which makes a 180-deg. bend at the floor line and passes up and out through the roof.

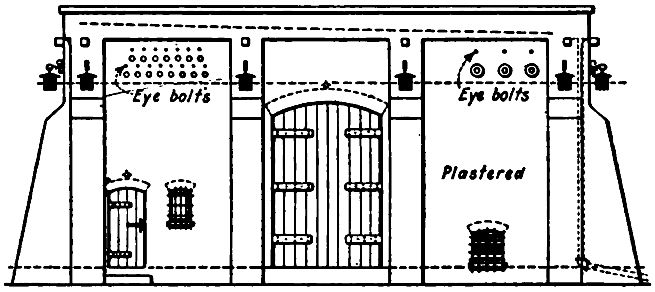
By the time the air has passed through this circuitous route, its noise-producing vibration has all been absorbed and it carries no noise from the rotary converter to the outside air.

As the outlet duct is open to the air so that some rain falls into it, the shaft is drained at the bottom by means of a galvanized iron pipe.

As shown in the plan of the building, the interior is divided into several rooms. The main room is to accommodate the rotary converter and switchboard, and there are separate rooms each for the transformer, the oil circuit breaker, and the lightning arresters and meters. Although there are no attendants regularly at the substation, a storage room is provided for supplies for the repair men and inspectors and a toilet room also.



Front Elevation



Rear Elevation

FRONT AND REAR ELEVATIONS OF GARVANZA SUBSTATION, SHOWING HEAVY BUTTRESSES AND DOOR OPENINGS

The building is placed on an ample ground area to provide for landscaping. An automatic sprinkling system has been installed to keep the lawns in condition.

All of the designs which have been described, the drawing of the plans and the supervision of the erection are the work of the engineering department of the Los Angeles Railway Corporation.

What Weekly Passes Do on a Zone-Fare Railway

Experience of the Beaver Valley Traction Company Shows Greater Traffic and Increased Revenue, More Particularly Due to Greater Off-Peak Riding by Companions of Passholders

BY WALTER JACKSON
Railway and Bus Fares Consultant

IT IS a far cry from London with its many millions to the Beaver Valley of Pennsylvania with its sparse thousands; from the operation of long underground trains almost every other minute to the one-man car service of a cross-country line; from the handling of a people who speak but two languages—English and Cockney—to that of a public whose tongues are of Babelian diversity. For all that, it would seem that a type of fare charging involving a wholesale rate for wholesale use can be successfully transplanted from the world's metropolis and readily adapted to the needs of an entirely different community.

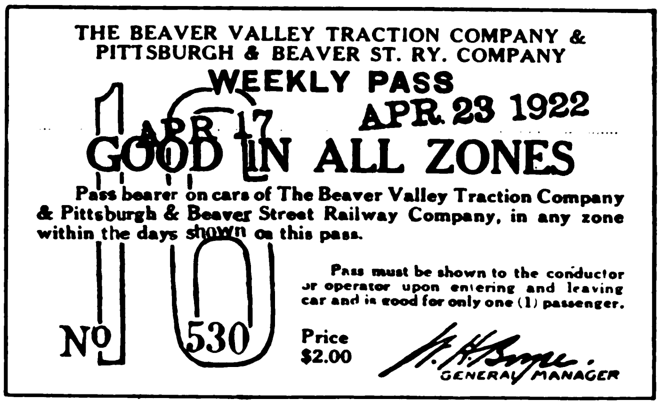
This type of fare is the unlimited-ride pass. In applying it to the Beaver Valley Traction Company, however, certain changes were made as follows: Period of validity cut from the London minimum of one month to one week; pass made good for bearer instead of using personal contract form; price, except for longest runs, set at the cost of between two and three rides a day instead of being generally less than that of two rides a day. The last change means that people riding in the one-zone and two-zone classifications must ride more than twice a day in order to secure a lower average cost per ride.

RESULTS BEFORE ADDING UNIVERSAL PASS

Since comprehensive articles on the layout of the Beaver Valley Traction Company have appeared in the April 22, 1922, and April 9, 1921, issues of the *Electric Railway Journal*, it will not be necessary to go into detail again. It is only well to remind the reader that the routes are cross-country lines serving small towns (the biggest 13,000) and thinly-populated, river-bluff country between; that the better-fixed element of the population is made up largely of commuters to Pittsburgh, and the less endowed classes are foreign-born people who work in local mills or factories; that the wives of commuters are tempted to shop in the big city via steam railroad, and that many local workers also use steam railroad commutation at very low rates. While there are no jitneys in the Beaver Valley, there are plenty of private automobiles run by companionable owners.

In the early days of the Beaver Valley Traction Company, 5-cent fare zones of 3 to 4 miles average length had obtained. With war times came 6-cent and 7-cent fares without change in length of zone. As this made serious inroads on the large proportion of short-haul riding, the company on Dec. 1, 1919, went back to a 5-cent base but cut the zones to an average of 2 miles. This shorter zone length, however, was still long enough to give nearly all town residents a 5-cent fare. As a result, the company revenues improved up to 23 per cent until the unemployment wave hit the valley a blow from which it is still suffering.

In this extremity, Mr. Boyce turned his thoughts to some plan that would cut fares for the wholesale rider without diminishing the actual revenue received from that rider—or possibly even securing more revenue through greater use of the service. The questionnaire mentioned in the April 22, 1922, article had revealed that people were only doing part of the riding they ought to, but that some bargain offer might put them on the cars oftener. Following an analysis made by the writer, the company put on a variety of weekly passes to take care of one-zone, two-zone and three-zone rides. The price for a one-zone pass was fixed at $0.85 or seventeen 5-cent rides a week; of a two-zone pass at $1.60 or sixteen 10-cent rides a week, and of a three-zone pass at $2 or thirteen and one-third rides a week. To these Mr. Boyce added a limited-hour special-distance school pass at 75 cents.



THE BEAVER VALLEY TRACTION COMPANY &
PITTSBURGH & BEAVER ST. RY. COMPANY
WEEKLY PASS
10
APR 17 APR. 23 1922
GOOD IN ALL ZONES
Pass bearer on cars of The Beaver Valley Traction Company & Pittsburgh & Beaver Street Railway Company, in any zone within the days shown on this pass.

Pass must be shown to the conductor or operator upon entering and leaving car and is good for only one (1) passenger.

No 530
Price
$2.00
GENERAL MANAGER

A UNIVERSAL PASS WAS PUT ON SALE IN APRIL FOR $2

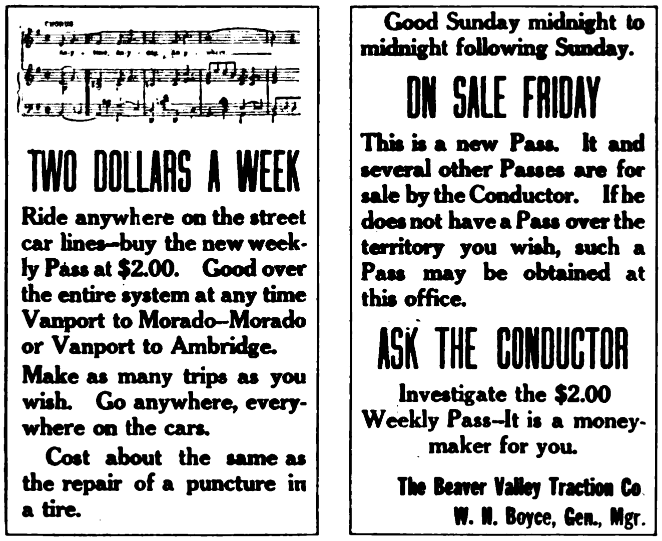
A zone or inter-station pass is, of course, not the same simple and flexible thing as a universal city pass. In the Beaver Valley there are long, desert stretches for which one would be lucky to get half a dozen steady riders a day, so that it would not pay to sell such combinations on the car. Another deterrent feature of an inter-station pass is that it may not cover both the rush and non-rush riding of the passholder. Thus, a man might travel westward to his work and eastward to his pleasure. If the pass did not cover all this at an attractive price, he would not buy one.

Because of the novelty of the pass idea, however, it was determined to go step by step rather than do everything at once. During the first week, beginning Feb. 13, 1922, nineteen fully printed varieties were sold to a total of 466 passholders in quantities from seventy down to one; in the following week twenty varieties totaling 476 were sold; in the third week, twenty varieties totaling 481, and in the fourth week, twenty varieties totaling 497. In the fifth week, eight unimportant passes were withdrawn without injury to gross revenues from passes.

From these first experiences, it was clear that certain passes need not be printed in full but could be rubber-stamped to cover date of issue and week of year at a considerable saving in printing expense. Another saving was obtained by selling the back of the pass for advertising by the local gas and electric company at a price which covers half the cost of production. The management also knows now what passes it is worth while to offer on the cars through the platform men and what passes, because of trifling sales, it should sell only at its offices. In short, the company is ready to make to order any combination desired, but it does not expect its men to have on hand those of the rarer kind.

For eight weeks the company studied the behavior of the one, two and three-zone passes without changing prices, but liberalizing conditions in some zones so that extensions, lap-overs, etc., were granted to bring the rider to destination without irritating him by seeking more money for a walking distance ride. This commonsense procedure made a hit with the patrons, as shown by the jump to 531 in the sixth week and 585 the seventh week with accompanying increases in revenue as shown in Table I.

Despite the restrictions inherent in any inter-station pass and despite the fact that many residents of the valley were either wholly or partially unemployed, the passes brought at once a gratifying increase in revenue. Thus, during the first four weeks, the increase was $420 a week or $60 a day compared with the average of four weeks just preceding the pass. This was equivalent to a gain of 4 per cent in gross with, of course, no addition to service because nearly all such extra business necessarily is off-peak. For that matter, the company can take a lot of new rush-hour business, too, in plenty of zones without being "rushed" as it were.



TWO DOLLARS A WEEK

Ride anywhere on the street car lines--buy the new weekly Pass at $2.00. Good over the entire system at any time Vanport to Morado--Morado or Vanport to Ambridge.

Make as many trips as you wish. Go anywhere, everywhere on the cars.

Cost about the same as the repair of a puncture in a tire.

Good Sunday midnight to midnight following Sunday.

ON SALE FRIDAY

This is a new Pass. It and several other Passes are for sale by the Conductor. If he does not have a Pass over the territory you wish, such a Pass may be obtained at this office.

ASK THE CONDUCTOR

Investigate the $2.00 Weekly Pass--It is a money-maker for you.

The Beaver Valley Traction Co
W. H. Boyce, Gen., Mgr.

Two Posters on the Universal Pass

This first gain in revenue was approximately 80 per cent of the then revenue from pass sales. It is not conceivable that it came wholly from the passholders' own riding. The two most likely causes were these: First, while the passholders took more off-peak or pleasure rides than before because they had no further fare to pay for themselves, they did have to pay full cash fares of 5, 10 or 15 cents each way for their companions—the more companion rides, the more fares; second, it is reasonable to suppose that the riding suggestions addressed to the passholder as "Go to the basketball game on your pass" would also tend to get some riding out of people who did not have passes. At any rate, more money came into the treasury and more people onto the cars, than which no better tests could be desired.

STILL BETTER RESULTS ON ADDING UNIVERSAL PASS

Owing to the great variety of passes that were required merely to take care of one to three zones, it was not desirable to go further at the start. The analysis of traffic had shown that not more than 6 per cent of the revenue came from rides in excess of three zones, because almost all the long-haul rides in the valley were being taken on the two steam railroads. The commutation rates were so low that it appeared unwise to make a direct attack on this kind of business, bearing in mind also that it was largely rush-hour travel in any case.

TABLE I—CHANGES IN EARNINGS FROM PASSES, SHOWING HIGHER RATE OF INCREASE FOLLOWING INTRODUCTION OF $2 UNIVERSAL PASS, WEEK BEGINNING APRIL 3, 1922. ALSO NUMBER OF PASSES AND AVERAGE RETURN PER PASS.

	Amount	Number of Passes	Average Return
No. 1, Feb. 13	$512.85	446	$1.15
No. 2, Feb. 20	552.00	476	1.16
No. 3, Feb. 27	564.00	481	1.17
No. 4, March 6	586.00	497	1.18
No. 5, March 13	570.95	485	1.18
No. 6, March 20	609.30	531	1.14
No. 7, March 27	655.55	585	1.12
No. 8, April 3	619.65	538	1.11
No. 9, April 10	798.75	598	1.33
No. 10, April 17	870.60	635	1.37
No. 11, April 24	978.20	695	1.41
No. 12, May 1	1,047.70	730	1.43
No. 13, May 8	1,109.50	769	1.44

However, some inroads are being made on the steam railroads indirectly through the universal pass which was introduced the ninth week, beginning April 10. Almost immediately after the inauguration of the inter-station passes, there had arisen a demand for a pass that would be good anywhere on the system. At first, a price of $3 to $4 a week was considered, but bearing in mind how little existing business was in excess of three zones, the management took the plunge by announcing that from April 10 onward the three-zone price of $2 would also be the price for any length of ride. The response was most gratifying from the start, pass sales rising from 538 to 598 and pass revenue from $619.65 to $798.75; by the week beginning May 8 (No. 13 of the pass) the passholders had risen to 769, and the revenue to $1,109.50 or more than double the first week.

The change in the distribution of passholders according to price paid is clearly set forth in Table II, comparing the first, seventh, ninth and thirteenth weeks. This shows in comparing the seventh (best pre-pass) and ninth (first universal pass) weeks that of the 133 new $2 riders, ninety seem to have come from the $0.85 class and twenty-eight from the old $1.60 class, thus raising the average return per pass from $1.11 to $1.33 a week. In the following weeks, the $2 universal continued to grow in favor so fast that by the thirteenth week there were 338 subscribers at that price, bringing the average return per pass to $1.44 a week.

TABLE II—CHANGE IN CHARACTER OF PASSES SOLD BEFORE AND AFTER INTRODUCING UNIVERSAL PASS, COMPARING FIRST WEEK WITH SEVENTH (BEST PRE-UNIVERSAL), NINTH (FIRST UNIVERSAL) AND THIRTEENTH WEEKS.

	First Week	Seventh Week	Ninth Week	Thirteenth Week
75 cents School	2	14	12	11
85 cents 1-zone	291	397	307	329
$1.60 2-zone	105	101	73	91
2.00 3-zone or more	48	73	206	338
	446	585	598	769

Up to the week of May 1, the universal pass could not affect steam railroad commuters because commutation is sold in this district from the first of the month. In that week, sixteen were added to the 280 of the week before. This does not look so promising, but it is likely that the electric railway started cutting into steam railroad off-peak revenue from the time it first put on the universal pass, especially in drawing messengers, commercial travelers and other off-peak riders who would find the universal pass exceptionally convenient. One must bear in mind that the commuter within the valley has to decide between these two conditions: A cheap and rapid ride to and from his job when time is precious, but with almost no use of the service at other times, versus a slower and costlier work-hour ride which can be made cheaper only by almost doubling the number of rides (though not the mileage) taken daily.

The likelihood is that as time goes on, the two, three and possibly four-zone steam railroad commuters will find the electric railway's universal service proposal the best in the end, particularly those whose homes or jobs are not conveniently close to the steam railroad stations. Furthermore, when 100 per cent employment conditions return, it may be feasible for the electric railway to run fewer-stop cars for these workmen and thus cut more deeply into this class of business.

It has already been stated that during the first four weeks the average increase in daily revenue was $60, compared with the four non-pass weeks preceding. By the end of the eighth week this daily gain had risen to $76.64. The introduction of the universal pass has improved this increase to approximately $125 a day, or about 9 per cent increase in gross revenue. As at the start, the increase in revenue is consistently equal to practically 80 per cent of pass revenues. Almost all of this increase is pure net, for no increase in service is required to handle the increase in traffic and the principal expenses in connection with the introduction of the system were covered by the gains of the first two or three weeks.

A gain of $125 a day is indicated by the first three weeks experience with the addition of the universal pass. The next week, beginning May 1, was abnormally low because a strike begun on May 2 on the Steubenville, East Liverpool & Beaver Valley Traction property put the Beaver Valley Traction Company's Route No. 2007 completely out of business to the tune of $75 a day local revenue and of $125 to $150 a day total revenue, the latter being due to the loss of through travel by Steubenville-East Liverpool transferees. Another loss of $25 a day is set down to the daylight saving plan which began on May 1. For the opposite reason, namely, pleasure business due to a circus at Junction Park, the extra good week beginning May 8 must also be cut out of the reckoning.

In any event, the twelve weeks period of the zone pass during a normal time compared with the preceding normal period of four weeks has convinced the management that the innovation has made good.

Additional Service Provided

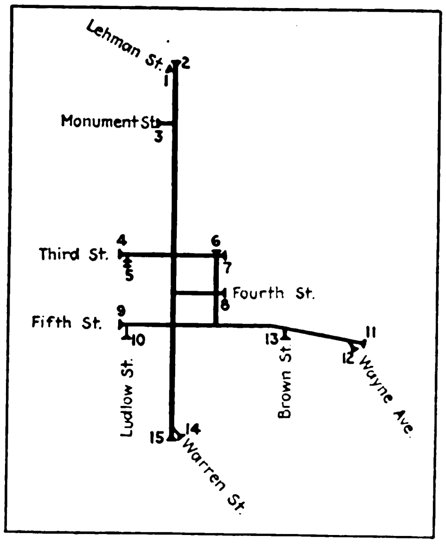
THE Erie Railroad, now operating a steam train service between Bradford, Pa., and Salamanca, N. Y., will shortly start a motor car service over this route, which connects at Salamanca with the main line of the Erie road. The length of the route to be covered is 17 miles. It is planned to install several cars, each seating forty passengers. The company also operates a large gasoline car.

Allocating Energy Consumption in Dayton

Energy Bills of Ten Electric Railways Operating Through the Central District of Dayton, Ohio, Based on Unit Consumption of Each Type of Cars as Determined by Metering the Energy Used

THE ten separate electric railways that operate over the same tracks in the central district of Dayton, Ohio, entered into a contract last year with the Dayton Power & Light Company for the purchase of all power used for the propulsion of the cars in that area. One of the local companies had formerly supplied the power for this area and had billed the other companies on a basis determined by a power survey made by the City Railway some six or seven years ago. Since that time many changes in operating conditions had taken place, so that the factors in use for determining the power used by each company were not accurate. Therefore, all the interested railways desired to arrive at new factors which could be used in computing more accurately their pro rata share of the total power bill.

The Economy Electric Devices Company, because of its extended experience and complete equipment to handle this work, was retained by a committee representing the ten interested companies to make a complete survey. This committee consisted of Henry Gebhart, general manager Oakwood Street Railway; T. E. Howell, general manager City Railway, and T. A. Ferneding, general manager of the Dayton, Springfield & Xenia Southern Railway.



MAP OF THE CENTRAL RAILWAY POWER DISTRICT IN DAYTON WITH ISOLATING CIRCUIT BREAKERS NUMBERED FOR PURPOSE OF THE STUDY

The purpose of the survey was to establish the normal energy consumption of each type of car operated over each route by the various companies. Having this information, it would then be possible to determine the total amount of energy used by each road from the number of trips through the central district and the unit consumption per trip of each type of equipment.

The energy consumption for each type of car was determined by placing suitable watt-hour meters on each car and taking readings each trip as the car entered and left the central power district. The accompanying map shows this central district and the position of the fifteen circuit breakers by which it is segregated from the remainder of the systems. The segregated district is fed by the Dayton Power & Light Company through one meter located in the power house. It is the total kilowatt-hours shown by this meter that is allocated monthly among the ten companies.

Following is a tabulation of the combination of routes and number of different types of equipment that were tested on each route for each of the ten railways:

	Name of Road	No. of Routes	No. of Types Of Cars
1	Oakwood Street Railway	1	6
2	People's Railway	3	6
3	Cincinnati & Dayton Traction Company	3	7
4	Dayton Street Railway	1	2
5	Dayton, Springfield & Xenia Southern Railway	1	6
6	Dayton, Covington & Piqua Traction Company	1	4
7	Dayton & Western Railway	7	5
8	City Railway	4	8
9	Dayton & Troy Electric Railway	7	3
10	Ohio Electric Railway	6	4
	Total	34	51

Thus the individual power consumption of fifty-one different types of cars had to be determined; in some cases for each type of car on but one route and in others for each type on as many as seven routes. Sufficient Sangamo railway type watt-hour meters were used to equip approximately one-third of the cars simultaneously. Readings on each group of metered cars were taken for every trip into and out of the central district for four successive days and the data obtained during this time were considered representative of the entire week.

Observers were stationed at the circuit breakers and were given individual written instructions to read the meters on specified cars passing in and out under their circuit breakers. These readings, together with the car number and the time, were noted on a printed form. At the end of each day's work each observer turned in his data sheets to the engineer in charge of the survey, who tabulated the figures. At the conclusion of the test all detail data were summarized by cars and routes for each company.

ENERGY CONSUMPTION DATA OF CARS OPERATING THROUGH CENTRAL DISTRICT, DAYTON, OHIO

	Class of Car	Number and Type of Motors	Weight of Car, Lb.	Single or Double Truck	Kw.-hr. per Car-Mile	Watt-hr. per Ton-Mile

All meters were calibrated before their installation on the cars and after being removed from the cars. No meter was found to have any appreciable error and hence no correction factor had to be used.

At the conclusion of both the first and second week's test, the period from Friday night until Monday night was used to transfer meters from the equipment on which tests had been completed to the next group of cars to be tested. All meters were so connected in circuit on the cars as to register only the energy consumed by the car motors and compressors. Tests on all cars equipped with electric heaters were made with a direct-current rotating standard after the conclusion of the power tests.

The figures for energy consumption per trip for any one car were very consistent, a result which is remarkable considering that the energy consumed per trip was very small, as low as 0.55 kw.-hr. The average energy consumption per trip for the different days of the week was also found to be consistent. A difference in the energy consumption of cars of similar types operating over the same line occurred at times. This may have been due to the difference in operation by the different motormen, or to varying conditions of equipment or to the use of unlike gear ratios. The variation between the operation by a good and poor motorman may be as high as 30 per cent. The condition of equipment may also account for a discrepancy in power consumption of from 20 to 30 per cent. Shorted fields, binding side bearings, nosing trucks, etc., have been found greatly to increase the power consumption of a car.

COMPARISON OF COMPUTED AND METERED VALUES OF THE ENERGY CONSUMED IN THE CENTRAL POWER DISTRICT, DAYTON, OHIO

	Kw.-hr. Computed from Car Schedules and Constants	Kw.-hr. at Switchboard Meter	Percentage Excess of Metered Over Computed Value
March, 1921	113,321*	165,200	45.78
April	161,745	181,900	12.46
May	168,836	184,100	9.04
June	168,030	178,500	6.24
July	117,602	131,900	12.16
August	151,317	153,133	1.20
September	142,617	148,900	4.41
October	151,437	166,900	10.21
November	168,801	178,600	5.81
December	174,941	205,825	17.75
January, 1922	168,079	201,700	20.00
February	149,625	177,000	18.30

* Based on old constants.

A comparison between the computed and metered energy values is given in an accompanying table. During the period from April, 1921, to February, 1922, the power house switchboard meter reading averaged 10.7 per cent higher than the computed consumption of all the cars in the joint-operation area. In this difference are included the distribution losses, the energy used for car lighting and by service equipment and heaters. It will be noticed that during the winter months the heating load has caused an abnormal discrepancy between the two values. When this additional use of current can be traced it is charged to the user, while the remainder is prorated among all ten companies.

While the determination for billing purposes of the energy consumption constants to apply to cars operating through the central district of Dayton was the definite purpose of this survey, some very interesting information was obtained as to the watt-hours per ton-mile for cars equipped with different types of motors. These figures, it must be remembered, cover operation in the downtown district where a stop is made at every corner and where speed is slow.

Rail Motor Buses Replace Interurban Cars

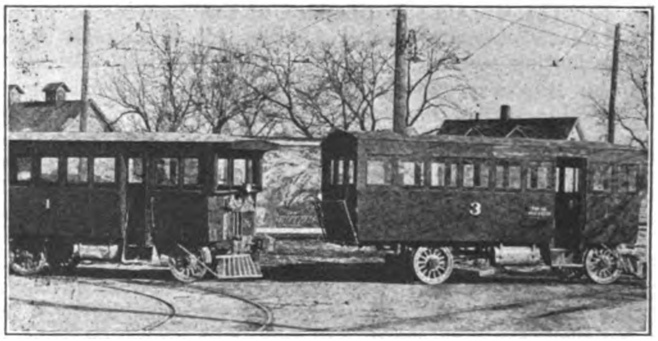
The Abandonment of Camp Funston in Kansas So Seriously Reduced Traffic that Electric Railway Operation Had to Be Discontinued—Some Details of the Buses Which Replaced the Cars

OPERATION of electric interurban cars on the Manhattan City and Interurban Railway, connecting Manhattan and Fort Riley, Kan., has been discontinued and four-wheel drive trucks substituted therefor. These trucks were purchased new from the factory and bodies seating thirty passengers built for this service. These are pictured herewith. Two of the rail buses are operated on the city line in Manhattan and two on the interurban line. In addition the company operates two buses of the same type equipped with pneumatic tires between Fort Riley and Junction City, which make connection with the rail buses.

The chassis for each car weighs 7,200 lb. Some of the other features of the cars are as follows: 156-in. wheelbase; high-speed reverse gears which enable the cars to go as fast in reverse as they will go forward; locomotive type "cow-catchers"; electric starting and lighting devices; heating systems which utilize the heat from the motor exhaust; entrance and exit near the front of the car, the door being operated by the driver.

The two cars operating on the city lines average about 95 miles each per day and 500 stops each per day, while the two cars in interurban service average 150 miles each per day and about 250 stops each.

Both in the city and on the interurban line between Manhattan and Junction City, there are many steep grades and sharp curves in the tracks. At one place the cars travel up a 5 per cent grade which is 2,500 ft. long and another 3½ per cent grade which is 4,000 ft. long. The curves encountered by these cars vary from less than 1 deg. up to a curve with only a 45-ft. radius.



RAIL MOTOR BUSES SUBSTITUTED FOR ELECTRIC CARS ON SHORT KANSAS LINE

Joseph T. West, president, explains briefly that the principal thing that caused the change in the plan of operation was the falling off of business on the interurban line after Camp Funston was abandoned. In addition, the cost of electrical energy was about 2.6 cents per kilowatt-hour measured on the alternating-current side, whereas the gasoline cost is just about one-third what the power bills were. Furthermore, the expense of keeping up three substations, the maintenance of the pole line and overhead construction are eliminated, as is also the salary of one engineer. Furthermore, the rail buses are operated with one man as against two on the interurban cars. Mr. West also comments that the cost of maintaining the trucks will not be as great as that of the electric cars displaced.

Since the pictures reproduced herewith were taken, steel spoke wheels have been installed to replace the wooden wheels shown, and this is said to be a great improvement. Later on, after further operating experience has been had and cost data accumulated, it is expected that a detailed article giving the operating comparison between electric and present equipment will be published herein.

The Automatic Substation for D. C. Railroad Distribution

This Is a Discussion on the Most Economical Size of Station and Equipment Where an Automatic Substation Is to Be Installed

A FEATURE of the annual convention of the American Institute of Electrical Engineers, held at Niagara Falls June 26 to 30, was a paper on "The Economics of Direct Current Railway Distribution, with Particular Reference to the Automatic Substation," by L. P. Crecelius and V. B. Phillips, consulting engineers, Cleveland, Ohio, and formerly connected with the Cleveland Railway. Their paper is given in full in the May issue of the *Journal* of the A. I. E. E., page 363.

In a preliminary statement the authors said that the comparatively recent development of the full automatic substation and also the automatic substation combined with remote control have served to reopen the entire subject of economics of distribution. The great fluctuations in the prices of materials and of labor have also made necessary a renewed study of this subject. As the proper design of a distribution system should represent the balance among all of the different items of cost that go to make up the total cost of power, any change in the relative costs of materials as against labor or of a certain class of material as against another class of materials tends to upset such a balance.

The Niagara Falls paper was prepared to determine, first, the relations that govern the size of feeders and the correct feeder layout for any given arrangement of substation, and, second, the principles underlying the correct location, size and type of substations, assuming the fullest development of automatic and semi-automatic control. There is involved also the question of stray current, the minimizing of which is certainly to be desired by electric railways. The most effective method of accomplishing this is to increase the number of distributing points. If a large number of distributing points is justified from an economic standpoint and an operating standpoint the problem of electrolysis may perhaps cease to exist.

The cost of distribution in large cities the size of Cleveland, Detroit or St. Louis, comprising the carrying charges on the feeder, the heating losses in the feeder and the carrying charges on the equipment necessary to supply these losses, is considerably in excess of $250,000 per year. It is apparent that a careful study of this item, of course, will more than likely be justified by the savings that will result.

There are not at present sufficient accurate data on cost and performance of automatic substation to make possible a precise analysis of specific cases. In lieu of this, the authors of this paper endeavor to show limiting conditions and by example to illustrate the relation of the various determining factors to the final cost.

As the paper is available in the A. I. E. E. *Journal* and in reprints available through the Institute office, it will not be abstracted here. However, the conclusions of the authors may be briefly stated as follows:

(a) The economically proper size of feeder where, as in cities, distributing distances are at most 3 or 4 miles, is such that the maximum voltage drops are too small ever to interfere with proper operation of cars.

(b) The economic justification of the automatic substation is a reduction in distribution costs.

(c) In a city district in which there are wide fluctuations in loads and in which full automatic control is used, so that machines are started and stopped entirely by line voltage and load conditions, the average efficiency of the substation over a period of time may be reduced by as much as 5 per cent largely because of the frequent starting and stopping of machines. It is believed that in large cities it will prove necessary to adopt some form of remote control in conjunction with automatic control.

(d) The principal limitations in the reduction of substation sizes by means of automatic and remote control are: (1) investment, (2) substation losses, (3) substation maintenance.

(e) Inasmuch as even a small difference in substation maintenance costs may be the deciding factor in a comparison between two distribution layouts, the standardization of substation equipment, with the resultant economies, is a matter of importance.

DISCUSSION OF PAPER

After the presentation of the paper motion pictures were used to show in detail certain sequences of operation which were under discussion. In the following discussion D. W. Roper, Commonwealth Edison Company, Chicago, urged the railways, in their present position of financial ability, to rehabilitate and catch up with the times. He advocated, among other things, a plan to use as many automatic substations, with the many resulting closely located feeding points, as possible, in order to reduce electrolysis as well as to increase economy.

W. E. Bryan, superintendent of power United Railways of St. Louis, read a carefully prepared discussion of the paper. He said that the automatic substation has interjected an important element into the field of electric railways, and engineers in this field must be prepared to take full advantage of the new developments, involving some readjustment of previous ideas as to size of station, type of buildings, etc. Variation in local conditions, he said, makes general conclusions applicable to cities of a given size both difficult of determination and of doubtful value. A solution applicable to one locality may not be the best solution for another, because of large differences in the cost of land, availability of conduits, etc.

Another point is power supply. In St. Louis, for instance, the railway receives its power from three sources. It purchases water power at 55 per cent load factor and steam power at 40 per cent load factor, while it generates power in its own plant at 14 per cent load factor. There are several direct-current feeders of admittedly poor design from a distribution standpoint which, nevertheless, considering the different costs of the several sources of power, provide the best arrangement from an economic standpoint.

Referring to the cost of distribution mentioned in the paper, Mr. Bryan stated that in St. Louis the annual cost of distribution is $425,000. The larger the distribution cost, the greater the possible saving which can be effected by the use of an increased number of substations. In other words, if, as the authors conclude, stations of 3,000-kw. capacity are best adapted for cities where the annual distribution loss is $250,000 per year, it seems logical that if the distribution loss is considerably in excess of this figure a greater number of stations, and therefore stations of smaller capacity, are justified.

Of the factors entering into distribution costs, the most important is that of fixed charges on investment necessary to supply peak load losses. If automatic substations, especially in congested districts, are properly adjusted as to voltage, a very material saving in this item will result, due to the saving in distribution losses.

In connection with the layout of substations, the railway engineer is usually confronted with the necessity for taking care of a given district, and the question is whether it shall be fed by one, two or perhaps four stations. In this connection it may be of interest to note that a comparison of a 2,000-kw., two-unit station and two 1,000-kw. stations for St. Louis resulted in showing investment costs of $38.25 per kilowatt for the former and $39.75 for the latter. The cost of the control equipment for the two-unit substation is slightly higher than the cost for two single-unit stations, due to the necessary additional control devices. This difference is more than offset, however, by the increased cost of land and buildings for the single-unit stations. The maximum advantage of automatic stations can only be obtained where land and building costs are held to a minimum. Automatic equipment lends itself to simple and inexpensive types of building.

Referring to the lower efficiency which the authors of the paper state is to be expected with automatic substations, making some kind of remote control advisable, Mr. Bryan said that this conclusion is evidently based on the efficiency curves of a 60-cycle converter, which constitutes a minor portion of those in use on railway systems. The situation is different with the 25-cycle converter. In St. Louis the five new automatic substations recently purchased are laid out to carry approximately 125 per cent of rating for the maximum half hour, which would result in an average load of about two-thirds of rating. The relays will be set so that the station will run practically continuously for sixteen to eighteen hours per day, the slight loss in station efficiency at the lighter loads being more than offset by the saving in distribution losses. The stations and feeders are so designed that if one station is out of service the overload on adjacent stations would not reach the danger point, nor will the distribution voltage be seriously affected by the redistribution of current.

As to the authors' conclusions that in cities such as Cleveland it is doubtful if the capacity of substations can be profitably reduced below 3,000 kw., Mr. Bryan cited the following: In St. Louis it was desired to reduce the load on a 4,000-kw. substation feeding principally the heart of the downtown section. It was decided to move two 2,000-kw. interpole rotaries from their locations in existing stations into the downtown district fed by the 12,000-kw. station. Three alternatives for the use of this equipment presented themselves: (1) A single 4,000-kw. station manually operated; (2) a single 4,000-kw. station automatically operated; (3) two 2,000-kw. stations automatically operated, spaced approximately 4,500 ft. apart. The following figures represent the annual cost, based on the investment necessary for additional equipment, land, buildings, transmission cables, distribution cables, together with allowances for distribution losses:

4,000-kw. station manually operated	$14,250
4,000-kw. station automatically operated	13,800
Two 2,000-kw. station automatically operated	13,000

The last named arrangement was decided upon, and Mr. Bryan felt that for cities similar to St. Louis the 3,000-kw. station is not the minimum size justifiable. Furthermore, if automatic substations of 2,000-kw. capacity can be justified in a congested downtown district where the feeding distances are comparatively short, in districts outside the downtown areas, where conditions more nearly approach interurban, the automatic substation of, say, 1,000-kw. capacity finds a useful field.

It is not contended that in areas like the loop district of Chicago, where concentration of load is extremely heavy, the automatically controlled equipment will be found advisable.

Taking up the last conclusion of the authors (e), Mr. Bryan said that this is open to the objection that if units of one size are used exclusively, the maximum distribution economies cannot be obtained. It would seem that for a city the size of St. Louis 1,000-kw. units would be best for general use, with 2,000-kw. units for the downtown districts and other points of heavy load concentration and, say, 500-kw. units for use at outlying points and on interurban lines. Such a plan would not materially increase the necessary stock of spare parts, since many items of the control equipment are the same for various sizes of units.

Standard control layout has material advantages, but it has also commercial disadvantages. Changes of a more or less radical nature are bound to occur also in automatic control equipment as the art develops.

C. E. R. A. Has New Experience

Summer Convention on Board Ship Beset with Navigation Delays but Cruise Greatly Enjoyed Nevertheless—Manufacturers Have Their Inning in Business Sessions with Papers on the Motor Bus, Energy-Saving Devices, Bearing Metals, Gears, Light-Weight Cars and Ventilation—Papers Also on Weekly Pass and Freight Development

CONTRARY to the precedents furnished by all previous boat trips of the Central Electric Railway Association, the six-day cruise on Lakes Michigan, Huron and Erie last week was given new variety by a brief experience each with rough seas, cold winds and rain, fog and a sand bar. A missing buoy light in Lake Erie was responsible for the *S.S. South American* getting off the course and on a sand bar. Having feared he was off the course, the captain had slowed down so that the ship was barely moving when it went aground and no damage was done. Nevertheless, all manner of maneuvering failed to free the ship, a curious circumstance being that from 19 to 24 ft. of water was sounded all around the boat, which draws only 15 ft. Apparently the boat was grounded amidships on a high shoal or other obstruction in the channel. After being stuck fast in this position for about six hours the boat floated off with the shifting of the wind to an easterly direction, which raised the level of the water.

Another delay of about four hours was caused by a dense fog, which settled down while the *South American* was passing north through the St. Clair flats. All ships had to drop anchor until the fog lifted on account of the very heavy tonnage that navigates this narrow and winding course. The combined delays made it necessary to omit the stops planned at Charlevoix and Traverse City, Mich. But despite the several unscheduled events, the cruise was a happy party as usual, and everyone seemed to enjoy the trip and associations, the meetings and the entertainments.

As usual, much of the entertainment during the cruise was furnished by talent in the party under the direction of the committee on arrangements, James H. Drew, president Drew Electric & Manufacturing Company, Cleveland, Ohio, giving particular attention to this feature. A unique attraction was a "1952" meeting of the C.E.R.A. enacted by the Rotarians on board, in charge of John C. Schade, general manager Winona Interurban Railway, Warsaw, Ind. The committee reports read at this entertainment indicated phenomenal developments in the transportation world during the thirty-year interval which had elapsed since 1922.

Dancing on the sun deck was a popular feature of the entertainment. The "Central Daily Spray," published by *Electric Railway Journal* and delivered at the breakfast table each morning, recorded the lighter happenings and "scandals" of the care-free party. It was a much appreciated part of the general merriment.

The technical sessions were held in the saloon of the boat and were well attended. Abstracts of most of the papers presented are published in this issue. Others will be printed next week. An account of the meetings follows:

AN ANCIENT BUS LAW IN OHIO

Following the presentation of the paper on "Auto Transportation" by Zenas W. Carter, White Company, T. A. Ferneding, general manager Dayton, Springfield & Xenia Southern Railway, Dayton, Ohio, said that his company is experiencing severe and destructive competition from a bus paralleling its interurban route between Dayton and Xenia. The motor company is running three high-class buses, which are able to make the run in ten minutes less time than the interurbans. An annual tax of $24 per vehicle is all the bus operator is required to pay. Recently an old statute has been found which states that a bus line operating in competition with an electric railway can be ordered by the commission to cease running provided its service is being conducted at a loss to the operator. A check of the number of passengers riding in the buses indicated that in spite of the low taxes the business was not showing a profit. On this basis the commission has been petitioned by the railway to have the bus company submit its figures and show whether or not operation is being conducted in a profitable and commercial way. If the operating figures submitted to and approved by the commission show a deficit it will have to refuse permission for the buses to furnish its competitive transportation service.

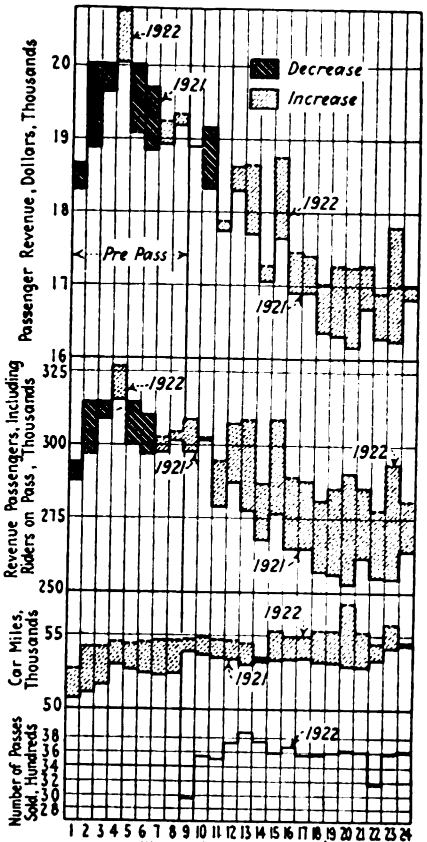


CHART SHOWING EFFECT OF WEEKLY PASS ON FORT WAYNE (IND.) CITY LINES

THE WEEKLY PASS IN FORT WAYNE

In presenting the results of the weekly, unlimited-ride, transferable pass, S. W. Greenland, vice-president and general manager Indiana Service Corporation, Fort Wayne, Ind., said that the plan was introduced with the week beginning Feb. 27, 1922, when 2,967 passes were sold. The company has the second highest fare in the state of Indiana, namely, 7-cent cash and a 6¼-cent ticket rate, and 90 per cent of the passengers used the lower ticket rate.

That the pass worked out on the city lines of Fort Wayne as it has in other places is shown by the accompanying chart of weekly earnings and riding. It will be noticed that although the weekly earnings were consistently lower for the first two months of 1922 than for the corresponding period last year, almost every week has shown an increase since the passes were put on sale. An analysis of the figures shows that a 2 per cent decrease in riding has been converted into nearly a 9 per cent increase with but slightly more car-miles. The number of revenue passengers includes those riding on passes, the assumption being that pass holders take twenty rides per week.

Even if the number of car-miles had to be increased slightly, Mr. Greenland said the pass is an excellent fare scheme provided the extra seats furnished do not cut down the net below the earning requirements. It is a real merchandising idea that has appealed to the public and has helped both the people and the company by largely eliminating the fare collection transaction.

Because of this feature alone the pass has speeded loading and done away with the argument between the conductor and riders who try to present worthless transfers. Mr. Greenland also brought out the point that the pass is such an attractive proposition to automobile owners who are required, on driving into town, to park their cars four or five blocks from their place of business that many of them now prefer to take the street cars. As the downtown business centers of our cities become more congested, this is a class of riders who will be regained.

There are many interesting and humorous sidelights in the way a few people will attempt to beat the game. While there is only "one in every office," there are many varieties in every town. For instance, each pass is punched as it is sold because clerks in the stores where the passes were on sale acquired the habit of using them and then returning them to the company at the end of the week. Others consider a pass as an investment which can earn a reasonable return besides amortizing itself when rented for 5 cents a ride. On the other hand it was reported that one gentlemen was too wise to kill the goose that laid the golden egg. The pass system, in his estimation, was too good to last and consequently he did his bit to make it last by paying cash fares for all rides over twenty.

In the connection of abuses of the pass, J. B. Stewart, Jr., general manager Youngstown (Ohio) Municipal Railway, remarked that the practice of making "two passes grow where one grew before" became prevalent enough with the heavy pasteboard type of pass that could be split that his company is now using thin protectograph paper. By having the printing done out of town there was less danger that the printer would sell a few "over-runs" at a reduced price. Because of numerous complaints that the new thin paper passes were too frail, a pocket case with a celluloid face is given away with every pass. The back of these cases carried the advertisement of a local bank, which bore the total cost of their production. The popularity of the pass holder was such that during the first week they were distributed the sale of the passes themselves showed almost a 10 per cent increase over the sales of the previous week.

Mr. Stewart also showed samples of the advertising copy which has been used in the Youngstown newspapers and for car cards. Some typical specimens of the "personified pass" copy appeared on page 13 of the issue of this paper for July 1, together with facts that show how worth-while and effective this publicity has been. Mr. Stewart said that now 30 per cent of the company's revenue comes from pass riders who comprise 44 per cent of the total passengers. The Youngstown Municipal Railway registers the number of rides taken by pass holders.

DEVELOPMENT OF FREIGHT

After the reading of Bert Weedon's paper on the Development of Interurban Freight, Harry Reid, president Interstate Public Service Company, Indianapolis, Ind., called attention to the fact that the faith in the future of the electric freight business, which was the prevailing note of Mr. Weedon's talk, was based on a successful campaign and therefore should carry a great deal of weight. Mr. Reid said that when Mr. Weedon undertook to increase the percentage of the Interstate Public Service Company's revenue from freight haulage six years ago, the earnings from this source were 6 per cent of the gross and that now under his régime they have been increased to 45 per cent.

WHAT A KNOWLEDGE OF ENERGY CONSUMPTION OPENS UP

Even though Mr. Miller's paper on energy saving devices contained the results of seven properties using the Economy meter on their cars, Harry Nicholl, general manager Union Traction Company of Indiana, Anderson, Ind., told of several very important operating economies that none of the others had reported. One of the more important of these was that accurate data on the kilowatt-hour consumption per car mile had enabled the operating department to redistribute the various types of equipment according to the kind of service and the characteristics of the route and power supply. In other words, for a given set of route, traffic and power conditions a car with a certain size of motor and a certain gear ratio will be the most economical to operate. Likewise this information has been used to determine the actual cost of power used by freight motor cars with different numbers of trailers. In regard to the over all saving which the meters have largely made possible, Mr. Nicholl said that a 14 per cent reduction in the amount of coal consumed had been effected. Besides, a very marked reduction in the cost of maintenance of electrical equipment had resulted both because of the better treatment the cars had received and on account of the inspection of rolling stock on the dial inspection basis, a system that is well liked by the maintenance department. Another important point Mr. Nicholl mentioned was that there had been absolutely no increase in the number of accidents even though the motormen must give additional attention to the economical handling of their cars. The advantages mentioned are based on over two years operation with meters installed on about 130 cars. Mr. Nicholl added that complaints had ceased about loose brakes and frequently it is difficult to adjust them loose enough to suit the men.

FRARY BEARINGS ON LEXINGTON CARS

The only discussion on H. H. Buckman's paper on "Car Bearings" was that offered by W. G. Stuck, master mechanic Kentucky Traction & Terminal Company, Lexington, Ky., who said that Frary metal motor, axle and journal bearings are being used on all ten of the company's new 25,000-lb. interurban cars. No hot boxes of any sort have occurred since the cars were placed in operation during the latter part of February, 1922. Each car, which is operated 7,200 miles per month, is lubricated every forty-five days. For May the cost of lubrication was 3.41 cents per 1,000 car-miles. The journals of these light-weight cars are fitted with 3½ x 6-in. bearings, which have a rubbing speed of 221 ft. per minute for the schedule speed of 20.8 m.p.h.

NEW PINION SAVES SCRAPPING OF GEARS

In addition to the able paper on new tooth shapes for pinions, E. S. Sawtelle, assistant general manager Tool Steel Gear & Pinion Company, Cincinnati, Ohio, mentioned the results that are being obtained by several railways with the new "wisdom" tooth pinion recently brought out by his company. In answer to a questionnaire, one property claims that for the short time the new type of pinion has been in service it has shown slightly less wear than the regular long addendum design. Even though one tooth has been dropped from the wisdom pinion to obtain the heavier base, the slight increase in the gear ratio has not affected the schedule speed. However, in another case of a motor car pulling a trailer, the increase in tractive effort was noticeable. A good instance of the possibilities of this new type of pinion, Mr. Sawtelle said, was how its advent had prevented one electric railway from scrapping $14,000 worth of new 14½-deg. tooth gears because of excessive pinion breakage. It was the intention of that company to re-equip all motors and axles with gears and pinions having the long and short addendum tooth. However, by the mating of all the gears already in stock with the heavy-base wisdom tooth pinion, the change to a new type of gearing has been avoided and the gears in stock can be worn out instead of thrown out.

A representative of the R. D. Nuttall Company was inclined to disagree with Mr. Sawtelle on the point that the change in speed from employing a higher gear ratio was not a rather serious drawback to the wisdom tooth pinion. He claimed also that an undesirable condition has been established by dropping one tooth from the pinion because its addendum is increased and that of the gear shortened with the effect that the point of contact is moved away from the zone of pure rolling contact.

W. G. Carey, General Electric Company, claimed that by concentrating the stretch during shrinking of a pinion having a lesser number of narrower spaces than the long addendum pinion, a danger of exceeding the strength of the material has been introduced and breakage would result.

DISCUSSION ON LIGHT-WEIGHT CARS

Commenting on F. E. Wynne's paper about light-weight interurban cars, J. C. Thirlwall, General Electric Company, presented figures by which he showed that a saving of $8,000 per car could be effected with the replacement of heavy interurban equipment with modern light-weight rolling-stock weighing about 60,000 lb. Mr. Thirlwall took present investment figures and operating costs from the statistics compiled for seventy-seven interurban lines by the American Electric Railway Association. The allocation of the possible savings per car as given were as follows:

Ties	$1,300
Tamping, etc.	500
Feeder copper	800
Substation	700
Power house	2,000
Car	3,000
	$8,300

What the light-weight car has done for the Kentucky Traction Terminal Company was told by W. G. Stuck, who said that the revenue of the interurban lines of that company had increased 12 per cent and the riding 30 per cent since the introduction of the more attractive and lighter equipment. The successful outcome in Lexington shows how perfectly possible it is for the public to be pleased with better and more frequent service while the company is enjoying a larger income and decreased operating expenses.

ENGINEERING COUNCIL DIRECTORS REPORT

Each of the sections of the Engineering Council, except the southern section, has held two meetings since the council was organized in the summer of 1921. The reports of the directors of the eastern, northern and western sections indicate that the formation and organization of the council was a wise move. In his remarks on the activities of the eastern section, Mr. See points out that most engineers are too busy following the endless details of their own property to have time for visiting and following the developments of other roads. It was to enable the operators to broaden their scope and learn the latest practices in the industry that the council was formed and in this direction it is attaining success. E. B. Gunn, chairman of the northern section, feels that one of the best features of the Engineering Council is that every man present knows that he has the freedom of expressing his ideas in his every day language. In regard to the attendance at the meetings, both Mr. Gunn and Mr. Schlesinger believe that the officials of the companies can give still further co-operation by making it easier for their men to be present.

A. Schlesinger, chairman of the western section, then outlined the proposals that were made at a meeting of the directors of the Engineering Council some time ago. The council is to undertake the preparation of certain standards useful to the association, and a plan is now under consideration to study existing specifications adopted or recommended by the American Electric Railway Engineering Association. It is the intention that committees be appointed by each of the four councils and after a thorough study of the various specifications, recommend to the Central Electric Railway Association through the Engineering Council the adoption of such standards and specifications as in their judgment are satisfactory. Any suggestions will, of course, be referred to the proper committees of the American Association for their consideration.

SECRETARY'S REPORT AND BUSINESS SESSION

Secretary L. E. Earlywine submitted his report, in which he commented on the various activities of the association. The traffic association has held three meetings since the beginning of the year and during that time thirty-seven excursion tariffs have been issued, making a total of sixty tariffs issued during the past year. The application to compile a master tariff to cover excursion movements was declined by the Interstate Commerce Commission. The traffic association has authorized the reissuing of the present storage tariff to conform to the rules and charges in effect on the steam railroads and the issuing of a supplement to the baggage tariff correcting transfer charges. The committee on prevention of freight claims is compiling monthly statements from member companies of loss and damage claims. The committee on the official interurban map has been authorized to revise the map plates.

The Accountants' Association has adopted a uniform interline waybill, which has been put into practice by a number of member companies.

A special committee appointed by the president consisting of A. Schlesinger and C. L. Henry has been conducting extensive work concerning rules and principles for safety and inductive co-ordination and has appeared on three occasions before the Public Service Commission of Indiana.

At the final meeting of the association on Friday morning resolutions on the death of George L. Radcliffe and Walter Hinman were passed, also one thanking the Chicago, Duluth & Georgian Bay Transit Company for the excellent service provided on the cruise.

The executive committee made a tentative suggestion that the annual meeting in January be held in Louisville.

Metals for Car and Power House Bearings*

Some of the Essential Characteristics of a Satisfactory Bearing Metal Are Given and the Advantages of Using a Lead Base Metal Are Discussed

BY H. H. BUCKMAN
Special Railway Representative United Lead Company,
Frary Metal Division

I FIND that nearly 64 per cent of equipment failures, causing train delays and annulments, are due to bearing failures. What portion of the bearing failures are due to lubricant failure I have been unable to ascertain. Fighting hot boxes with oil instead of analyzing the cause of the hot box runs up the lubrication cost of railroad operation, and high lubrication costs are found on railroads most troubled with hot boxes.

It is somewhat surprising to know the number of railways that purchase their bearings without knowing the nature or metal contents of them. Price seems to be the governing factor. I do not know of a more important subject than this for close co-operation between a purchasing agent and the master mechanic or superintendent of equipment.

Engineers, chemists and metallurgists have always endeavored to incorporate as high a percentage of lead as possible in babbitt metals, thereby increasing its anti-frictional qualities and at the same time lowering the cost. As the matter stands today, users of babbitt metal seem divided as to a standard formula as between a tin base or a lead base alloy.

The American Society for Testing Materials made an attempt to settle this subject by tabulating several alloys of lead base and tin base metals, but I feel safe in saying that bearing metals are as numerous and varied today as ever before and the consumer is still meeting his individual requirements by actual service tests. This is not as easy as those unfamiliar with bearing problems would suppose.

In the first place, the operator must determine the following factors: Tensile strength, compression strength, hardness, melting point, specific gravity, elongation and, most important, select a metal with the highest anti-frictional quality. It would be an endless task to try out by actual service tests all the different makes and grades of bearing metals, so before conducting service tests, the consumer carefully tabulates from his own laboratory tests the necessary qualifications to meet his requirements, or has these tests conducted by a local metallurgist or he secures this information from the manufacturer, except one and the most important point, the coefficient of friction. This he cannot secure from any one and he is compelled to draw his own conclusions because no machine has as yet been perfected that will give accurately the coefficient of friction under all conditions. So much depends upon actual conditions that figures thus far obtained are of little value. These conditions may be variation in load, in speed, in lubrication, and figures obtained on one test cannot be applied to another.

There are two specific services to be borne in mind when selecting bearings —one is heavy pressure at slow speed, the other is light pressure at high speed. Primarily, the object of a bearing is to reduce friction as much as possible, to prevent as far as possible wear on the shafts and axles and to provide quick means at as low cost as possible for taking up lost motion due to wear. Practically, the same mate-

---

*Abstract of paper presented before the Central Electric Railway Association, June 25-30, on board *S.S. South American*.

rials are used in bearings today as were used in bearings in 1839 by Isaac Babbitt, showing very little improvement, and on first thought one would wonder how bearings have kept up with the wonderful progress in increased speed and weights. The answer is, better designed bearings and better methods of applying them, together with improvement in lubricants and methods in lubrication. Most credit I believe is due to the latter to meet the increased speeds and weights; for instance, we could not expect to operate at the increased speeds and weights of today with the same lubricants as were used in the time of Isaac Babbitt in 1839, which were principally tallow grease.

The improvement in lubricants has been such that it is possible to use a bearing that has no anti-frictional qualities at all and little trouble would be experienced from hot boxes in certain light service. The writer recently visited a railway that uses cast iron motor and journal bearings without lining or even tinning. It simply machines, polishes and places in service. It experiences very few hot bearings, which proves that a bearing of no anti-frictional qualities at all can be operated in some instances without running hot. It also shows that one may operate with a very poor grade of bearings without hot boxes, but while he is escaping trouble in hot boxes he most certainly is encountering trouble of a more serious nature, but not so readily noticed in the form of high operating costs, due to excess lubrication, fast wear of shafts and axles and high power consumption. Therefore, it is necessary to give the bearing subject more thought and attention than merely eliminating hot boxes.

ADVANTAGES OF LEAD

Lead, being a greasy, anti-frictional metal, naturally has the highest anti-frictional qualities, and the more lead used in a bearing metal the more valuable it becomes as an anti-frictional bearing. A skip of lubricants for a few seconds with a tin base metal will often permit the tin to seize the shaft, with damage resulting to both the bearing and the shaft. This is easily understood when a comparison is made of the melting temperatures. Genuine babbitt melts at 460 deg. F. and lead at 621 deg. F. Complete liquefaction point of genuine babbitt is 683 deg. F., while that of lead is 800 deg. F.

The question is frequently advanced as to why a relined bearing does not last as long as the original lining. The answer is that it is due to poor bonding. Very rarely is a bonding on a relined bearing more than 75 per cent efficient and it is very often as low as 30 per cent, the reason being that it is impossible to get a 100 per cent job of tinning on a used bearings due to the oil that remains in the brass; though the bearing be boiled, subjected to baking processes at high temperatures, pickled, etc., some oil is always present, which prevents perfect bonding, even though a good job of bonding is secured. Very often a lined bearing also fails because at elevated temperatures the tin in the bonding softens and undermines the lining.

KEEPING BEARINGS TIGHT

Keeping armature and motor axle bearings tight in the motor casings is extremely important and is often neglected. A loose bearing not only destroys itself but assists greatly in destroying the entire motor. A bearing that is loose in the casing produces faster wear on the inside of the bearing than a bearing which is kept tight. The dowel pin was never intended to do all the holding of a bearing; its purpose was that it should be a guide, and a clamping fit in the casing was intended to hold it. However, to keep bearings tight in a casing is easier said than done. Several methods are now used to eliminate the dowel pin trouble, one of the most promising methods being to cast extended side lugs on the lower half of the bearing and cutting or grinding out suitable recesses in the bearing caps, thereby allowing the extended side lugs to come in contact with the upper section of the motor, and which practically eliminates all chances of the bearing turning over or moving. This scheme can only be used where bearings are cast to size, eliminating machining.

When the flange of the journal wears back into the bearing it is a mistaken idea that it can be corrected by filling the recesses with babbitt at the time of relining the bearing. The babbitt takes care of it but a short time, in some cases only two or three days, where trail cars are pulled around short radius curves. This you can readily understand when you consider that some recent tests showed end thrusts on a 4¼ x 8-in. M.C.B. journal bearing amounting to more than 10,000 lb. at certain intervals.

Develop the Freight Business !*

Freight Haulage Holds Great Potentialities for Interurbans to Increase Revenue Provided Adequate Traffic Organizations Are Developed—Very Important to Know Actual Costs

By BERT WEEDON

Traffic Manager Interstate Public Service Company, Indianapolis, Ind.

THE development of interurban freight business is more important today than ever before. The shrinkage in passenger earnings, the most important element of our earning power, is a serious matter. Much of this loss in revenue will never be overcome by the increase in passenger traffic and we must look elsewhere for earnings to fill up this gap. A general survey of the situation will disclose the fact that the development of interurban freight haulage can and will more than offset this loss.

Due to the fact that many miles of electric railways were built as passenger carriers, and for many years have been operated as such without regard to the important feature of carrying freight, many have been led to believe there was no profit in freight haulage. Many honestly believe yet that carrying freight on electric railways is a necessary evil and that we tolerate it becuse the various commissions require us to.

How many know anything about our freight business except the gross figures? Do we know the cost per ton-mile of operation? Do we know the gross revenue per ton-mile? Do we know what our actual investment is in freight equipment, including freight stations, cars and other facilities? In other words, do we know our actual investment in all equipment used and useful in the freight department? In fact, have we given the subject the consideration to which it is entitled?

There may be a few isolated cases where this question can be answered in the affirmative, but in the majority of cases we must admit we have failed to develop this phase of the industry. How many of us realized as early as 1914 or 1915 that in time we must rely on our freight department for a much larger portion of our income? A general education campaign directed toward the public as well as toward our own organizations to demonstrate our ability to perform freight transportation service is absolutely necessary. Also a system of accounting must be devised so that we can determine accurately the cost of handling freight and the return therefrom. Essential also is an aggressive, vigorous traffic department that will carry on a continuous campaign of solicitation 365 days a year and twenty-four hours a day. In other words, go after this business and keep after it, and then keep after it some more. Next, a transportation department must be developed that will educate itself to that point where it can furnish a service pleasing to the public and one that will also be economical in cost.

In a general way, conditions in our territories are very much alike, although there are certain local conditions in the various localities that require special attention and special treatment, such as:

1. A close industrial survey of the various communities in which we operate.
2. Finding out the location of the industries relative to our rails, as well as the possibility of placing of industrial switches to insure carload business, which is the most important phase of freight hauling and the one in which there is perhaps the greatest net.
3. A careful survey of the rural com-

---

*Abstract of paper presented before the Central Electric Railway Association, June 25-30, on board *S. S. South American*.

munities, ascertaining their service needs and showing a general interest in the development of these communities.

4. A wideawake industrial department, which will assist civic organizations in locating industries on electric railway lines or where they can be reached with an industrial switch.

With all of this development under way, let us direct our attention to the motive power, box cars, flat cars, gondolas and freight houses, tracks and other necessary equipment. We must be in condition to handle the business offered. Many of us expect our traffic departments to develop business, and then we are embarrassed by having neither proper service nor the equipment with which to handle it. It must be remembered that in order to furnish proper service we must have a surplus of equipment to meet emergencies at all times. Shippers must be educated to the fact that we can handle promptly all business offered.

A comprehensive system of accounting by which we may determine accurately the cost of operation; close attention to the freight claim department, requiring systematic attention to overs, shorts and damages, and prompt adjustment of claims are all necessary to the proper handling of a successful freight department. Freight agents, freight trainmen, in fact all departments having direct or indirect contact with the freight department, should be called in regular meetings, held at stated periods, for discussion of the problems of this department.

Where will we find the money to finance all the necessary equipment? If the average business man goes to his bank to borrow money for financing a purchase of merchandise and the banker should say, "Mr. Merchant, what will this merchandise cost, and have you a ready market?" Mr. Merchant answers with the figure of cost, and an evasive answer as to the market, and is again asked by the banker: "What will this merchandise net you?" Mr. Merchant is unable to answer the question, as he has not kept operating costs in such manner as to be able to give his banker a definite answer. Will he get the loan?

Most of us are in very much this position. Put your freight business on a basis that you may determine definitely what it is doing and you will have no trouble in financing the necessary equipment to show a good return. The reason that there are still many who do not believe in freight business on electric railways is that no systematic development has been started that we might determine its possibilities. There are, however, a venturesome few who have developed their freight departments. They know a splendid return awaits the effort to render freight service that meets the shippers' approval. Co-ordination of traffic and transportation departments, with the co-operation of other departments, will do much to develop black figures on your balance sheets.

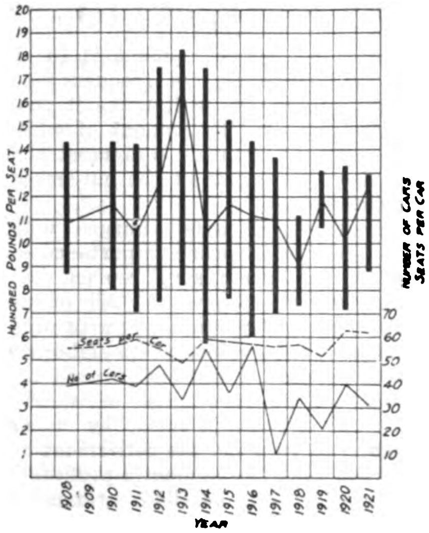
How Light-Weight Cars Improve Interurban Earnings*

Weight Analysis of Cars Is Given and the Savings that May Be Effected Are Detailed—Suggestions Made for Standardizing Designs of the Lighter Cars

By F. E. Wynne
Manager Railway Equipment Engineering
Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

NUMEROUS ways of improving the financial situation of the interurbans have been suggested, such as broader publicity, general ownership of railway securities in the communities served, special service for frequent travelers and large shippers, the intensive development of freight traffic, the installation of automatic substations and the more extensive operation of one-man cars.

Lighter weight cars may be used to secure improvement by any one or all of these means, but the maximum benefit in one direction is not necessarily coincident with securing the greatest all-round return. Such cars will decrease operating expenses directly per car-mile by reducing energy consumption, by decreasing the wear and tear on the track and by lowering the cost of maintenance, provided their design and construction are adequate. The greatest direct saving will accrue where the new cars are used to give only the same service as that previously given by the heavier cars. Usually this does not produce the greatest over-all improvement, for more frequent service is a major factor in improving public relations and in securing more revenue. This shorter headway means more car-miles, and part or all of the direct saving may be sacrificed in order to build up a greater income. The determination of the correct balance between saving and gaining is a nice problem for each railway to solve for itself.



DATA ON WEIGHTS OF INTERURBAN CARS DURING LAST FOURTEEN YEARS

In speaking of interurban cars, I have in mind those electric railways whose lines are of such length that two hours or more are required for the trip one way, with cars seating at least fifty passengers and with schedules requiring frequent or sustained speeds of 55 to 60 m.p.h. I am excluding the purely suburban and short, moderate-speed interurban lines where the 26,000 to 30,000-lb. double-truck car now available has an unquestioned field. Neither am I considering those electric railways which have to compete with the best in steam railroad service and which, consequently, must provide luxurious equipment and maintain exceedingly fast schedules for the attraction of an ultra-critical public.

With the generous assistance of the several manufacturers of cars, I have collected some information on weight, length and seating capacity of interurban cars more than 45 ft. in length over all as built during the years 1908 to 1921. These data furnish the basis for certain derived values shown in the accompanying chart. The weight per foot of over-all length was found to vary from 710 lb. to 1,570 lb., with an average of 1,185 lb. The weight per seat ranges fom 575 lb. to 1,825 lb. and the average is 1,147 lb. By years, the average car length and number of seats do not vary widely. For the nearly 500 cars considered, the average car is 55 ft. long, seats fifty-seven and weighs 65,000 lb. without equipment. The average equipment may be taken as four 125-hp. motors with multiple-unit remote control. This, together with air brakes, adds approximately 21,000 lb., bringing the total weight of car equipped to 86,000 lb., or the equivalent of 1,563 lb. per foot.

The standard safety car (16,000 lb. total) weighs 575 lb. per foot of length. Some of the light-weight double-truck cars recently built weigh 625 lb. per foot, fully equipped. Of course, we can hardly hope to secure such low weight for long-haul interurban service and, at the same time, provide the correct degree of safety and comfort at the high speeds required. However, the difference between 625 lb. per foot and 1,560 lb. per foot indicates that the latter figure is unnecessarily high. From conversations with the car builders, I believe they will not hesitate to undertake to build interurban cars 55 ft. over all to weigh approximately 65,000 lb. when completely equipped with multiple-unit remote control, air brakes and motors geared for a maximum operating speed of 55 to 60 m.p.h. For such a car, quadruple 100-hp. motors would be adequate. Assuming that this new car weighs 65,000 lb. to-

---

*Abstract of paper presented before Central Electric Railway Association, June 25-30, on board *S.S. South American.*

tal, the weight exclusive of electrical and air brake equipment will be approximately 47,000 lb., or 855 lb. per foot. This unit weight is 28 per cent less than the average of the 494 cars considered, and 70 per cent more than recent light-weight double-truck cars. It therefore appears that such a reduction in weight is not only possible, but is also conservative.

The use of such cars (65,000 lb. total weight) in place of 86,000-lb. cars will produce worth-while direct savings in:

(a) First cost of cars and equipment.

(b) Energy consumption.

(c) Maintenance.

(d) Line copper.

(e) Power-house and substation apparatus.

(f) Fixed charges.

The amount by which the cost of car body and trucks will be reduced is a question for the car builders to answer. The cost of a quadruple equipment of 100-hp. motors is in the neighborhood of $1,200 less than that of a quadruple 125-hp. equipment.

POWER SAVING IS CONSIDERABLE

The energy consumption may be roughly taken as proportional to the weight of loaded car, so that the reduction in the power bill will be in the neighborhood of 23 per cent. For the class of service being considered, the average energy required may be taken at 85 watt-hours per ton-mile at the power house. This is equivalent to a difference of 0.9 kw.-hr. per car-mile at the power house. At 1 cent per kw.-hr. and 50,000 car-miles per year, the energy cost will be reduced $450 per car annually. This alone will pay 6 per cent interest on a $7,500 investment.

The reduction in maintenance of cars and equipment is, of course, difficult to predict. For a 28 per cent reduction in car weight and a 20 per cent reduction in motor capacity, it seems fair to suggest a 10 per cent reduction in maintenance. There may also be a reduction in wear and tear on track, but this benefit may not be realized because it is entirely possible that better track may be an essential to the successful operation of lighter cars.

The direct benefit in the distribution system will be most apparent on entirely new roads and extensions. A 25 per cent reduction in weight will make a corresponding reduction in both the average and peak power requirements. With substation spacing fixed, this will reduce the feeder copper. With copper trolley wire costing 15 cents per pound and stranded copper feeder at 17 cents per pound, the saving in line copper by using the lighter car may be anywhere from $200 to $900 per mile of single-track route.

In certain cases where old equipment is replaced car for car with new light equipment, a similar return may be secured by taking down the excess feeder copper. However, before taking such a step, careful study should be given to the voltage conditions with the old cars because it may prove more economical to retain the full amount of feeder copper in service, thus securing improved line voltage conditions which tend to better the schedule speeds possible with a specific equipment, or to the operation of the same schedules with lower maximum speed and smaller motors.

On interurban lines the substation and power-house capacities are determined primarily by the peak loads. Where car for car replacement is made, lighter cars may relieve overloaded rotaries, transformers and generators. Under other conditions, they may make it possible to decrease the number of substation and power house units in operation during a considerable portion of each day, resulting in a better load factor, higher over-all efficiency and lower maintenance. On new lines and extensions the lower power requirements of lighter cars are reflected directly in smaller or fewer substation and power house units.

Where the new equipment is to be used for increasing the frequency of service, lighter cars will make it possible to minimize the amount of additional feeder, substation equipment and power house apparatus to be purchased and installed.

The saving in fixed charges with lighter cars is of prime importance in the cases of compulsory replacement and additional equipment. All of us are so thoroughly familiar with this fact that it is unnecessary to elaborate on it here. But I do wish to call attention to the possibility of saving enough in operating costs, by using lighter cars, to make the retirement of even good heavy equipment a profitable procedure. The detailed statement and solution of such a case are beyond the scope of this paper, and each case must, therefore, be settled entirely on its own merits.

Operation with one man instead of two will not save as large a proportion of the operating expenses on interurban properties as on city systems. Statistics published by the American Electric Railway Association for a typical year show for seventy-two city and fifty-five interurban properties that the cost of conducting transportation was respectively 45 per cent and 30 per cent of the total operating expense. Car for car replacements on interurban lines, therefore, should not be expected to show direct returns of as high an order as on city properties. On the other hand, the greatest all-round benefit is likely to be derived from the provision of more frequent service without any increase in line copper, substation equipment or power house apparatus. More frequent service correctly operated and advertised will certainly produce more revenue and the amount of this is increased by the improved public relations which invariably follow the operation of new cars more frequently.

The proper analysis and solution of operating and traffic conditions are problems which can best be solved by a high class transportation engineer working in conjunction with the equipment engineer and the master mechanic. In determining the advisability of using lighter cars, their effect on numerous things must be investigated. I have discussed only a few of these and shall indicate only some of the others. For example, consideration of steam railroad competition carries with it the study of fares, including those for city cars and taxi cabs; time of trip, including changing cars; convenience, and the character of steam service as defined by frequency, speed and equipment. The study of the extent of replacements of, or additions to, rolling stock will be affected by the number of cars, annual mileage per car, per cent of weight reduction, schedules, probable earnings, operating costs and fixed charges. When everything has been taken into account, the result will show the steps necessary to secure the greatest over-all return.

ESTIMATES MADE HEREIN ARE CONSERVATIVE

The amount of possible weight reduction suggested has been made conservative intentionally. The present weight of the safety car is considerably more than that of the earliest ones. So, in working toward weight efficiency for other types of cars, we should avoid going too far. While I have talked primarily about high-speed interurban cars, we should not leave the subject without reference to the large field of interurban service at somewhat lower speeds. Many cars weighing from 30 to 45 tons and equipped with from four 75-hp. to four 100-hp. motors are being operated in service which requires no speed higher than 40 to 45 m.p.h. The possibility of economy through car weight reduction in such cases is even greater than has been indicated for the high-speed service. In certain specific cases that have been studied, it has developed that new light cars could be used for the complete retirement of existing cars with economy sufficient to pay for the entire cost of the change in from three to six years.

The variety of conditions to be met in interurban service is not so great as to preclude a certain degree of standardization on general types of cars. I need not go into the economical advantages of reasonable standardization as that question has been frequently presented and discussed. Probably speed is the most important physical factor in determining suitable car weights. On this basis, it is my opinion that the majority of interurban requirements can be well and economically served by, say, four sizes of cars for the usual speed range, namely:

Approximate Total Weight of Car Fully Equipped	Maximum Speed
25,000 lb.	30 to 35 m.p.h.
32,000 lb.	35 to 42 m.p.h.
42,000 lb.	42 to 50 m.p.h.
60,000 lb.	50 to 60 m.p.h.

With the outlook for the electric railways growing more favorable, it seems to me that this is an opportune time for co-operative action by the railways, car builders and equipment manufacturers with a view to reasonable standardization of new cars for greater economy. A thorough analysis of this problem by your association through its Engineering Council would, I believe, produce very great returns for the individual railways.

The "Rubber Urge" in Transportation*

The Author Thus Characterizes the Economic Force Which Has Brought About the Phenomenal Development of the Motor Truck and Bus

By Zenas W. Carter
The White Company, Long Island City, N. Y.

A MIGHTY wave of desire to "ride on rubber" has been sweeping the United States during the past few years. It seems fitting to call this desire of the public a "rubber urge" in transportation.

Just what the psychology is back of this wave, and constantly increasing its size, is of less interest to the electric railway operator than the question of this influence upon his daily problem.

The electric railway operator is in the transportation business. He uses steel rails and electricity as his work tools. Theoretically he is interested only in steel rail and electricity.

Commercially and practically, however, he is in the transportation business, and the "rubber urge" is a feature of the transportation business. It affects both freight and passenger business. Motor trucks and buses are here to stay. Their use is rapidly increasing everywhere and on every highway. They are essentially and actively an important part of the transportation business of today.

Thus, as a transportation man the electric railway operator finds his attention centering more and more upon the problem of co-ordinating motor buses with his electrical operation.

Just how this may be done best to cater to public demand to "ride on rubber" is an individual problem in each particular case. No general rule can be set up which will fit any two cases.

Motor Vehicles Must Pay in One Way or Another

However, this much can be stated most emphatically—motor trucks and motor buses must represent an ultimate economy or they are a distinct liability.

The question of economics in electric railway operation is not necessarily a question of making a specific profit on a definite installation of motor equipment. On the other hand, there are hundreds of profitable motor-bus lines in operation in the United States in territory which was not being served by either the electric or steam companies. It is reasonable to assume that this business belonged to the transportation companies, either the steam or electric operators, but was lost largely through lack of interest in making surveys for motor-bus operation.

Several of the larger electric and steam railway companies have, however, checked over their prospective fields and are now actively in the business of catering to the public idea that they desire to "ride on rubber."

Electric railway operators will be interested to know that an independent bus operator carried more passengers per bus in twenty-three buses which he operated in Wilkes-Barre, Pa., in 1921 than were carried by the same number of the buses of the Fifth Avenue Coach Company in New York City. The figures are: For Wilkes-Barre, 183,891 passengers per bus; for New York City, 174,192 passengers per bus.

Motorization of Highway Traffic Is a Logical Development

Our steam railway and our electric railway operations have been largely revolutionized through the development of the several types of motive forces. The application of these same power forces to industry, electricity, steam and gas has changed our entire country from a manual institution into a mechanical institution. In a measure, motorization of our highways is likewise a change from a manual to a mechanical method of highway transport. With almost 11,000,000 motor vehicles already on our highways, all individual highway transport will soon be by motor.

The steam and electric railways will reap a return ultimately from this motorization, as it will tend still more closely to knit the country into a corporate economic unit to promote quick exchange and rapid interchange.

The motor on the highway offers the opportunity to supply the public with both local and express service operating over the same route, while this is impossible on single line rail. Many electric railway companies could probably operate bus lines paralleling their rails profitably, especially in congested centers, operating the bus lines for express service and using the electric service almost entirely for local stops. In other cases such a service might solve a rush-hour congestion problem profitably where the addition of extra cars would only tend to slow up movement and increase congestion.

Another field for the use of buses in conjunction with electric line operation is in territory where development has spread the area served until a large percentage of possible short-haul passenger business is lost on account of the distance the passenger must initially walk to reach the trolley. The use of buses covering such a section over what might be called a curved or bow route paralleling the trolley service at some distance but not operating on exact trolley schedule would often prove distinctly profitable and prevent competition.

Also, picking up and delivery at curb, whether in urban or in congested city territory is a psychological element to consider in the opportunity to increase short-haul traffic.

Do Not Overtax the Highway Vehicle

There is agitation in some sections to have the motor vehicle more heavily taxed. Fundamentally, this is moving in the wrong direction except in so far as all vehicles using the highways may be taxed in proportion to their proper share of maintenance. Figures show this to be already accomplished.

The motorization of our highways is itself the economic force which has compelled the betterment of our highways and to increase taxation of this special class group would seem to tend to drive backward instead of forward.

Even the interests of the steam and electric roads may ultimately be served better by low taxation of motor vehicles than by high taxation. The steel rail carriers, both steam and electric, are the transportation industry. Sooner or later they will own and operate their own motor-truck and motor-bus lines. For this reason, it seems fitting that all transportation interests can well refrain from agitating for taxation which may ultimately tend to become a boomerang tax.

The Motor Truck Long Useful on Electric Railways

The motor truck in electric railway service departments has naturally been proven economical as a factor in trolley operation much more quickly than the use of the motor bus by the passenger departments. In this service for public utility corporations, there are as many different kinds of uses for the motor truck as there are different types of work to be done.

There is also a use of trucks for supplementary freight service which may soon grow into large proportions. An example is the extension of electric railway freight lines into off-line territory such as has been inaugurated by the Cincinnati, Aurora & Lawrenceburg Electric Railway. An operation somewhat similar to the container plan followed in Cincinnati, but using trailers, is in service in Chicago, as part of the freight system of the Milwaukee Electric Railway.

The total registration of motor vehicles for 1921, as shown by the tabulations of the Bureau of Public Roads, was 10,465,995. Of these 9,342,844 were passenger cars; 982,604

---

*Abstract of paper presented before Central Electric Railway Association, June 25-30, on board the S.S. *South American*. A more extended abstract will appear in the August issue of *Bus Transportation*.

were trucks and commercial cars; 50,547 were taxis and buses.

These startling figures are very important in interesting the electric railway industry when compared with the statement from the Jan. 7 issue of the *Electric Railway Journal* to the effect that there was 149.79 less mileage of electric rail in service in 1921 than in 1920 and that the total of cars and locomotives in service was only 106,385 in 1921, compared with 106,688 in 1920.

In the present situation as it relates to the use of the motor truck for carrying freight in co-operation with the electric or steam railway and as it relates to the use of the motor bus or the rail bus for carrying passengers in co-operation with either, this new means of local transport offers an opportunity for the railway interests to be carried along into this new field of transportation. These nearly 11,000,000 vehicles cannot now be superseded by systems of either steam or electric transportation.

The motor truck for short-haul freight service offers the opportunity to pick up freight and make delivery with just two manual handlings of the goods as compared with four handlings if the goods must be loaded into and taken from a box car. In passenger transportation the motor bus offers a system exceedingly flexible which may be co-ordinated profitably with a system rigidly inflexible.

Already many of the electric railway fraternity have been inspired by the profit in motor truck and motor bus operation. They have expended the energy necessary to investigate.. The more carefully they investigate, the more rapidly will this new transport unit—the motor vehicle—be inducted into service as an integral part of electric railway operation. Thus will the "rubber urge" prove to be an economic force in transportation.

Secretary Hoover Opens Meeting of American Construction Council

IN OPENING the organization meeting of the American Construction Council at the Washington Hotel, Washington, D. C., June 19, Secretary of Commerce Hoover stated: "If we would stem the tide tending to refer every little need and complaint to government, action to meet these demands must arise from within industry itself." He declared that in thus bringing all representatives of the construction industry together to see if such a council can be organized the most important step in the history of industry was being taken.

Among the subjects suggested by Secretary Hoover for the consideration of the council were standardization of grades, inspection of and simplification of dimensions of construction materials, the collection of statistics, the encouragement of home building, zoning, proper building codes, seasonal and intermittent employment, jurisdictional disputes, apprenticeship, vocational training and in general the elimination of unnecessary speculation and the better functioning of industry in regard to our national needs.

International Engineering Congress

TELEGRAPHIC dispatches from Rio announce that the Brazilian Government has approved of the plan of holding an international engineering congress in Rio next September.

It is understood that representative engineers from all the American countries will attend and that the principal subjects of discussion will be:

1. The utilization of fuel resources.
2. The best utilization of water power.
3. Recent advances in irrigation methods.
4. The elimination of waste through the standardization of supplies for agricultural and industrial purposes.
5. Coal as a factor in industrial development.
6. Essentials of a national railroad policy.
7. Intercontinental engineering co-operation.
8. Port developments.
9. Terminal facilities.
10. The iron and steel industry.

Electric Power Men Perfecting Organization

ON JULY 12 and 13 there will be held at Madison, Wis., a meeting of the National Technical Executive Committee of the National Electric Light Association. The meeting is called to work out details of a plan for increasing the value of the technical section through the organization of geographic divisions.

At the June meeting of the executive committee it was decided to organize, to the extent necessary in each division, committees comparable to those existing in the technical national section, namely, electrical apparatus, hydraulic power, inductive interference, meters, overhead systems, prime movers, safety rules, underground systems.

The executive committee is organized under the chairmanship of R. F. Schuchardt, Commonwealth Edison Company, Chicago.

Railroad Problems Discussed

THE July number of the "Proceedings of the Academy of Political Science" is devoted to the subject of the relation between the railroads and business prosperity. It includes discussions on such subjects as railroad regulation, railroad labor, functions and policies of the Railroad Labor Board, transportation act of 1920, rate making, etc.

The volume brings down to date much of the material in the Academy "Proceedings" for January, 1920, on "Railroad Legislation," which discussed fully the problems entering into the making of the transportation act of 1920.

Work on Welded Rail Joints Is Progressing

THE executive committee of the committee on welded rail joints, which is functioning under the auspices of the American Bureau of Welding, held a meeting at the offices of the National Research Council in New York City on June 21. Chairman G. K. Burgess presided and the following were present: E. M. T. Ryder, vice-chairman; W. Spraragen, secretary; H. M. Steward, R. C. Cram, W. F. Graves, C. F. Gailor, G. C. Estill and W. F. Hulburt. An extended discussion of plans for obtaining funds for the work took place. The close relation of the committee to the American Electric Railway Engineering Association indicated a need for co-ordinating financial questions to secure co-operation with the committee on way matters of the latter in connection with the testing machine now being considered by that committee.

Plans for getting the several investigations under way were considered and letters to steel companies, railway companies and laboratories, describing the work and the respective parts to be allotted to the above interests, were approved.

It was decided that in all joints use should be made of Association Standard Grade B girder rail with 0.75 per cent carbon content and that the best joints should be submitted to the following tests: (a) tensile, (b) bending, (c) drop, (d) fatigue. These tests will be made under the direction of the committee. The tensile tests were assigned to the Bureau of Standards, the bending tests to Purdue University, the drop tests to the Lorain Steel Company and the fatigue tests to the Philadelphia Rapid Transit Company. The last-named company will presumably use the special machine recently installed by E. J. McIlraith, superintendent of rolling stock and buildings.

Other tests such as conductivity tests, chemical analyses, macroscopic, microscopic, etc., are to be made also. A general method of making up the test joints, to insure uniformity, was devised and will control the work of those who submit joints for test purposes.

A letter from Prof. D. D. Ewing of Purdue University was read tendering the use of certain important facilities for tests and the committee will avail itself of this generous offer.

The work of the committee is getting well under way and its members are pleased with the progress made and with the evidence of great interest in the work which is being displayed by members of the electric railway industry.

[NOTE—Subsequent to the above meeting representatives of the rail joint committee were in conference with members of the executive committee of the American Electric Railway Association, looking toward a closer co-operation and the possibility of financial support.—EDS.]

National Safety Congress in Detroit

THE eleventh annual congress under the auspices of the National Safety Council will be held in Detroit, Mich., Aug. 28 to Sept. 1. The electric railway section session Wednesday morning, Aug. 30, will be under the direction of B. D. Hoskins, Chattanooga Street Railway, chairman of this section; H. B. Potter, Boston Elevated Railway, vice-chairman, and M. W. Bridges, Metropolitan West Side Elevated Railway, Chicago, Ill., secretary. The session will open at 9.30.

Reports of the chairman, secretary and committees will come first, followed by these addresses:

On the Most Efficient Manner of Conducting Safety Work, by C. B. Scott, general manager Bureau of Safety, Chicago, Ill.

On Safety as an Operating Factor, by F. R. Coates, president Community Traction Company, Toledo, Ohio.

American Association News

Executive Committee Meets in New York

THE postponed June meeting of the executive committee of the American Association was held at association headquarters Saturday afternoon, July 1. The committee disposed of a large number of individual items which were before it for attention.

The financial committee presented the quarterly report of the association's auditors which showed everything at headquarters in excellent shape.

The report from the publicity committee showed a very active continuation of the publicity work by the advertising section of the bureau of information and service. In his report for the publications committee, Mr. Storrs mentioned the fact that *Aera* is now under the direction of the new editor, J. W. Colton, and that constructive criticism as to how to make *Aera* a better publication for the association would be welcome. The program committee reported substantial progress on the program for the fall convention.

The membership committee report as usual showed a gain in membership, there being three new railway and three new manufacturer members.

The committee decided to issue a formal invitation to the officers and members of the Canadian Electric Railway Association to attend the October convention. It was voted as member of the American Engineering Standards Committee to admit the Panama Canal to membership in the organization.

The committee approved a resolution of the engineering association executive committee addressed to the Department of Commerce indorsing the simplification of design program. It also gave approval to the action of the engineering association in submitting nine of its standards to the American Engineering Standards Committee. Those present at the meeting were President R. I. Todd, L. S. Storrs, A. W. Brady, W. H. Sawyer, C. D. Emmons, L. H. Palmer, J. N. Shannahan, Carl Beck for C. R. Ellicott, George Haskell for Samuel M. Curwen, and Executive Secretary J. W. Welsh.

The next meeting of the executive committee will be held in Toledo on July 28.

Engineering Association O.K's Simplification Principles

THE following resolution, presented by the executive committee of the Engineering Association, was approved at the meeting of the American Association on July 1:

Whereas the American Electric Railway Association is thoroughly in accord with the proposal of the Department of Commerce looking toward the simplification of practice in industry and the elimination of waste through standardization, and

Whereas the American Electric Railway Association believes it to be the duty of all national industrial organizations to render every possible assistance in this important and far reaching undertaking; therefore, be it

Resolved, That the American Electric Railway Association, as a member of the American Engineering Standards Committee, express its earnest desire to assist the Department of Commerce in this movement, by helping to establish between the Department of Commerce and the American Engineering Standards Committee the greatest measure of co-operation to the end that the work of these two organizations may be properly co-ordinated; and be it further

Resolved, That the executive secretary of the American Electric Railway Association be instructed to inform the Department of Commerce that C. S.

Why a Record Number of Electric Railway Men Will Attend the A.E.R.A. Convention in Chicago Next October

My dear Bozell: I am going to answer your letter asking me for reasons why a record number of electric railway men should attend the A. E. R. A. convention on the Municipal Pier in Chicago, Oct. 2-6, by sending you another letter I have just received from a friend.

This second letter, from an electric railway operator, was dropped on my desk along with yours. It gives his reasons for attending the convention. They appeal so strongly to me that I am sure I could not improve upon them regardless of how much I tried. Here is his letter:

> I AM GOING to see the exhibits. We have not had exhibits since 1920 and there will be many new time and money saving devices which I shall want to see.
>
> I AM GOING to hear the addresses. Preliminary outlines of the subjects to be discussed convince me that every one of them touches some vital problem on my property.
>
> I AM GOING to take part in the discussions. The policy of having liberal discussions of papers appeals to me because under it if I don't hear what I want to learn, I can speak up and find out.
>
> I AM GOING to get more money for my stockholders and make my own job more secure by learning the most economical and attractive operating methods.
>
> I AM GOING to talk with hundreds of my friends who, often in a few minutes, can tell me more about short-cuts to successful operation than I can learn in a year by my own unaided efforts.
>
> I AM GOING to learn all I can about improved operating in order to play square with my customers. When I was almost put out of business by the war, I promised them that if they would help me I would give them improved service as fast as I could. Now that business is improving I propose to keep faith with them.
>
> I AM GOING to have a good time. I've been glum enough and stayed at home enough during the last four or five years. Now I'm going to prance about a bit.

If you will pass this friend's letter along to the industry generally through the medium of the *Electric Railway Journal*, you will do a real service and I shall be sincerely grateful to you.

Robt. I. Todd

President

Kimball, Engineer of Way and Structures, Washington Railway and Electric Company, Washington, D. C., be and hereby is authorized to respond to any call that may come from the Department of Commerce through the American Engineering Standards Committee for representation in connection with any matter of interest to the electric railway industry.

Additional Convention Committee Appointed

PRESIDENT R. I. TODD has appointed a boosters' committee for the purpose of putting additional "pep" into the convention publicity. The personnel is as follows:

Henry A. Blair, president Chicago Surface Lines, Chicago, Ill., and Britton I. Budd, president Metropolitan West Side Elevated Railway, Chicago, Ill., co-chairmen; Edwin C. Faber, vice-president Barron G. Collier, Inc., New York City, vice-chairman; W. R. Alberger, J. P. Barnes, Luke C. Bradley, F. G. Buffe, F. D. Burpee, C. D. Cass, F. C. Chambers, H. E. Chubbuck, J. F. Collins, R. E. Danforth, B. J. Denman, H. F. Dicke, B. J. Fallon, Williston Fish, A. Gaboury, M. L. Garrity, E. M. Graham, Franklin T. Griffith, Frank Hedley, J. R. Jeffrey, A. L. Kempster, C. K. Knickerbocker, Myles B. Lambert, George R. Lyman, C. E. Morgan, Col. A. T. Perkins, A. E. Potter, Harry Reid, G. A. Richardson, John Shartell, Paul Shoup, John J. Stanley, T. H. Tutwiler, S. B. Way, E. A. West, Thomas W. Wilson and C. V. Wood.

Other committees which are looking after convention details are the standing committee on subjects and meetings, C. D. Emmons, chairman; the committee on exhibits, E. J. Blair, chairman (see *Electric Railway Journal*, May 27 issue, page 875); the committee on entertainment, J. V. Sullivan, chairman (see *Electric Railway Journal*, June 17 issue, page 977).

Entertainment Committee

THE first meeting of the convention entertainment committee, of which J. V. Sullivan, assistant to the president Chicago Surface Lines, is chairman, was held in Chicago on June 23. Various entertainment suggestions were discussed and the general decision was reached to hold a reception on Monday night, a ball on Thursday night and some feature entertainment on either Tuesday or Wednesday evening. To facilitate the working out of the various details, the following subcommittees were appointed: Reception—J. V. Sullivan, H. L. Monroe, Thomas Finigan. Music and dancing—John Benham, E. E. Kretschmer, Thomas Finigan. Ladies — W. H. Beattys, Jr., H. J. Kenfield, Martin Schreiber. Feature Night — E. F. Wickwire, J. A. Alexander, Harry L. Brown, J. R. Blackhall. Golf—N. G. Symonds, Frank Porter, G. T. Seely.

In view of the exceptional opportunities for entertainment in Chicago, the committee is anticipating that it will be able to arrange some attractive features for the delegates.

Mr. Glover Appointed to Standard Classification Committee

ON JULY 1 the secretary of the American Electric Railway Accountants' Association announced that M. W. Glover, general auditor West Penn Railways and past-president of the American Electric Railway Accountants' Association, has been appointed a member of the committee on standard classification of accounts in place of W. H. Forse, Jr., resigned. The original committee on standard classification of accounts of the association was appointed in 1897, at the same time the association was organized, and a review of the work of the committee during the twenty-four years of its existence was published on page 175 of the issue of this paper for July 30, 1921.

Mr. Glover will bring to the committee the benefit of an extended experience in accounting matters. In this connection it is interesting to note that he is also now chairman of the committee on classification and application of accounts of the Accounting Section of the Pennsylvania Electric Association and also a member of the classification committee of the Accounting Section of the National Electric Light Association.

T. & T. Association Men Study Psychology

THE principal thing on the minds of the members of the Transportation & Traffic Association committee on personnel and training of transportation department employees, which met at Montreal, Que., on June 30 was the carrying out of the instructions of the executive committee regarding mental tests for applicants for employment in this department. The meeting was attended by Chairman J. E. Wayne, York, Pa., and Dr. John Leeming, E. M. Graham, F. L. Butler, H. H. Norris, A. P. Norris and Arthur Gaboury.

The committee considered in detail the recommendations of a sub-committee on the subject of mental tests and decided to submit a considerable number of such tests to the association for consideration in October. It is the hope of the committee that the member companies will co-operate in carrying out the suggestions which will be made in the report, with a view to securing data for future standardization.

The committee also put the finishing touches on application forms for use in this department, and upon a form for recording the results of physical examination.

After the business session the committee visited the training school of the Montreal Tramways, under the direction of Mr. Gaboury and the instructors in charge of the training, examined the instruction car which is used as a part of the training equipment and made a general study of the Montreal property. The committee was impressed by the satisfactory way in which the details of transportation department employee training had been worked out to fit the local conditions. The meeting was remarkable in that, although it was held considerably off the geographical center of the committee members' homes, it was attended by all but one member, who was unavoidably detained.

Special Reports and Compilations

THE Bureau of Information and Service of the American Association announces that the following special reports and compilations are now available to member companies in good standing, upon request:

Employees' Welfare Work—A summary of measures taken by manufacturing companies to promote better relations with their employees and secure their well-being.

Public Utility Laws—A summary of the laws creating the state public utilities commissions, giving an analytical digest of the main provision covering their jurisdiction and powers over transportation companies. This is the second installment of this compilation, which was begun in June.

Sale of Securities to Employees and Patrons—Contains list of companies that have tried this, the methods used and the results attained.

Motor-Bus Operating Reports — Statements of operations of eight companies, including the London General Omnibus Company, the Baltimore Transit Company and six California companies.

Electric Railways Operating Motor Buses as Auxiliaries—Gives name of company, number and type of bus operated, seating capacity, year purchased and fare charged.

Paving Decisions—These are abstracts of court and public utility commission decisions on the assessment of paving cost against electric railways.

Supplement to Employeers' Welfare Work of electric railways issued last month, containing replies of several companies received too late to include on June 1.

In addition to the above, supplements to the wage bulletin, the fare bulletin and cost-of-living studies have been prepared bringing them up to date.

New Association Publications

THE American Electric Railway Association has recently published in mimeograph form the following publications:

"Employees' Welfare Work"; this is an account of the pension systems, mutual benefit associations, insurance, sale of stock, loan funds, etc., undertaken by electric railways to improve the condition of their employees.

"Public Utility Laws"; this is a summary of the powers of the different state public utility commissions.

PERSONAL MENTION

Chaos in Steubenville

Refusal of the Company to Recognize Union Factor in Strike Raging Two Months

At the present time there seems to be no indication of a settlement between the Steubenville, East Liverpool & Beaver Valley Traction Company, Steubenville, Ohio, and its striking employees. Operations on all its lines in Columbiana, Hancock and Beaver Counties have been tied up since May 1 and operations on all its lines in Jefferson County have been suspended since May 4. A communication sent by the company after the annual meeting of the directors late in March to each of its employees, notifying them that after May 1 the company would no longer deal with them as a union, but as individuals, caused the carmen to walk out.

WAGES AND FARES NOT FACTORS

The wage question and fare increases play no prominent part in the controversy, according to general belief. The carmen say that all wage differences could be settled without dispute if the company would recognize the union and the company officials enter no denial to this statement. Whether or not the company shall be permitted to raise fares on any of its lines will not be decided until operations on its lines are resumed.

The directors of the company held their annual meeting late in March and following their conference every employee received a notice that after May 1 he would be dealt with as an individual and that after that date he and his fellow workers would no longer be dealt with as a union. May 1 was the date set by the company when it would no longer recognize the union as its contract with the carmen was to expire on that date. Late in April Hugh Thorne, president of Division 52, Amalgamated Association of Electric Railway Employees of America, filed an action in Columbiana county court, seeking an injunction to restrain the company from terminating its agreement with the union. The application was refused and the men decided not to report for work on May 1.

Officials of Division 285, of which additional employees of this company are members, filed an application in Common Pleas Court of Jefferson County on May 1 for an injunction restraining the company from putting into effect at midnight that day a "lock-out." A temporary injunction was allowed, but on May 3 the court refused a permanent injunction. On the morning of May 4 carmen of Division 285 held a meeting and that morning all lines of the company in Jefferson County were tied up, the men deciding that they would not walk out.

Only one attempt has been made by the traction company to operate its cars with non-union men. At East Liverpool on May 4 fifty strike breakers arrived from Cleveland and an attempt was made by five of them to operate a car, but a mob of 200 people attacked them and never since has any attempt been made by the company to operate cars on any of its lines which are tied up.

Within a few days after the lines of the company were tied up efforts to end the controversy were taken. Conferences were called at Steubenville, East Liverpool and Wellsville. Citizens, public officials and representatives of the carmen and company attended, but a settlement seemed impossible. Wellsville and East Liverpool City Councils also met and discussed possible means of a settlement. On May 15 an attempt was made at East Liverpool to arbitrate, but no progress was made, the officials of the traction company refusing to arbitrate because one of the members of the board of arbitration was a member of Division 285. The company at this meeting refused to deal with the union. No further attempts have been made at East Liverpool to arbitrate.

ARBITRATION WITHOUT SUCCESS

The city of Steubenville enforced its ordinance compelling arbitration. The board of arbitration, consisting of one member selected by the employees, one by the company and the remaining three appointed by the Common Pleas Judge of Jefferson County, met at Steubenville on May 24. All attempts to arbitrate failed, the company at this meeting refusing to arbitrate with its men as a union. The board of arbitration has not met since, with the result that the traction situation on the lines of the Steubenville, East Liverpool & Beaver Valley Traction Company is practically unchanged since the inception of the controversy.

New Wage Scale in Effect

A new wage scale and working agreement have been negotiated and signed by the union and Monongahela Power & Railway Company, Fairmont, W. Va., which went into effect on July 1. W. C. Kline, manager of railways, represented the company in all of the negotiations.

The agreement gives men longest in sevice on the interurban runs 55 cents per hour and men longest in service on city lines 54 cents. The scale is graduated from 55 cents down to 42 cents.

No Appeal Filed

Conferences Held Between City and Des Moines Railway—Threatened Five-Cent Fare Not in Force

As yet no definite action has been taken toward appealing the decision of Judge James C. Hume of the Polk County District Court in which he ruled that the franchise granted the Des Moines City Railway last November was invalid.

Attorneys for the city of Des Moines and for the railway have conferred as to a method of procedure and it is said that the city attorneys favor the city taking a part in the appeal if the expense is borne by the Des Moines City Railway. Corporation Counsel J. J. Halloran recently announced that the company had agreed to bear the cost of the transcript, which is the largest part of the expense in connection with the appeal. It is thought, therefore, that definite action will be taken soon toward filing the appeal.

The North Des Moines Improvement League and H. W. Byers, its attorney, who brought the suit to declare the franchise invalid, have as yet failed to make good their threats to force an immediate 5-cent fare. There has been no demand on the part of the public to ride at the lower fare. In fact, the car riders seem entirely satisfied to pay 8 cents in view of the tremendous improvement in service which has been made since the higher fare was granted.

TOTAL REVENUES FOR MAY $204,612

The futility of Attorney Byers' claim that the company can operate with profit on a 5-cent fare is seen in the company's financial statement for the month of May. Passenger revenues for the month according to the report filed with the city were $198,731. There were other revenues of $7,811, bringing the total revenues for the month up to $204,612. Operating expenses and depreciation charges for May totaled $149,997 and taxes amounted to $15,000. This left $39,606 from the revenues, of which $20,588 was set aside for fixed charges, including bond interest, note interest and other interest items, leaving $5,901 for the cushion fund. Total revenues for May were $2,500 less than those of April while operating expenses increased approximately $8,000 during the month over April. Coal costs are eating up the profits. At the present time the company is paying $8 a ton for coal.

It is interesting to note that had a 5-cent fare been in effect during May instead of a profit of $5,901 for the cushion fund the company would have operated at a deficit of $55,598, providing the traffic had remained the same.

Buffalo Lines Tied Up by Strike

Mitten Management Rejects the Closed Shop—Prepares to Rebuild Entire Transportation Staff—Service Promised on Monday—Wage Cut Has Become Minor Issue in Struggle of Railway Against Union Domination

About 2,350 employees of the International Railway in Buffalo, Niagara Falls and Lockport and on the interurban lines between these points are on strike. They include motormen, conductors, carhouse men and shop workers, members of the Amalgamated Association.

The only point at issue between the employees and the company is union recognition. Two days before the strike order went into effect, Thomas E. Mitten, president of the Philadelphia Rapid Transit Company and chairman of the board of directors of the International Railway, announced the withdrawal of the wage cut of 2½ cents an hour which was to have been put into effect on July 1.

Herbert G. Tulley, president of the International Railway, made this statement of the situation to the *Electric Railway Journal:*

> The union which now demands a contract with International broke such a contract in 1918 and subjected Buffalo to a long-drawn-out strike. This contract covered the period from May 1, 1918, to May 1, 1919. The strike was called in October, 1918.
>
> The present non-observance by the union of an understanding by its national president, the terms of which, if observed, would have prevented the present difficulty, again demonstrates that the International Railway cannot secure permanent peace nor properly operate its cars through a contract with this union, which neither recognizes the need of good railroading nor the necessity of living up to its understanding.
>
> The International Railway under Mitten Management never interferes with the men belonging to the union. On the other hand, it never makes a contract with a union, but stands foursquare for the open shop.

The understanding referred to by Mr. Tulley as existing between Mr. Mahon and Mr. Mitten was that there should be no change in the situation existing between the employees and the company until May 1, 1923. Mayor Schwab had said the men had promised him that if such an understanding was in effect and the company would produce the correspondence, the men would return to work. Mr. Mitten did produce correspondence, but Mayor Schwab then contended that the evidence was insufficient and he would take no action.

Efforts of the Mayor to bring about a settlement through arbitration were met by Mr. Tulley with the statement that union recognition cannot be arbitrated. He added that "the International stands four square for a continuation of the open shop principle, and cannot, in the interests of permanent peace and continued service, agree to a contract with the union."

The striking employees sent by messenger to President Tulley of the railway company and Mayor Schwab a proposed basis of settlement of the strike which would provide for reinstatement of all employees in their former positions; recognition of the union; a written contract between the company and the organization covering wages and working conditions; wages paid by the company as of June 30, 1922, to remain in effect for a period of one year; a written agreement providing for arbitration of all disputes which cannot be settled by the two parties to the agreement.

Platform men on the International lines had been receiving a maximum of 55 cents an hour.

Service to Be Resumed Monday

Plans are being made by Mr. Mitten and President Tulley to operate cars over several of the local lines of the International in Buffalo. A large number of men are being brought to Buffalo from Philadelphia and other cities where the company has been recruiting an operating force for about ten days preceding the strike. The men are housed in the various carhouses. Car windows will be screened by a heavy wire mesh and armed guards and city policemen will follow each car on motorcycles and automobiles provided by the company.

Mail cars are being operated twice daily over the Olcott-Lockport interurban division of the International by A. S. Henry, superintendent of the division. The cars are plainly marked "Mail Car" and no attempt has been made by the strikers to interfere with their operation. This division of the International serves a large rural territory in Niagara county not served by any other means of transportation. No attempt has been made by the company to carry passengers on these cars.

Many of the striking employees are members of the Mutual Benefit Association, which was organized by the International on the lines of a similar organization in Philadelphia.

In its statement to the public, the striking employees said:

> We want our rights as citizens of Buffalo to associate ourselves into mutual society, and will resist any un-American attempt to force us into social subjection, though the plan may be governed by the most benevolent despot on earth.

All kinds of motor trucks, buses and small automobiles were pressed into service during the strike. More than 5,000 automobiles were licensed by the city to carry passengers at a fare not exceeding 10 cents and many large trucks, carrying posters announcing that they carried insurance for passengers, transported passengers from the heart of the city to Riverside Park, a distance of 6 miles for 5 cents.

At the outset of the strike the municipal authorities started to regulate the bus traffic and within twenty-four hours, buses were running over regularly established routes at a uniform rate of fare but were closely watched by motorcycle traffic officers detailed to facilitate the movement of jitneys throughout the congested retail shopping district.

In the congested section of Main Street, bus drivers were ordered to use the street car tracks and load passengers only from the platform loading stations at street corners. Private vehicles were ordered to operate near the curb so as not to interfere with the loading of jitneys at street corners.

The state authorities announced that owing to the emergency in Buffalo, Niagara Falls and Lockport it would not be for the best interests of the people to enforce the new law requiring the owners of cars operating for hire to comply with the insurance requirements.

The Buffalo Chamber of Commerce has come out in support of the open shop stand taken by the International and in a series of display advertisements in the daily newspapers says:

> The closed shop is not a matter of arbitration. We pledge to the Mayor and the Councimen of the city our full support in the discharge of their duty in preventing, in case of need, interference with those seeking employment and in the use, for this purpose, of all the forces of law and order to protect them and punish those who, by violence, intimidation or ostracism, restrict their freedom.

The Employers' Association of Buffalo has pledged its full strength to the International in its efforts to restore service over local and interurban lines with an open shop organization. The association in a resolution says the strike represents no issue other than a vain attempt to fasten "the closed shop system upon the company, and the compulsory payment of union dues upon the employees of the company."

All the Buffalo papers deplore the strike. The *Commercial*, however, is most outspoken in upholding the attitude of the company. In a recent editorial it said:

> The leaders of the street car men's union have taken the gamblers' chance. Their future existence hangs upon a single throw of the dice. If they win the union will hereafter be able to dictate to the International in the matter of wages and working conditions. If they lose they lose everything. The Amalgamated on the Niagara frontier will be destroyed and in its place we shall see put into effect the Mitten idea, which has won golden opinions from sociologists as well as from working men who are familiar with it.

About thirty platform men employed on the Buffalo & Lackawanna Traction Company's line between Buffalo and Lackawanna also went on strike at midnight July 1. The strike is for union recognition only, no question on wages being involved. The line is operated by Harry L. Evers as receiver and is part of the Buffalo & Lake Erie Traction Company system operating between Buffalo and Erie, Pa. The line west of Lackawanna, however, is not affected by the strike as the Amalgamated has a contract in force with the company.

Ordinance Submitted

Louisville's Mayor Approves of Sliding Fare Scale with a Seven per Cent Return on a Five-Cent Fare

Immediate return to a 6-cent fare if tickets are purchased, surrender of all franchises by the Louisville (Ky.) Railway, some of which are perpetual, and its acceptance of a blanket franchise for twenty years covering all its lines, establishment of a sliding scale of fares to be adjusted according to fluctuations in the company's income, and municipal regulation of the company through the board of public safety, with the right given to the city to purchase the entire system at the expiration of the twenty-year franchise if the voters so desire, are some of the outstanding points in the ordinance prepared by Mayor Quinn and submitted to the City Council. The general opinion is that the ordinance will be accepted as it stands. If the ordinance is accepted litigation between the city and the company will be discontinued and no rebate will be required of the company on the 7-cent fare it has been collecting.

ARBITRATION OF DISPUTES PROVIDED

Provisions scarcely less important establish means for arbitration of disputes that may arise between the company and the board of public safety. The board is empowered to employ technical assistance for carrying on a continuous audit of the company's books, which will be balanced every six months. The fare for the six months following each audit will range from 5 to 7 cents according to the showing of the books. The company is required to pay $10,000 annually into the city treasury to defray the expense of this work, this amount not to be charged to operating expenses.

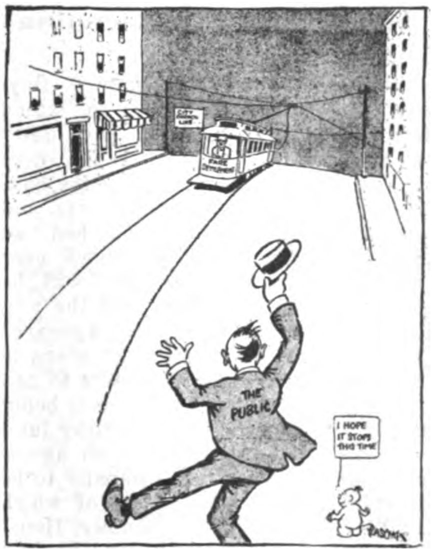
The sliding scale of fares is as follows: 5 cents cash with six tickets for 25 cents; 6-cent fare with five tickets for 25 cents; 7-cent fare with five tickets for 30 cents; and 7-cent fare with five tickets for 35 cents. The latter is the maximum rate, the one now in effect. No charge will be made for transfers.

The company now has on hand, according to the city auditor's office $700,000, from which a "barometer fund" of $350,000 will be created by the terms of the ordinance. All income shall be deposited to the credit of this fund. Whenever this fund reaches $500,000 during any six months period the fare will be automatically reduced to the next lowest schedule of fares. When the barometer hits below $200,000, the rate automatically increases to the next highest fare schedule.

The surplus over $300,000 which the company now has on hand, together with surplus accumulated between now and Dec. 31, 1922, will be spent on improving the service and facilities of the company. This fund is estimated at $900,000.

Bond and stockholders of the company will be protected under the ordinance. The company's bonded indebtedness, preferred stock and common stock make the total capital liabilities $20,542,600. The plan is to permit the company to earn 5 per cent on common stock at a 7-cent fare, 6 per cent on a 6-cent fare, and 7 per cent on a 5-cent fare. Thus it is in the interest of the company to maintain the lowest fare possible.

It is estimated that the $900,000 to be spent on improvements will materially lower the company's operating cost, with the possibility thus of reaching the minimum fare. In case the "barometer fund" goes over $500,000 on the minimum fare, the surplus will be divided three ways: One-third to the company, one-third to employees and one-third to the city. Employees are also taken into consideration in the spending of the $900,000 for improvements. Some of this money will go for rest-rooms and other conveniences.



LOUISVILLE "TIMES" SEES FARE SETTLEMENT IN SIGHT AT LAST

Public hearings will be held on the ordinance before it is acted on by the Council. The Council will then take it up. Within ten days after its passage, company stockholders will vote on its acceptance. President Barnes seems pleased with the ordinance and it is generally expected that all concerned will find it satisfactory.

Tacoma Considers Use of Weekly Pass

Members of the City Council of Tacoma, Wash., will be addressed by Walter Jackson, street railway expert, who is making a survey of the Tacoma railway system. It is expected that Mr. Jackson will explain to the Council in detail the pass system suggested by him for use on the lines of the Tacoma Railway & Power Company.

A preliminary conference was held recently by Mayor A. V. Fawcett, Frank R. Spinning, state supervisor of transportation, department of public works, Mr. Jackson and J. Charles Dennis, city attorney. The whole matter now rests on the price for these passes submitted by the Tacoma Railway & Power Company, according to Mayor Fawcett, and this price cannot be determined until Mr. Jackson completes his survey of the entire transportation system.

Mr. Spinning expressed the opinion that if the price for the pass is right, its use would be the best thing for the city. Mayor Fawcett, while still holding to the hope of a 5-cent fare for the city, stated that he could see where the pass system might be of benefit to working men who would use it regularly every day and who could then turn it over to some other member of the family for use during the evening.

In an interview which he gave to the Tacoma *Times* shortly after his arrival in that city Mr. Jackson is quoted as saying:

> I am not absolutely certain that the weekly pass system would do for Tacoma. I believe, however, that conditions here are favorable. All street railways have one failing in common—the tremendous waste of service. The Tacoma street railway, I have found, is no exception.
>
> The problem, I believe, is to make the street railway more of a business than an industry, to sell more rides to the people, to sell them by way of the weekly pass so that people may ride more economically and ride when they want to ride. I believe the weekly pass quickens the entire life of the city, improves business, and is more popular with the people than the straight fare system.
>
> Though I have been in Tacoma before, I put in Sunday walking all over the city. I first want to put myself in the position of the citizen who patronizes the street railways. I have not gone into any of the figures with Richard T. Sullivan, the local manager, as yet, but I will do all that later.

People Vote for Railway Service

By popular vote of more than four to one, Sault Ste. Marie, Mich., decided that it could not get along without street railway service. At an election held on June 26 it freed the Sault Ste. Marie Light & Traction Company from the franchise obligation of paving between tracks and thus made it possible for the cars to continue in operation.

Three years ago the company was taken out of a receivership and during that time fell more than $17,000 short of operation costs in its total gross revenue. Recently, it was decided to resurface the main business thoroughfare of the city, and according to the ancient franchise the company was informed its share would be about $5,000. The company informed the city that the money was not on hand and that the operation losses had ruined the company's credit. No legal means of relief was available, so the company went before the Michigan Public Utilities Commission and asked the right to suspend operations entirely.

The commission granted the company's request, effective on July 15, provided that no means of relief appeared before that date. The city then called a special election to permit the voters to express themselves. When the ballots were counted, it was found that 1,023 persons had voted to relieve the company from paving as against 223 opposed. Sixty per cent was needed.

Plan Under Way

Committee Has Several Undertakings in Prospect — Cincinnati Traction to Be Reorganized

A reorganization of the Cincinnati (Ohio) Traction Company, scaling down of the capital and the dissociating of the company from all other contributory companies not directly interested in the operation of an electric railway system are some of the things to be undertaken by members of Mayor George Carrel's street and railway committee formed on June 27. Mayor Carrel has already announced his plans to the committee. The movement for an investigation of the traction situation has been on since the beginning of the Carrel administration.

It is the aim of the municipal officials to bring about an arrangement whereby the city will deal only with one company directly. It is believed that the City Council will work hand in hand with the street railway committee for a one-way street plan which will fit in with the decisions of the traction arrangements. Traction company officials have expressed their willingness to co-operate with the Mayor's committee. The committee named by Mayor Carrel really is a combination of several committees which will work as one body, combining the ideas of each unit.

Besides the general citizens' committee there will be representatives named by organizations. Another unit will be made up of city officials; this unit will be headed by Mayor George Carrel.

COUNCIL WILL BE REPRESENTED

Frank Duttenhofer, chairman of the street railway committee of Council, and Councilman Clifford Martin will represent City Council. During the wind-up of the administration of the late Mayor John Galvin the traction situation became acute and a traction committee was named by the Mayor. The new franchise ordinance was drawn up by the Galvin committee and the financial reorganization phase of the traction problem extended over into the present administration.

The appointing of the committees and the work which is to follow are the outgrowth of a letter sent to W. Kesley Schoepf, president of the company, by city officials on Jan. 1 of this year. In this letter it was said by the officials that a readjustment and scaling down of capital and a reduction of fixed charges in the minds of the officials would do a great deal to help the situation. It also was said that a readjustment or consolidation of the companies now involved in the traction system should be brought about so that the city could deal directly with one organization.

Mr. Schoepf consented to the plan of the city officials and the action of Mayor Carrel put the entire affair upon an active basis.

At the organization meeting of the committee, Mayor Carrel was designated chairman; Edward J. Dempsey, vice-chairman, and Mrs. Wilmer Crawford, secretary. Walter Draper, vice-president of the Cincinnati Traction Company, was present, as were Rufus B. Smith and Robert Taft, who represented the Cincinnati Street Railway. General plans of the committee were discussed, and while no definite action was taken it was decided that the enormous task which confronted the mayor's organization would be gone into at once. Night meetings are to be held and no time is to be wasted in working out the various phases of the situation.

Mr. Draper said that his presence was for the purpose of informing the committee that the traction company would be only too glad to furnish complete and full data desired by the members. Mr. Draper gave a sort of résumé of the affairs of the Ohio Traction Company, Cincinnati Car Company and Cincinnati Street Railway.

Franchise for New Interurban in Prospect

Promoters of the Houston & Bayshore Interurban, which is to extend from the City of Houston, Tex., down the Houston Ship Channel to the shore of Trinity Bay, thence around the bayshore, touching the various resorts, and summer colonies, have reached an agreement with the City Council over the form of franchise that will be granted. The promoters and the city had been in a controversy that appeared for a time as likely to disrupt plans to the extent of causing promoters to call the project off. The franchise is being sought by John H. Kirby, wealthy lumber man of Houston, under an agreement to transfer it to a company to be organized, the first directors of which shall be himself, John S. Bonner, Houston oil man, and W. C. Munn, Houston merchant. Col. J. F. Wolters is attorney for the promoters.

Under the agreement, the city of Houston will grant a franchise for the line, including permission to use the tracks of the Galveston-Houston Interurban. The total mileage will be 37 miles and an extension into Texas City to connect with an hourly ferry service into Galveston is contemplated soon. Construction must start by March 1, 1923.

Chicago Men Voting on Wage Cut

Union conductors and motormen of the Chicago Surface Lines were expected to vote during the week ended July 8 on the question of accepting the proposal of the management for a reduction in wages. The terms of the offer were kept secret, the only announcement being that labor would have to stand the greater part of a $9,000,000 cut in operating expenses made necessary by the loss of revenue under a 7-cent fare. A committee representing the company and the men has been in session for several weeks considering how the situation can be helped.

$462,395 for Improvement

Half Million Will Be Spent by Dallas Railway in Return for Six-Cent Fare Extension

The city of Dallas, Tex., and the Dallas Railway have settled the controversy involving the extension of the 6-cent fare and the expenditure by the company of approximately $500,000 in extensions and betterments. The city has agreed to extend the 6-cent fare for a period of one year from June 27, and in return the railway has agreed to expend approximately $500,000 within a period of eighteen months in improvements, betterments and extensions, as directed by the city authorities.

COURT ACTION WAS THREATENED

The settlement followed what had appeared to be an inevitable break between the city and the company. The city had threatened to relicense jitneys and permit them to operate unhampered as a club with which to whip the company into line. On the other hand, the officials of the company had threatened to bring action in Federal Court seeking relief from what they termed confiscatory fares.

The ordinance providing for the extension of the 6-cent fare was based on a report by Supervisor of Public Utilities J. W. Everman, submitted on June 17, in which the officials of the railway set forth what they agreed to do in the way of extensions and betterments.

The improvements are divided into three groups. The first group includes the Lindsley Avenue extension from Stonewall Street to Christler Avenue in connection with the Forney Avenue line to be built by the Texas-Interurban Company for the Terrell Interurban, as set out in the Everman report, estimated to cost $110,000; the rebuilding of Lamar Street from the Santa Fé Railroad to Alexander Avenue, paving of intersections and parking of the balance of track, estimated to cost $30,000, and the Haskell Avenue extension from State Street to Cole Avenue at the North Dallas High School, estimated to cost $50,145.

OAK CLIFF LINE

The second group includes the Oak Cliff cross-town line, estimated to cost $11,000; rebuilding of the Live Oak Street tracks, estimated to cost $60,000, and rebuilding and paving of Forest Avenue between Meadow Street and Second Avenue, estimated to cost $35,000.

The third group includes a single track extension on Second Avenue to the T. & N. O. Railroad, estimated to cost $15,000; the Myrtle Street extension, estimated to cost $15,000; rebuilding and paving of Knox Street from Cole Avenue to the M., K. & T. Railroad, estimated to cost $19,000, and rebuilding and paving of Munger Avenue between Peak and Haskell Avenues, estimated to cost $16,980.

While the total cost of these improvements will amount to from $30,000 to

$60,000 more than the funds available for improvements and extensions during the coming year, according to estimates of both the city and the company, the company nevertheless agrees and obligates itself to make these improvements within eighteen months, regardless of business conditions or the amount of its revenues.

In the proposal accepted by both the city and the company the company states that:

> We believe that operating costs during the next eighteen months will be so heavy that as a matter of justice to the company the 6-cent fare should continue at least during the eighteen months period of construction, but inasmuch as your honorable body has indicated an unwillingness to continue said fare for a longer period than twelve months at a time we accept twelve months' extension, relying upon the sense of fairness and justice of the Board of Commissioners again to extend the said 6-cent fare if conditions twelve months from now warrant such extension.

The company further agrees that it will not request or permit any part of its earnings, during the year the 6-cent ordinance is in force, to be applied to the payment of the past deficit on its 7 per cent authorized return. This was the issue over which the controversy originally started in March, when the company sought to apply $111,000 surplus to payment of back dividends, and Mayor Aldredge insisted the surplus should be used for improvements and extensions. The $111,000 surplus was returned to the treasury.

The ordinance extending the 6-cent fare for a period of twelve months from June 27 and embodying the proposal as accepted by the city and company was passed by the Board of Commissioners under an emergency clause.

Work on the improvement called for under the agreement will begin at once, according to W. M. Holland, president of the company.

In consideration of the city continuing the 6-cent fare ordinance for a maximum period of twelve months from June 27, 1922, the railway has formally agreed to make, within a period of eighteen months from June 27, 1922, the following improvements:

PROGRAM OF IMPROVEMENTS

	Estimated Cost.
First Group	
Lindsley Avenue extension from Stonewall Street to Cristler Avenue in connection with the Forney Avenue line to be built by Texas Interurban Ry. Co. as set out in Everman Report	$110,000
Bebuilding Lamar Street from Santa Fe Railroad to Alexander Avenue, paving intersections and parking balance of track.	30,000
Haskell Avenue Extension	
Second Group	
Oak Cliff cross-town line	111,000
Rebuilding Live Oak Street tracks	60,000
Rebuilding and paving Forest Avenue between Meadow Street and Second Avenue	35,000
Third Group	
Single track extension on Second Avenue to T. & N. O. Railroad	15,000
Myrtle Street Extension	15,000
Rebuilding and paving Knox Street from Cole Avenue to Katy Railroad	19,000
Rebuilding and paving Munger Avenue between Peak and Haskell	16,980
	$462,395

One-Man Cars Operate

Commissioner Hopes New Type Will Reduce Toledo Expenses—Lower Fares the Objective

Following the approval of the Mayor and several members of his cabinet the new converted one-man cars were placed in operation by the Community Traction Company, Toledo, on the Bancroft Belt line on July 1. The city officials, with Street Railway Commissioner Wilfred E. Cann and newspaper men, made a trial trip in one of the cars earlier in the week.

OLD CARS BEING CONVERTED

Ten of the old 600-type cars were fitted with turnstiles at rear door, new dead-man type controller, several new seats, watt-meters, and fare boxes placed at the left of front door. The cars were also repainted and thoroughly overhauled. At the conclusion of the trial President Frank R. Coates announced that sixty of the same type of cars would be converted into one-man cars and put into operation on a number of lines. The operators are given 55 cents an hour for operation of this type of car—an advance of 5 cents an hour above the maximum for all other platform men.

In speaking to a group of business men recently the commissioner said that independent buses had taken away from the car lines about $400,000 in the last sixteen months during which time the Milner service-at-cost ordinance has been in effect. He said that $100,000 in added street car service would easily have provided equivalent service to what the buses added and that would have left $300,000 to go into the fare stabilizing fund. The result, he said, would have been lower fares at the present time.

Many Passengers Overcome by Fumes in Subway

About 150 passengers on a ten-car Jerome Avenue express train of the Interborough Rapid Transit Company, New York, N. Y., were partially asphyxiated on July 6 when gas swept through the train, stalled by a short circuit in the Lexington Avenue subway, about 100 feet below the street and just north of Fifty-ninth Street. Although ninety persons were reported by the police as receiving medical attention, only two of the twenty who remained in hospitals on the night of July 6 were in serious condition.

Both the railway and the New York Transit Commission are investigating the causes which led up to the accident. Both the railway and the commission agree, however, from their initial studies of the matter that a short circuit developed in a car near the middle of the train in the left hand forward corner of the car where the electrical apparatus is enclosed behind the metal panel. The arc which developed was so intense that it destroyed all the switches, wiring, terminals, connections and insulation. The Pyrene fire extinguishers with which the car was equipped were used to put out the fire, but the smoke generated by the burning insulation, together with the fumes from the fused metal, more or less confined by the circumstances, resulted in a number of people being overcome.

In the report of the Transit Commission the statement was made that the injury caused by the smoke was "possibly augmented by the fumes from the chemcials of the fire extinguishers," and the same charge was made more directly by city officials.

Passengers made their way to the street through the emergency exits leading to the sidewalks.

A statement by Frank Hedley, president of the company, follows in part:

> It is impossible to determine just what caused the short circuit to start, because everything was destroyed; the smoke came from the burning insulating material together with vapors of the metals which were fused; the train crew acted promptly in causing the power to be shut off, and it was kept off for nearly two hours in the interest of the safety of passengers so that by no possibility could any trains be moved into the zone affected by the smoke and so that no further short circuits might be caused upon the stalled train; when everything was found to be safe the power was restored.
>
> The train was provided with Pyrene fire extinguishers, which were used by the train crew in an effort to subdue the flame and prevent the smoke, but without success, as the arc was too intense; it is a mistake to place the cause of the smoke upon the fire extinguishers; they are standard everywhere and are approved by the Fire Underwriters' Association and by the United States Government. The electrical apparatus which short-circuited was inspected and tested last week and found in good order in every respect.
>
> While such short circuits have happened before, they have always been checked before any considerable noxious vapor developed; we have already started our electrical and other technical men making studies to see what if any improvements can be devised to prevent a recurrence of such an event. I regret very much the trouble and suffering caused to the passengers and I hope that no serious injury may result after the immediate effects of the fumes pass away. If further investigations develop any new facts they will promptly be made public by me.

The commission said:

> Our engineers and experts are investigating the accident. Until their reports are received the commission will not undertake to determine what additional safeguards, if any, it is possible to devise and install in the subway to prevent accidents of this character.

No Attempt Being Made to Circulate Franchise Petitions

Recently a franchise was offered to the Council of Saginaw, Mich., for presentation to the electors, but the Council declined to submit it unless the citizens' committee, which had sponsored the plan in conjunction with the receiver of the Saginaw-Bay City Railway, presented a sufficient number of signatures to the Council to call for an election. This position was taken by the Council although the election would not have cost the city a dollar as under the state constitution all public utility franchise elections must be paid for by the company asking for the contract. As yet the petitions have not been presented although the committee received the decision from the Council several weeks ago. As far as is known, no attempt has been made to circulate them.

Financial and Corporate

Successor Organized

Final Details Carried Out in Reorganization of Third-Rail Line Out of Chicago

The final steps in the reorganization of the Third-Rail Division of the Aurora, Elgin & Chicago Railroad were taken on July 3 with the delivery of the deed of this property to the Chicago, Aurora & Elgin Railroad and the election of permanent officers and directors of that company.

The officers of the new company are: Thomas Conway, Jr., president; Edwin C. Faber, vice-president; J. H. McClure, vice-president and general manager; Gordon B. Anderson, treasurer, W. D. Turner, secretary, and Alfred E. Pfahler assistant secretary, and B. P. Alschuler, attorney for the company.

The board of directors of the new railroad consists of Thomas Conway, Jr., chairman of the board; F. G. Adamson; George E. Hunter; Frank W. Renwick; Lewis B. Williams; Alfred E. Pfahler; W. D. Turner; E. C. Faber and B. P. Alschuler.

MANY DIRECTORS LOCAL MEN

A majority of the members of the board of directors are prominent local citizens representative of the communities served by the property. Fred G. Adamson is with the Stephens-Adamson Company, Aurora; George E. Hunter is superintendent of the Elgin National Watch Works; Frank Renwick, Geneva, Ill., is president of the Chicago Gravel Company; Lewis B. Williams is a member of the firm of Hayden, Miller & Company, Cleveland, Ohio, is a director of the Federal Reserve Bank of Cleveland, and is a director and treasurer of the Nickel Plate Railroad; W. D. Turner is a member of the firm of M. B. & H. H. Johnson, Cleveland, Ohio, and served as counsel for the bondholders protective committee throughout the receivership and reorganization; A. E. Pfahler resides in Philadelphia and represents an extensive group of investors in Pennsylvania and New England.

The directors voted to authorize the creation of a new mortgage and for the immediate issuance and sale, subject to the approval of the Illinois Commerce Commission, of $1,050,000 of bonds thereunder, the proceeds of which will be used to finance the new construction work.

The stone ballasting of the main line from Chicago to Wheaton was authorized. This work is already under way, several miles of line having been put in shape in and near Maywood.

Extensive improvements in the power plant were authorized which will effect further economies in the generation of power.

The board authorized extensions to be made to the Wheaton car shops necessary to take care of the growing volume of maintenance and inspection work on the equipment, required by the growing traffic of the company.

Construction of a new freight house in Aurora to be located on North Broadway was also authorized.

The purchase of twenty new all-steel cars was authorized by the board and negotiations are now in progress for placing the order for this equipment.

An extensive program for increasing substation capacity was also authorized, providing for the erection of two new substations and for extensive changes in the existing substations.

The completion of the improvements authorized by the board of directors will enable the company to give a standard of service never heretofore possible.

Extension of Time in Pittsburgh

C. K. Robinson, special city solicitor at Pittsburgh, Pa., in charge of public utility legislation, has received official notification of the approval by the Public Service Commission of a petition requesting an extension of time for the appointment of a traction conference board for reorganization of the Pittsburgh Railways as provided in the agreement which has been reached by the city, the railway and the Philadelphia Company.

Under the terms of the agreement, the board should have been named not later than June 1. The date has been extended to Aug. 1. Four boroughs have approved the reorganization agreement, Mr. Robinson said, and others are considering it. The board will be appointed after each borough and city outside of Pittsburgh has taken action. Mr. Robinson said that the necessary legal steps to terminate the receivership probably would be taken by July 1.

Eliminates Duplication of Service

The Tenth Street car line, owned and operated by the Idaho Traction Company, will be abandoned, and the Eighth Street line, owned by the Boise Railroad, will be turned over to the former company, under the terms of an arrangement which has just been made by officials of both companies and the Mayor and City Council. This move, officials explain, is made with the view of eliminating duplication of service by both lines. Under the terms of the agreement the Idaho Traction Company assumes the liabilities of the Eighth Street line and turns over to the Boise Railroad approximately six blocks of rails and ties now in use on Tenth Street.

Another Reorganization

Peru Division of Winona Road Will Become a Separate Company—Prospects for Success Bright

The Goshen Division of the Winona Interurban Railway, Winona, Ind., is to be reorganized separately from the Peru Division. This course has been decided upon following conferences with representatives of the holders of the bonds of the Peru division. In the opinion of the committee representing the holders of the first mortgage bonds secured by the Goshen division, the relative earnings of the two divisions of the company have been fairly definitely established and it now seems clear that no plan of financial reorganization of the two divisions as a whole could be devised which would equitably recognize the larger earning power of the Goshen division.

The Winona Interurban Railway was placed in the hands of a receiver on July 24, 1916, upon application of the First Trust & Saving Bank, trustee, representing the holders of the first mortgage bonds secured by pledge of the property of the Goshen Division. Since then the accounts of the two divisions have been kept separately. Prior to the receivership, $700,000 of the authorized issue of $750,000 of bonds had been sold, with the other $50,000 pledged as collateral for loans. The loan covered by the bonds pledged as collateral was not repaid so the collateral was foreclosed, making $750,000 of bonds outstanding.

The Goshen Division will be foreclosed and title conveyed to the Winona Northern Railway, which will have an authorized capital stock of $750,000. It will issue $572,500 of stock and $187,500 of 6 per cent twenty-year first mortgage bonds in payment for the property. Under the terms of the proposed reorganization each holder of $1,000 of bonds of the Goshen division who accepts the plan will receive in exchange for his bond fifteen shares of stock of a par value of $50 and $250 in bonds. Upon completion of the reorganization of the Goshen division bondholders will have received $187,500 of bonds and $572,500 of capital stock in lieu of the bonds now held. The cash in the receiver's hands assignable to the Goshen division will be used for working capital and to pay the expenses of the reorganization.

Heim Interests After Belt Line

The Kansas City-Outer Belt Railway may be sold to J. J. Heim and other interests owning the Kansas City, Kaw Valley & Western Railway, an electric railway. Mr. Heim's agents were high bidders at the sale of the Outer Belt on June 28, but the sale is held up ten days at the instance of the bondholders. If the sale is confirmed the Outer Belt will be made an electric railway for terminal and industrial district service. Construction of the road was started about seven years ago, but the line was never completed.

New Expert to Testify

M. R. Maltbie Will Assist D. F. Wilcox in Minneapolis Valuation—Report Shows Possible Savings

The City Council of Minneapolis, Minn., on June 30 authorized city attorney Cronin to engage the services of Milo R. Maltbie of New York to assist in the valuation of the Minneapolis Street Railway. Dr. Maltbie will assist Delos F. Wilcox, the city's present valuation expert, at the coming hearing before the Minnesota Railroad & Warehouse Commission for the determination of a fare that will make a fair return on the company's investment.

EXPERT ESTIMATES INCOME

Dr. Wilcox on June 23 made a report to the Council pursuant to a recent resolution instructing him and the city attorney, Neil M. Cronin, to make a plea before the commission for a lower rate of fare than the 6 cents straight now prevailing. It shows the saving to patrons resulting from reductions down to the old rate of 5 cents straight.

The estimated present income under the 6-cent fare is annually $2,502,653, 6 per cent on an investment of $41,710,899, or 8 per cent on $31,238,174, 12 per cent on $20,855,449 and 16 per cent on $15,641,587. A reduction of 1 cent in fare would mean a drop of $1,359,977 in passenger revenue to the company, while a one-fourth cent reduction would mean a loss of $339,874. On the other hand a 6-cent cash fare with four tickets for 22 cents, or an average of 5.6 cents per passenger, would return an operating income of $1,956,855, a return of 6 per cent on $32,647,590 or 14 per cent on $13,991,824. A 6-cent cash fare with five tickets for 25 cents, an average of 5.1 cents per passenger, would return an income of $1,279,107, or 6 per cent on $21,318,461, or 9 per cent on $14,212,307. A straight 5-cent fare would bring in an income of $1,143,157, or a return of 6 per cent on $19,071,929, or 8 per cent on $14,289,471. This is on the basis of 1921 passenger traffic and revenue.

ADJUSTMENTS CONSIDERED TO BE NECESSARY

According to the report certain adjustments should be made not contained in the emergency report of last August to the commission relating to distribution of interest, depreciation and taxes as an element in the cost of power and shop work; elimination of expenses operating the Fort Snelling extension and the Columbia Heights extension, the latter in Anoka County, and the former in Hennepin County, but on the government reservation. Under the theory of the Brooks-Coleman act these latter expenses must be eliminated as the fare to be fixed must be based on operation and valuation of property within the city limits.

The report reads in part:

> Conditions have radically changed since last year. The neutral zone has been abolished and the 50-50 rule of division in intercity lines abandoned, resulting in a large increase in the gross revenue and net operating income of the Minneapolis Street Railway. Wages of employees were reduced at the beginning of the current year an average of approximately 12 per cent. The number of car-miles run in proportion to the number of passengers carried has also been reduced.
>
> To arrive at a reasonable approximation of the company's true annual operating income under conditions that will prevail when the valuation is determined and the permanent fare fixed, I have taken the net operating income for the first five months of 1921 and have found what proportion it is of the total operating income for the full year of 1921. I have then taken the net operating income for the first five months of 1922 and have estimated for the full year 1922 using the same proportion.
>
> The total annual passenger revenue of the Minneapolis Street Railway under the 6-cent fare, and the amounts by which this revenue would be reduced with the average fare paid lower than 6 cents, are approximately as follows:

Passenger revenue as reported by company for 1921	$7,927,173
Addition by adjustment of intercity line division	229,804
Revenue on a 6-cent fare	$8,156,977
Reduction of 1 cent	1,359,496
Reduction of 9/10 cent	1,223,547
Reduction of 3/4 cent	1,019,622
Reduction of 6/10 cent	815,698
Reduction of 1/2 cent	679,748
Reduction of 4/10 cent	543,798
Reduction of 1/3 cent	453,165
Reduction of 1/4 cent	339,874

Sale of Collateral Ordered

Judge Julius M. Mayer has ordered the sale at public auction of 339,128 shares of capital stock of the Interborough Rapid Transit Company, New York, N. Y. The order was issued on petition of the Empire Trust Company, as substitute trustee and successor to the Windsor Trust Company, James R. Sheffield as trustee in bankruptcy for the Interborough Consolidated Corporation, and committee of bondholders.

The sale, it was explained, is designed to eliminate the Interborough Consolidated and its bondholders, who will become stockholders in the Interborough Rapid Transit Company. This conversion, effected legally through the sale of the stock, will simplify subsequent transactions involving the finances of the Interborough companies. Ninety per cent of the bonds have already been deposited. The sale was ordered for not earlier than Aug. 1.

The certificates are held by the Empire Trust Company as collateral for a bond issue amounting to $70,000,000, under a trust agreement of March 5, 1906, made by the Interborough-Metropolitan Company, the predecessor to the Interborough Consolidated Corporation, to the Windsor Trust Company, for which the Empire Company is now acting.

Of these bonds $63,808,600 are now outstanding, and are due and payable as a result of the bankruptcy. Interest charges in addition to this amount, are $11,362,158, making total debt on bonds plus interest $75,170,758.

Bonds of the Interborough-Metropolitan amounting to $4,017,000 held by Mr. Sheffield were ordered surrendered to the Empire Trust Company for cancellation.

Judge Mayer appointed Mr. Sheffield to act with the trust company as special master in the sale.

$120,000 Involved in Power Dispute

Judge Kimbrough Stone has authorized Francis Wilson and Fred W. Fleming, receivers of the Kansas City Railways, to sell the surplus energy of the railways power plant and any additional surplus which might be produced above the company's requirements at a price which in their opinion would be profitable to the railways "estate."

An additional order, permitting the receivers to sue the power company for $120,000 or such amount as they considered due the railway under the old "stand-by" agreement, has also been granted by Judge Stone. The receivers, it is set out in the order, might adopt the alternative of submitting testimony in the "stand-by" litigation to John T. Harding, special master, for settlement.

The railway and the Kansas City Power & Light Company, which prior to 1916 were one, were divorced by order of Judge Hook. The railway then entered into a contract with the power company to furnish it current. In April, 1921, the old contract between the companies expired. An agreement, known as the "standby," was made at that time, according to James E. Goodrich, counsel for the receivers.

Under the terms of the agreement, Mr. Goodrich said, the light company was to pay to the railway $10,000 a month for twelve months for the assurance of the railway that in the event of a breakdown at the power company's plant, the railway would be prepared to furnish 10,000 kw. an hour. The energy used in event of a breakdown, was to be paid for at an agreed rate in addition to the $10,000 guarantee.

Surface Line Valuation Figures Presented

Valuations of their properties more than double those of the engineers of the Transit Commission were submitted on June 29 for the Eighth Avenue Railroad and the Ninth Avenue Railroad. These surface lines were formerly part of the New York Railways under lease and are now operated by their owners.

The Eighth Avenue Railroad estimated the value of its property at $8,862,159, on the basis of cost to reproduce new at 1919 prices. The estimate of the commission's valuation bureau was $1,350,000 for "property used in operation" on the basis of "original cost less cost to put in first-class condition." More nearly comparable with the company's figures was the Valuation Bureau's estimate of $3,732,226, on the basis of cost to reproduce at 1921 prices, with $11,969 additional for property not used in operation.

The Ninth Avenue Railroad estimated the value of its property on the 1919 cost to reproduce basis at $6,121,133. The commission's "original cost" estimate was $1,269,470 and its estimate on the basis of 1921 reproduction cost was $3,002,249 with $22,959 additional for property not used in operation.

Financial News Notes

New Twin City Director.—W. O. Washburn, managing director for the American Hoist & Derrick Company, St. Paul, Minn., has been elected a director in the Twin City Rapid Transit Company to succeed W. A. Read, deceased.

Protective Committees for Ithaca Issues.—A committee of bondholders is now being formed for the purpose of protecting the interests of the holders of the following three issues: $175,000 of Ithaca (N. Y.) Street Railway first mortgage 6's due July 1, 1922; $75,000 of Ithaca Street Railway second mortgage 6's due July 1, 1922, and $25,000 of Cayuga Lake Electric Railway first mortgage 6's due June 1, 1922.

Announces Bond Issue.—The Georgia Railway & Power Company, Atlanta, Ga,. has made application to the State Railroad Commission for authority to issue $3,500,000, par value, twenty-five year 6 per cent general mortgage gold bonds. The bonds are to be dated April 1, 1922, and are to mature April 1, 1947. The proceeds are to be used in paying for extensions and improvements.

Income for Eleven Months Reported.—For the eleven months ended May 31, 1922, the Brooklyn (N. Y.) Rapid Transit System reports a gross income of $10,939,493 against $3,375,404 for the eleven months' period ended May 31, 1921. With total income deductions amounting to $8,124,110 the net income for the 1922 period was $2,815,383 against a deficit a year ago of $5,045,791.

Another Dividend at Worcester.—The directors of the Worcester (Mass.) Consolidated Street Railway have declared a semi-annual dividend of $2.50 per share on the preferred stock payable on July 1 to holders of record of June 20. This is the second distribution on the preferred shares since December, 1917, and reduces the dividends in arrears to $17.50 per share. A like amount was paid in April last.

Tracks to Be Abandoned.—The receivers of the Pittsburgh (Pa.) Railways have received permission to enter into a contract with the city to abandon the tracks on St. Clair Street and Euclid Avenue. At the same time the receivers will be allowed to resume operation of the streets after twenty years. It is claimed that the tracks are very little in use, the one car being operated to maintain the franchise obligation of the Highland Park Passenger Railway, a subsidiary of Pittsburgh Railways.

Low Yield on Refunding Issue.—Dillon, Read & Company and Tucker, Anthony & Company, New York, N. Y., are offering the unsold balance of $2,059,000 Manchester Traction Light & Power Company first refunding mortgage sinking fund gold bonds, at 93¾ and interest, to yield about 5.40 per cent. The bonds, dated Aug. 1, 1917, are due Aug. 1, 1952. The company owes and operates hydro-electric power plants in Manchester and Nashau, N. H., and nineteen surrounding towns.

Railway Pays Debt.—The War Finance Corporation announced recently that the Commonwealth Railway, Power & Light Company, Grand Rapids, Mich., has repaid its entire remaining indebtedness to the corporation, in the amount of $2,216,000. This represents the anticipation of indebtedness outstanding under two advances, one of $676,000 maturing Nov. 1, 1922, and one of $1,540,000 maturing May 1, 1923. The government advanced $4,800,000.

Non-operating Lines Sold.—The Norfolk & Bristol Electric Railway, operating 22 miles between the two towns of that name in Massachusetts, has been purchased by Samuel Krueger, vice-president of the Capital City Trust Company, Trenton, at a receiver's sale recently. The line, which has not been in operation for more than a year, touches Norwood, Mansfield, Wrentham and East Walpole. Mr. Krueger says that if he does not find a suitable purchaser who wants to put the line in operation he will dismantle the road.

Sale Postponed.—The sale at public auction of the Pottstown & Phoenixville Railway, Pottstown, Pa., by the Norristown Trust Company, has been postponed until July 24, at one o'clock in the Court House, Room No. 2, at Norristown, Montgomery County, Pa. No bid for less than $75,000 will be entertained. Prospective bidders in order to qualify must deposit a certified check for $1,000 with the Norristown Trust Company, trustee, one day before sale. The sale had been previously announced for June 29.

Favors Discontinuance.—The City Commission of New Brunswick, N. J., has adopted a resolution granting permission to the Public Service Railway to discontinue service on the Burnet Street branch, from Neilson and Albany Streets to the Raritan River steamboat dock. The tracks will be torn up immediately. It is believed that the Board of Public Utility Commissioners will grant the application of the railway for the abandonment of this line. The Burnet Street line has been unprofitable for many years.

Receivership Order Signed.—By a recent order of Judge Julius M. Mayer in the United States District Court the authority of Job E. Hedges, receiver of the New York Railways, has been extended to include the Sixth Avenue Railroad. Heretofore this road was not included in the receivership of the New York Railways. The road had asked that it be made a party defendant in the suit brought by the American Brake Shoe & Foundry Company. H. V. Poor, counsel for the road, said that the order was made by Judge Mayer for technical and financial reasons and in no way affected the present operation of the Sixth Avenue line.

$1,200,000 Short-Term Loan for New Orleans.—The New Orleans Railway & Light Company, New Orleans, La., has arranged for a short time loan at 7 per cent, it was revealed, when Judge R. E. Foster of the United States District Court granted the petition of Receiver J. D. O'Keefe for the issuance of $1,200,000 of receiver's certificates. The loan was made by the Girard National Bank, Philadelphia. It is to run for six months from June 1. The receiver said the fund would be used in paying for the 20,000-kilowatt generator unit being added to the Market Street power plant, and for the re-enforcement of the electric distributing system.

Foreclosure May Follow.—Sale under foreclosure may follow default by the Concord, Maynard & Hudson Street Railway, Maynard, Mass., on July 1 of the principal of the $230,000 of first mortgage bonds. The receiver of the company is D. P. Abercrombie. He was named for that post on Dec. 20, 1921, by a decree of the Supreme Judicial Court of Massachusetts. A committee of bondholders headed by A. F. Drummond, treasurer of the Waterville Savings Bank, Waterville, Me., is seeking a deposit of the bonds under a deposit agreement. It is reported to be the intention of the committee to ask the trustees to intervene in the receivership proceedings with a possible view to sale under foreclosure.

Extension of Bonds Underwritten.—The North American Company, New York, N. Y., controlling the United Railways, St. Louis, Mo., has underwritten an extension of the bonds of the Cass Avenue & Fairgrounds Railway. The holders of the $1,640,000 of first mortgage extended 4½ per cent bonds of that company due on July 1, 1922, are to be permitted to extend their bonds with the present mortgage security so that they will mature on Oct. 1, 1923, the principal to be then payable at the office of the Mercantile Trust Company, St. Louis. The bonds as extended are to bear interest at the rate of 6 per cent. The principal and interest on the bonds as extended are to be unconditionally guaranteed by the United Railways.

Reorganization Details Being Arranged.—Federal Judge George W. Ray, at Binghamton, N. Y., has issued an order allowing William G. Phelps, as receiver, to approve of an offer from H. S. Fleming, New York, for the entire issue of Series "A" Binghamton Railway bonds, amounting to $700,000 to be sold to finance and reorganize the corporation. The directors of the railway had previously voted approval. Thomas J. Keenan, one of the attorneys for the road, is now preparing an appeal to the Public Service Commission for approval of the offer so that the entire program for reorganization of the company may go through. Argument of a motion made several months ago by the Fidelity Trust Company, Buffalo, N. Y., that the receiver be discharged and the property sold to the highest bidder, was postponed indefinitely.

Traffic and Transportation

Fares Cut in Albany

Order of Commission Advances Rates, However, on So-Called Troy Zone —Company Accepts Order

The Public Service Commission on June 30 announced that it had fixed a uniform rate of fare in all zones of the United Traction Company, Albany, N. Y., at 7 cents. This ruling reduces the fare rate in Albany from 8 to 7 cents, and increases the rate in municipalities in the Troy zone, including Troy, Cohoes and Rensselaer, from 6 to 7 cents. The order took effect July 6.

The 7-cent fare in all zones of the United Traction Company follows the decision of the commission upon the petition of the company for an 8-cent fare. It follows a number of hearings before Chairman Prendergast in which the operation conditions of the company were reviewed to May 1, 1922.

FAIR RETURN ALLOWED

The 7-cent fare will give the company a return of 8 per cent upon a property valuation of $5,850,000. This is $3,150,000 less than the claimed value by the company of the property used by it in giving transportation service in the Capitol district. The estimate of the company for 1922, submitted on the hearing, based on present fare rates, showed a deficit of $195,338 for the year, and based on the 8-cent fare or four tickets for 30 cents there would be a net income of $61,330. The decision of June 30, the commission figures, will give the company a reasonable return based on a valuation of $5,850,000.

The evidence presented at the hearings showed that riders in the Troy zone were not entitled to a lower rate than riders in Albany. It was also shown that operation in Albany cost a little less per car mile than in Troy, while the revenue in Albany at the present rate is much greater and will continue to be greater under the new rate. The evidence disclosed that profits of operation in the Albany zone were applied to losses in operation in the Troy zone.

The new 7-cent fare arrangement will result in a reduction in the number of zones, leaving two local zones as described in the order of June 30, and one through zone, the 7-cent fare to prevail in each local zone and a 14-cent fare in the through zone. It will abolish the separate Rensselaer zone and permit residents of Rensselaer to ride to any point in Albany, and vice versa, for the single fare of 7 cents.

Provision will also be made for the redemption at their face value of all outstanding metal tokens, or for the acceptance of such metal tokens in lieu of cash fares.

All existing transfer privileges will be continued unchanged.

The through fare between Albany and Troy will remain unchanged.

The order of the commission prescribing the new fare is to remain in effect until Jan. 1, 1923, and thereafter until otherwise ordered by the commission.

The order of June 30 abolishes the existing zones and provides for two local zones. A 7-cent fare is good from any point to any other point within each local zone. These zones are fully described in the order.

The decision ordering the 7-cent fare will affect the greater majority of the patrons of the United Traction Company as the evidence in the investigation disclosed the fact that 63 per cent of the company's revenue was in the Albany zone, while 37 per cent was in the Troy zone.

The evidence also showed that the actual railway operating revenues for the first four months in 1922 exceeded the amount estimated by the company by approximately 20 per cent, while its actual operating expenses exceeded the estimate by only 8⅓ per cent. This estimate was made before the termination of the strike and did not include all operating expenses which would have to be made by the company, there being an increase of approximately $166,000 expenses such as paving, track reconstruction, etc., in Troy and Albany. These expenses could not be foreseen at the time the estimate was made.

The order of the commission has been accepted by the United Traction Company.

Passenger Rates Inter and Intrastate Made Uniform

A reduction in the rate of passenger fare between points in Illinois and St. Louis, Mo., has been announced by the Illinois Traction System to become effective on July 15. A basis of 3 cents per mile for the interstate trip will prevail after that date, instead of the basis of 3.6 cents per mile as at present. The rate within the State has been on a basis of 3 cents per mile for some years past and the present adjustment of fares is made, according to officials of the company, in order to relieve any discrimination against interstate rates and to produce a uniform passenger tariff to apply to travel both intra and interstate. Under the new tariffs, for example, the present fare of $5.82 between Peoria and St. Louis will be reduced to $5.21.

The railway company put into effect on July 1 a reduction in freight tariffs of 10 per cent, in accordance with the recent ruling of the Interstate Commerce Commission affecting all steam and electric carriers.

Jitneys Eliminated

Commission Believes Service of United Electric Adequate—Jitneys Did Not Develop as Real Agency

To take the place of the jitney and bus service recently eliminated by the Public Utilities Commission, acting under provisions of the Joslin jitney act of the 1921-22 Legislature the United Electric Railways, Providence, R. I., will provide adequate transportation. This announcement was recently made by A. E. Potter, general manager of the company. Besides increasing the present service, the company has planned to lease buses on the several rural lines where they have been authorized by the Public Utilities Commission.

The recent act of the Public Utilities Commission practically abolished jitneys in the State of Rhode Island. Only twenty-six of the 391 applications were granted by the commission and in no case where a route was served entirely by an electric line was a bus certificate issued. On four of the routes approved by the commission there are now no transportation facilities while the other five are served only in part by trolleys.

In its decision the commission said that the jitneys during 1921 carried 17.8 per cent as many passengers as the trolleys and that the jitney revenue for 1921 was 20 per cent of the gross passenger earnings of the electric railway. It was of the opinion that the railway should have the benefit of the additional revenue "in order that the travelling public may have the benefit of improved service or a lower fare or both, which the receipt of such additional revenue would appear to make possible in the near future."

In commenting upon the present railway service the commission stated that the railway service over all or any part of the jitney routes was adequate and sufficient to meet the demands of patrons seeking transportation over such lines. The commission also was of the opinion that in the seven years that jitneys had been operating in Rhode Island there had been little if any real development as a transportation agency; that it was apparent that one new set of men after another proceeded to engage in the business; that for the most part the applicants who testified at the hearings had operated jitneys for less than two years.

In concluding the commission expressed the hope that the elimination of the competition would enable the United Electric Railways to offer cheaper transportation to the public, especially in the suburban area. The commission said that the denial of the jitney applications placed an added responsibility upon the railway to supply adequate service at reasonable rates, but the commission believed further that those who control the operation of the railway under the recent financial reorganization appreciate the responsibility they must shoulder.

Increased Rates Suspended

The Public Service Commission has suspended the proposed increase in local fares on the International Railway in Tonawanda, North Tonawanda, Niagara Falls and Lockport until Aug. 30. The commission also notified the City Council of Buffalo that it could not order a reduction in the fare charged in Buffalo from 7 to 5 cents without the facts upon which to base a decision. In the Buffalo case the commission holds that the burden is on the company to justify its present rate of fare of 7 cents or four tokens for 25 cents. The commission will hold hearings, if the city so desires, but it points out that there is at present an examination being made of the books of the International Railway to determine whether or not the continuance of the 7-cent fare is justified.

The Niagara Falls municipal authorities have engaged John C. Brackenridge, New York, expert engineer and accountant, to handle its fight against the proposal of the International to raise local fares from 5 to 7 cents or four tokens for 25 cents. Mr. Brackenridge had previously been engaged by the city of Buffalo in determining rate questions with the International. He will make a complete survey of the company's records as involves the Niagara Falls local lines.

The International has made some concessions in the rates to be charged for interurban commuters' tickets on the Buffalo-Niagara Falls, Buffalo-Lockport and Lockport-Niagara Falls divisions as a result of complaints filed with the commission by the municipal authorities of Niagara Falls and Lockport. Commuters' books of fifty single-trip tickets formerly sold for $8. The company proposed a rate of one-half the cash fare rate, but has now offered a slight reduction which would make the Niagara Falls-Buffalo rate $12 instead of $15; Niagara Falls-Lockport, $15 instead of $16.25. Further rate concessions are sought by the municipalities and additional hearings will be held by Commissioner W. R. Pooley.

Railway Wins Point in Fare Fight

The Birmingham Railway, Light & Power Company, Birmingham, Ala., recently won a point in its fight with the city over the 8-cent fare now being charged, when Judge Locke upheld a plea of the railway that the chancery court had no jurisdiction in the case. He contended that the company since it was in receiver's hands came under federal jurisdiction.

In bringing the suit attorneys for the city contended that the traction company was charging an 8-cent fare in conflict with the franchise agreement with the city. The court was petitioned to enjoin the company from collecting more than a 5-cent fare or else forfeit the franchise right to operate on the streets of the city. The court ruled that it could not condemn property already taken into possession legally by another court with competent jurisdiction.

L. C. Bradley, receiver of the property, and Francis Brown argued the case for the railway. It was their contention that the 8-cent fare was granted by the commission and ordered effective by a federal court judge. It is probable that the city will appeal the case to a higher court in an effort to secure the 5-cent fare.

Plan of City Commission Will Affect Atlanta Railway

The city planning commission of Atlanta expects shortly to announce the results of a city-wide traffic survey that has been in progress for some time. It is apparent that the recommendations of the commission if adopted by the city government are likely to cost the Georgia Railway & Power Company several hundred thousand dollars in making changes in its downtown railway lines.

At least twelve streets close to the business district will be recommended for widening, extending, regrading and repaving, and for revising the transit lines. In fact, the commission reports that every street in Atlanta with railway tracks on it is too narrow. Four through routes are to be recommended for automobile traffic only, in which event railway lines on any of these streets would have to be removed. Furthermore, tracks on a number of other streets will have to be removed if the recommendations of the planning commission are carried out.

Officials of the Georgia Railway & Power Company have advised the commission that the company is favorable to any reasonable changes that would improve traffic conditions in Atlanta. Engineers of the power company are working with the planning commission in making the city-wide survey.

City Commissioners Stand Firm for Five-Cent Fare

Final rejection of the petition of the Galveston (Tex.) Electric Company for an increase in fares was voted by the City Commission in a recent session. The refusal to grant the petition was based on the report of the city attorney that the traction company is earning a fair return on invested capital at the present fare. No amount was stipulated by the company in its petition for authority to raise fares. The company is now charging a fare of 5 cents, the company having lost its fight in Federal court for a 6-cent fare. However, the refusal of the City Commissioners to grant authority for a fare increase is believed to presage another legal fight.

The report of the city attorney declaring that the company is now earning a fair return on invested capital was based on an audit of the company's books made by Ernst & Ernst, accountants.

The electric company had submitted with its petition a report showing earnings, operating costs and other items on which its petition for an increased fare was based. The city attorney disallowed a number of these, greatly reducing the operating costs and increasing the operating revenue of the company. Following the submission of the report of the city attorney on the audit of the company's books a public hearing was held by the city commission, and representatives of the company were allowed to present evidence before the commission showing the need of increased fares.

Transportation News Notes

Through Freight Service Established.—The Ohio Electric Railway, Springfield, Ohio, has added a through freight service from Toledo to Cincinnati, intermediate and connecting line points providing next day delivery.

Freight Rates Cut.—The Rochester & Syracuse Railroad, Syracuse, N. Y., has announced an approximate 10 per cent reduction in freight rates of all classes, effective July 2, between Rochester and Syracuse. This reduction is made so that electric shippers may enjoy the same privilege as the steam lines enjoy by the recent reduction of the Interstate Commerce Commission. The company plans similar reductions on inter-line rates within a short time.

Grants Fare Petition.—Allowing the application of the Boise Valley Traction Company, Boise, Idaho, to make reductions on all round-trip rates where the fare is greater than 36 cents, the Public Utilities Commission has granted the company's petition to lower the loop rates and make important changes in time tables. The reduction will be about 20 per cent of the present round-trip rate and be effective from June 16 for ninety days. The new rate will be 180 per cent of the present single-trip fare. Competition with the Oregon Short Line is given as the reason for the company's asking a reduction in fares.

Higher Rates in Effect.—The 6-cent fare on the railway in Eugene and Salem, Me., operated by the Southern Pacific Railway, recently went into effect. At the same time, the fare between Eugene and Springfield was advanced from 10 cents to 12 cents. The 6-cent fare replaced the former 5-cent charge. The company several weeks ago gave notice of its contemplated advance, and as there were no protests on the part of the City Council or individuals, the Public Service Commission allowed the company to carry out its plans. The company made an effort, some time ago, to advance its fares to 8 cents in Eugene and to 16 cents for the Eugene-Springfield fare. Protests from both cities caused the commission to refuse the increase.

Personal Mention

Young Leader in St. John

M. A. Pooler Takes Up Work as General Manager of New Brunswick Power Company

M. A. Pooler, for the past seven years general manager of the Potomac Public Service Company, is now general manager of the New Brunswick Power Company, St. John, N. B. From his reticence in giving out information concerning himself, it might be deduced that Mr. Pooler has something to conceal. And he really has—a career of remarkably successful service with the Potomac Public Service Company, formerly the Hagerstown & Frederick Railway, and the Pennsylvania-Ohio Power Company of Youngstown, Ohio, which furnishes electric railway, electric light and power service.

M. A. Pooler

Mr. Pooler admits that he was graduated from Purdue University, Ind., and from the Case School of Applied Science, Cleveland. Even without the enthusiastic embellishments of these plain facts which come from Mr. Pooler's associates, any railway Sherlock Holmes could deduce what sort of man this must be.

Many Improvements Under Mr. Pooler

For he has been with the Potomac Public Service Company for seven years, and in addition he is the youngest general manager the New Brunswick company has ever had. This company operates traction lines in St. John and the suburbs of Fairville, Coldbrook, East St. John, West St. John and Lancaster, a total of more than 25 miles. The company also operates the electric light, power and gas plant in St. John.

Under his management the southern company extended its field of service, and now operates in Maryland, Virginia, West Virginia and Pennsylvania. Four hundred miles of high tension transmission lines are operated by the company.

Paul R. Smith succeeds Mr. Pooler as general manager of the Potomac Public Service Company.

Mr. Hemming Resigns

R. N. Hemming has resigned as superintendent of transportation of the Indiana Service Corporation, Fort Wayne, Ind., to accept the appointment as supervisor of the western division of the Railway Audit & Inspection Company. Mr. Hemming will be in charge of the Detroit office.

For six and a half years Mr. Hemming was superintendent of motive power for the Union Traction Company of Indiana, Anderson, Ind. Previous to that he was electrical engineer for the Buckeye Steel Casting Company. His former connections also include positions with the Ohio & Southern Traction Company, Columbus, Ohio, where he was general manager, and Municipal Light Plant of Columbus, where he was chief electrician.

Mr. Hemming was for three years chairman of the standardization committee of the Central Electric Railway Association and he has served on several committees of the American Electric Railway Association. He has also been very active in safety first movements, having been chairman of the electric railway section of the National Safety Council. While in Fort Wayne he organized and was elected president of the Fort Wayne Safety Council.

Mr. Jewell Is Counsel

Ralph H. Jewell has been appointed general counsel and assistant to the president of the Salt Lake & Utah Railroad. Mr. Jewell came to Salt Lake City from Washington, D. C., where he has been attorney-examiner for the Interstate Commerce Commission for the past year. Previous to that he was a practicing attorney in Minneapolis for four years, and for two years was assistant trust officer for the Wells-Dickey Trust Company of Minneapolis, in charge of the corporation bond department.

L. C. Ream Made Auditor

L. C. Ream has been appointed auditor of the Spokane & Eastern Railway & Power Company and the Inland Empire Railroad, with office at Spokane, Wash. Elmo Edwards, formerly auditor of the companies, has resigned. Mr. Ream's jurisdiction will extend over accounting, freight claims, car service, taxes, and right-of-way matters. F. Weidmer has been appointed claim agent, with office at Spokane, to fill the position left vacant by the resignation of J. M. Hone. Mr. Weidmer's jurisdiction will extend over all claims other than freight claims.

R. Paul Smith, General Manager

Succeeds M. A. Pooler in Charge of the Potomac Public Service Company in Maryland

It has taken R. Paul Smith just thirty-three years to learn to walk and talk, to master a variety of engineering matters, and to become general manager of the Potomac Public Service Company. As a matter of fact, only since 1909 has he been connected with railways at all. It was then that he walked out of the Blue Ridge College with his diploma to join the Washington, Frederick & Gettysburg Railway, which is a part of the present company, as clerk and assistant to the general manager.

General Superintendent at Twenty-eight

By 1912 Mr. Smith was division superintendent of the company with offices at Frederick, Md., in the intervening three years having served as agent, general agent and general freight and passenger agent. In 1917, and it must not be forgotten that Mr. Smith was then—figure it for yourself—only twenty-eight, he was made general superintendent. This means that his work was all over the place, for he had supervision of the railway, gas and electric departments of the company. His was real supervision and his the real supervisor's mind, for he let each individual in the company develop his ability to the utmost. Because he can successfully develop the power which lies latent in others and thus increase the efficiency of the organization as a whole, Mr. Smith was unanimously appointed general manager of the Potomac Public Service Company. His headquarters will be at Frederick.

R. P. Smith

Assisting Mr. Smith will be Charles H. Leatham, who has been commercial engineer of the company. Mr. Leatham also served as clerk and division superintendent of the company. Previously he had been associated with the Westinghouse Company and with the West Penn Traction Company at Pittsburgh, Pa.

Mr. Conway Made President

Noted Consultant Heads Reorganized Aurora-Elgin Third-Rail Line—Other Officers Named

Thomas Conway, Jr., has been elected president and chairman of the board of the Chicago, Aurora & Elgin Railroad, the successor company under reorganization to the third-rail division of the Aurora, Elgin & Chicago Railroad.

Mr. Conway is generally recognized as one of the leading public utility consultants of the country. He has served the Aurora, Elgin & Chicago Railroad first and refunding mortgage bondholders' protective committee as technical adviser since the formation of the committee, and upon the death of R. M. Stinson succeeded to the chairmanship of the committee.

MR. CONWAY FAMILIAR WITH PROPERTY

Mr. Conway is largely responsible for the policies which resulted in an increase of almost 50 per cent in the traffic of the third-rail system in the last three years. He has served as a member of various committees of the American Electric Railway Association; was retained as expert adviser to the New York State Electric Railway Association in a consulting capacity, also many other of the largest electric railway properties of the country in similar capacity, including the Public Service Railway, the Connecticut Company, the Pittsburgh Railways, the Wilkes-Barre Railways, the Lehigh Valley Transit Company, the Eastern Pennsylvania Railways and the Utah Light & Traction Company.

E. C. Faber, who some months ago accepted a position as vice-president of Barron G. Collier, Inc., will continue with the property as senior vice-president, devoting part of his time to the interests of railroad. Mr. Faber is well known to the people of the Fox River Valley as the result of twenty years of active work in that vicinity. He is known nationally among electric railway men both as an operator and because of his activities in connection with the work of the American Electric Railway Association.

MR. MCCLURE GENERAL MANAGER

J. H. McClure will have direct charge of operation as vice-president and general manager. He has been connected with Day & Zimmermann, Inc., Philadelphia, since 1910, in charge of various public utility properties controlled by that organization located in Pennsylvania and Ohio. Mr. McClure was general manager of the Citizens Traction Company and the Citizens Light & Power Company of Oil City and Franklin. Pa.. during the years 1912 to 1920. During the latter part of this period he filled the position of vice-president in charge of operation of the Youngstown Suburban Railway, Youngstown, Ohio, and Salem Light Company, Salem, Ohio. In April, 1920, Mr. McClure went to Lima, Ohio, as vice-president in charge of operation of the Ohio Electric Railway, and, in connection with the financial readjustment of the affairs of that company, has served as receiver of the Indiana, Columbus & Eastern Traction Company and as general manager for the receiver of the Columbus, Newark & Zanesville Electric Railway with headquarters at Springfield, Ohio. His headquarters now will be in Aurora, but he will devote part of his time to directing affairs in Springfield.

Publicity Man for Texas

Utilities There Place George McQuaid in Charge of Information Bureau at Dallas

George McQuaid, well-known Texas newspaper man, has been employed by the public utility organizations of Texas, and is in charge of the Texas Public Service Information Bureau recently established in Dallas, Texas, with offices at 1004 Magnolia Building. The bureau is issuing a weekly news bulletin giving current news and interesting information regarding the public utilities operating in Texas, and about public utilities in general. This bulletin is supplied to the weekly and daily newspapers of Texas and to others interested in utilities.

GEORGE MCQUAID

Mr. McQuaid has been connected with various newspapers in Texas for the last thirty years, serving in different capacities from reporter to managing editor and editor. He was born in Virginia in 1875 and was reared in Kansas. He was educated at Georgetown University, Washington, D. C., receiving both the A.B. and B.L. degrees. Soon after graduation from college, he entered newspaper work in Oklahoma, and shortly thereafter became managing editor of the Guthrie (Okla.) *State Capital.* This was before Oklahoma was admitted as a State. Later he joined the staff of the San Antonio (Tex.) *Express,* and was managing editor of this paper from 1905 to 1910. He then went to Galveston as editor of the Galveston (Tex.) *Daily News,* where he remained for three years, being forced to give up this position on account of failing health.

After recuperating in El Paso for more than a year, Mr. McQuaid went to Oklahoma City as staff correspondent for the Dallas (Tex.) *Morning News,* in charge of the news service in Oklahoma. While in Oklahoma, he made an enviable record by building up a news-gathering organization second to none in that State. After about two years, he returned to Dallas and assumed charge of the oil development news of the Dallas *Morning News,* serving in the field as oil editor and staff correspondent.

Mr. McQuaid left the Dallas *Morning News* for about a year to serve as townsite manager for Hamon & Kell, builders of a railroad in the West Texas oil fields. He returned to newspaper work as managing editor of the Dallas *Morning News,* a position he held until December, 1921. He then purchased the Mexia (Tex.) *Evening News* and was editor and publisher of this paper until he sold his interests and accepted the position with the Texas utility organizations.

B. J. Yungbluth has been apointed supervisor of purchases and supplies of the Philadelphia, Pa., Rapid Transit Company. He succeeds G. A. DuCasse, who has resigned.

S. F. Hunter, who has been local agent at Toledo, Ohio, for the Ohio Electric Railway, Springfield, for several years, has been named district passenger and freight agent. R. M. Fisher becomes local freight agent for the railway.

J. H. Pardee, president of the J. G. White Management Corporation, New York, N. Y., has just returned from a trip to the Philippines, where he has been for the past six months, looking after the affairs of the Manila Electric Company and the Philippine Railway.

C. G. Adsit, formerly chief engineer of the development department of Georgia Railway & Power Company, Atlanta, and consulting engineer of the executive department, is now executive engineer of the company, with authority over the engineering work of all departments of the company.

Polk Laffoon, secretary and treasurer of the South Covington & Cincinnati Street Railway, Covington, Ky., has been named a member of the Kentucky Racing Commission by Governor Edwin P. Morrow. Mr. Laffoon succeeds J. O. Keene. He is the only northern Kentuckian on the commission. Mr. Laffoon is a resident of Erlanger, Ky., south of Covington.

W. R. Dunham, Jr., formerly engineer of maintenance-of-way of the Connecticut Company, New Haven, Conn., is now engaged in special work for the International Steel Tie Company, Cleveland, Ohio. He is acting also as Eastern agent of the company with headquarters at 69 Stanley Street, New Haven, Conn. Since leaving the Connecticut Company in 1921, Mr. Dunham has also done some consulting work in the track field.

DISCUSSIONS OF MARKET AND TRADE CONDITIONS FOR THE MANUFACTURER, SALESMAN AND PURCHASING AGENT

ROLLING STOCK PURCHASES BUSINESS ANNOUNCEMENTS

Traffic Congestion Retards Coal Delivery

The thirteenth week of the coal strike has been marked by recurrence of traffic congestion in certain of the non-union fields, and as there has been no compensating increase in the fields affected by the strike the production of bituminous coal will be slightly less than in the week preceding. Production of anthracite is still practically zero.

Complete returns for the twelfth week, June 19-24, show a production of 5,337,000 net tons of bituminous coal and 24,000 net tons of anthracite, a total of all coal of 5,361,000 tons. In the corresponding week a year ago the total raised, including anthracite, was 9,550,000 tons. In 1920, when business was active, it was 11,960,000 tons. In terms of all coal, therefore, the quantity now being mined weekly is five to six million tons below normal.

Philip L. Maury Goes to Detroit Graphite Company

Philip L. Maury has become associated with the Detroit Graphite Company as a vice-president, with headquarters at Detroit. He will have direct charge of all the activities of the company pertaining to its paint and varnish business with railroads, street railways and allied interests. He is well known to the railway and supply world throughout his many years' connection with the Sherwin-Williams Company as manager of railway and industrial sales, which position he leaves to take up his new duties with the Detroit Graphite Company.

During the war he was in charge of the government activities of the Sherwin-Williams Company and was closely identified with the work of the war service committee of the Paint Manufacturers' Association and was active in the preparation of government specifications and development of special coatings for many uses brought about by war conditions.

Dissolution Distribution Held Up

The protective committee of the bondholders of the Barney & Smith Car Company, Dayton, Ohio, in letters sent out recently announced that the committee will hold in its possession the distribution recently ordered on the bonds. Each bond received $162.18 from a fund in the hands of the Guaranty Trust Company, which had been accumulated from the sale of parts of the plant at Dayton.

The committee announces that it has invested $206,098.76 in United States Treasury certificates of indebtedness which have been placed in the Citizens National Bank & Trust Company, Cincinnati. The letter says:

> The committee deems it in the interest of the depositing bondholders not to make distribution of this fund at present, because it hopes that the retention of the fund will place the committee in a position to gain advantage for the depositing bondholders when the property is sold or when reorganization is effected.
>
> Depositors may feel assured that the committee will not retain the fund any longer time than shall appear to be essential in the interest of the depositor.

The communication is signed by the committee, of which Leo J. Van Lahr is chairman and Hugh P. Colville is secretary.

$100,000 to Be Spent on Track in Memphis

Memphis (Tenn.) Street Railway has been authorized to construct additional tracks on McLemore Avenue in accordance with an amendment to the charter filed with the county register in pursuance of its plan to establish a continuous car line from Overton Park to Riverside Park. The proposed improvement will cost more than $100,000, according to T. H. Tutwiller, one of the receivers, and it is probable it will be completed within two years. The plan includes the construction of three stretches of tracks necessary to complete the cross town line through the center of the city from the northeast to the southwest, including the work that is now being done at the McLemore Avenue viaduct. The proposed cross-town line, when completed, will establish a one transfer system between Riverside Park and Raleigh Springs and Binghamton, the transfer point being Poplar Avenue and North Cleveland Street. Construction of the three links that will complete the proposed cross-town line is largely dependent upon the city's construction of the subway on South Bellevue boulevard since the street railway must pass under the railroad at this point. There will be constructed a short stretch of new track on Beale Avenue between South Orleans Street and Myrtle Street. This line will connect the present Beale car line with the Peabody line and the result will be the rerouting of the Peabody cars.

Large Expenditure Involved in Improvements

According to a recent statement of A. E. Potter, president of the United Electric Railways, Providence, R. I., about $300,000 would be spent out of earnings this summer to co-operate with the city on paving work. In addition, there will be spent, out of the $1,000,000 bond issue contemplated by the plan of reorganization and current earnings, more than $500,000 for fifty new forty-passenger cars already ordered, and about $1,300,000 for improvements to the power house, new high-tension wires and laying of wires underground. The fifty cars now on order are in addition to the twenty-five one-man cars already received.

Frankford Elevated Signal Contract Awarded

The Department of City Transit of Philadelphia has awarded a contract to the Union Switch & Signal Company for the complete installation of an automatic block signaling and interlocking system on the Frankford Elevated Railway. The installation comprises, essentially, double track signaling extending from Arch Street, where the new elevated joins with the Philadelphia Rapid Transit existing elevated lines, north to Bridge Street, a distance of approximately 6 miles. Within this territory electro-pneumatic interlockings, utilizing alternating current throughout, will be installed at Arch Street, Girard Avenue, Dauphin Street, Torresdale Avenue and Bridge Street.

At Arch Street a nineteen-lever-frame electro-pneumatic machine comprising nine working levers for the control of twenty-seven signals, three levers for control of four switches and four levers for traffic control, and three spare spaces, will be required. At Girard Avenue, Dauphin Street and Torresdale Avenue three eleven-lever electro-pneumatic machines will be installed, each involving three working levers for the control of eight signals, one lever for two switches and four levers for traffic. Three spare spaces will be provided in each of these machines. At Bridge Street an electro-pneumatic machine, involving seven working levers for the control of twenty-two signals, three levers for the control of six switches, two levers for traffic and ninteen spare spaces will make up the thirty-one lever-frame machine.

Fifty automatic block sections with electro-pneumatic automatic train stops and three indication color light signals will be involved. Alternating current will be used exclusively for the control and operation of all the signal and interlocking in this contract.

Metal, Coal and Material Prices

Metals—New York	July 4, 1922
Copper, electrolytic, cents per lb.	13.875
Copper wire base, cents per lb.	15.50
Lead, cents per lb.	5.75
Zinc, cents per lb.	5.72
Tin, Straits, cents per lb.	31.50
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$6.17
Somerset mine run, Boston, net tons	$3.47
Pittsburgh, mine run, Pittsburgh, net tons	....
Franklin, Ill., screenings, Chicago, net tons	...
Central, Ill., screenings, Chicago, net tons	...
Kansas screenings, Kansas City, net tons	3.05
Materials	
Rubber-covered wire, N. Y., cents per lb.	6.25
Weatherproof wire base, N. Y., cents per lb.	15.50
Cement, Chicago net prices, without bags	$2.07
Linseed oil, (5-bbl. lots), N. Y., cents per gal.	92.50
White lead, (100-lb. keg), N. Y., cents per lb.	12.50
Turpentine (bbl. lots), N.Y., per gal.	$1 25

Rolling Stock

Wellsburg, Bethany & Washington Railway, Wellsburg, W. Va., has just placed a new passenger car in service.

Olean, Bradford & Salamanca Railway, Olean, N. Y., is equipping single and double-truck cars for one-man operation.

Chicago Surface Lines is about ready to place orders for fifty or more new trailers and about twenty-five double truck one-man safety cars.

Trenton & Mercer County Traction Company, Trenton, N. J., expects to purchase two double-truck snow sweepers, two single-truck snow sweepers, one snow plow and one nose plow.

Indiana Service Corporation, Fort Wayne, Ind., will shortly place an order for about fifteen one-man safety cars of the type now in use in Fort Wayne, Ind.

Chicago, Aurora & Elgin Railroad, Aurora, Ill., the successor to the third-rail division of the Aurora, Elgin & Chicago Railroad will purchase twenty new all-steel cars under authorization of the board of directors.

Kentucky Traction & Terminal Company, Lexington, Ky., is reported to be considering the purchase of several more one-man light-weight interurban cars of the type described in the *Electric Railway Journal*, issue of June 3, 1922.

Kansas City (Mo.) Railways has placed an order with the J. G. Brill Company, subject to approval of the court, for twenty double-truck motor cars arranged for train operation and for one or two men when operating as single units. They are equipped with the HL control, safety devices and G.E. 247 motors.

The Chicago North Shore & Milwaukee Railroad, Highwood, Ill., has placed an order with the Cincinnati Car Company for forty new cars. These include fifteen motor merchandise cars, seven motor limited coaches, one motor dining car, two parlor observation trailers, one utility line car, twelve safety cars for the Milwaukee city lines operated by the North Shore Railroad and two lightweight interurbans for the Libertyville branch.

Community Traction Company, Toledo, Ohio, has converted six double-truck city cars for one-man operation by installing turnstiles on the rear platforms. By placing seats in the extra space made available the capacity of each car has been increased from forty-eight to fifty-three passengers. In connection with this change the usual safety devices have been added. The company expects to convert a total of sixty cars to the one-man turnstile variety.

Cincinnati (Ohio) Traction Company will procure approximately seventy-five new double-truck cars of the lighter type, to replace the small cars on lines on which the larger cars now can be operated. Arrangements for securing the money to buy the cars were started July 1, when authority was requested from the directors of the Cincinnati Street Railway and from the Ohio State Public Utilities Commission to issue $725,000 first lien equipment trust certificates. This is in accordance with the car trust certificate plan for buying cars. The last cars purchased by the traction company two years ago were procured under that plan. The new cars will be approximately the same capacity as the large double-truck cars now in use, but will be much lighter in construction. Walter Draper, vice-president of the traction company, announced that the cars would be of a type that can be operated by either one or two men as may be desired.

Track and Roadway

Guelph, Ont.—The City Council has authorized an expenditure of $150,000 on the Guelph Radial Railway.

Trenton & Mercer County Traction Company, Trenton, N. J., expects to rebuild 35,000 lineal ft. of city track under pavement.

Shreveport (La.) Railways expects within a few weeks to build a loop at the end of the Cedar Grove line for turning the cars. Only a diamond switch and frog are needed.

Chicago, Aurora & Elgin Railroad, Aurora, Ill., has already started on the stone ballasting of the main line from Chicago to Wheaton. Several miles of line have been put in first class shape in and near Maywood.

Philadelphia, Pa.—The contract for completing the work on the Frankford "L" has been awarded to F. J. Boas. The Boas' bid of $534,180 was $32,000 lower than that of the Philadelphia Rapid Transit Construction Company.

Northern Ohio Traction & Light Company, Akron, Ohio, has recently been making extensive repairs to the Cleveland Alliance & Mahoning Valley Railroad property between Ravenna and Warren in order to accommodate the limited service which has recently been inaugurated over this line. The overhead construction is also being rehabilitated on the Myers Lake line, with extensive changes in Myers Lake Park, which will add greatly to the reliability of service this summer.

Power Houses Shops and Buildings

Wichita Falls (Tex.) Traction Company is drawing up plans for a new carhouse which will be of steel and concrete fireproof construction.

Tarentum, Brackenridge & Butler Street Railway, Tarentum, Pa., expects to build a small machine shop and to include a 24 in. x 12 ft. lathe, a 20 in. drill press and grinder in this shop, all equipment to be motor driven.

New York, N. Y.—The Transit Commission has approved the plan for the reconstruction of the Queens Plaza station to enable the Brooklyn Rapid Transit Company to participate in the operation of the Astoria and Corona branches. Because of the difference in the width of the Brooklyn Rapid Transit and Interborough Rapid Transit Company's cars the Interborough alone has been operating these branches. This improvement will cost $100,000 for structural changes to the stations and $60,000 for track work.

Trade Notes

American Bridge Company, New York, N. Y., announces the removal of its vice-president's department, chief engineer's department, eastern division contracting department and treasury department on and after June 24 to the Empire Building, New York.

Wilson Welder & Metals Company, Inc., New York, N. Y., recently appointed King-Knight Company, Underwood Building, San Francisco, Cal., exclusive representatives in central and northern California for Wilson plastic-arc welding machines and Wilson "Color-Tipt" metals.

Pittsburgh High Voltage Insulator Company will carry on its business in the future under the name of the Westinghouse High Voltage Insulator Company, according to an announcement made by C. M. Semler, general manager. The change in name, which was made by vote of the company's stockholders does not affect the management or method of conducting the business of the company which will be carried on as it has been in the past.

The National Railway Appliance Company, New York, N. Y., is selling a new product known as "Themec" paint. The principal use of this material is the protection and rustproofing of metals and other materials. The pigment of Themec paint is portland cement. Exposure to the elements gradually turns this cement content into a thin veneer of stone. Tests indicate that this material provides an increased protection coating. It is being used by several roads for general and miscellaneous work.

New Advertising Literature

John A. Roebling's Sons Company, Trenton, N. J., has issued a small booklet on electric welding wire and also wire for gas welding.

Truscon Laboratories, Detroit, Mich., has issued a specification handbook of 108 pages. This contains specifications on steel coatings, floor hardeners and damp and waterproofing products.

Terry Steam Turbine Company, Hartford, Conn., has issued an attractive booklet describing its turbine units and blowers. Information is also furnished regarding improvements in design.

Dallas and Its Railway Reach a Settlement

DALLAS has done the sensible thing. The city and the local railway have settled in conference a controversy that at one time threatened to reach the courts. As a result of this amicable adjustment the Dallas Railway is to be permitted to continue to charge a 6-cent fare for another year and in return agrees to spend approximately $500,000 on a program of improvements. Both sides to the controversy gave ground. Each expressed confidence in the other. Each had respect for the motives that prompted the other in the stand which it took. Honest differences of opinion have arisen before in Dallas between the railway and the city, but in every case a way out has been found that has left no feeling of remorse on either side. That there is an unusual degree of respect for each other between the parties at Dallas is reflected in the statement of the local company that "we rely upon the sense of fairness and justice of the Board of Commissioners again to extend the said 6-cent fare if conditions twelve months from now warrant such extension."

It is generally agreed that credit for hitting upon the terms of the present settlement basis is due to Supervisor of Public Utilities J. W. Everman. His part in the negotiations certainly was a large one and his efforts bespeak for him a real understanding of the functions of the post which he so creditably fills. All in all, the settlement there is certainly a most propitious arrangement for all concerned.

Accident Reduction Should Appeal to the Men Higher Up

THE safety movement is one worthy of the most enlightened interest of electric railway managers. They have in the past, however, left the matter largely to their claims departments, accepting the conclusion that some loss of life and a greater maiming of employees and the general public form a necessary accompaniment of the transportation business. Their attitude was in part justified by the willful risks taken by Mr. Average Citizen, who nullifies many of the best-intentioned efforts to safeguard him from injury. However, the managerial attitude is changing rapidly now.

Probably the most cogent reason for the improved status of the safety movement in the electric railway field is the demonstration that accidents can be prevented. "No-accident weeks" tell their own story. Another powerful stimulus to interest is furnished by the tremendous cost of accidents in many localities. Increasing vehicular and pedestrian congestion, combined with recklessness, cut into the net income seriously. So with the growing conviction that accidents can be prevented comes the growing necessity for preventing them. This situation will be clearly portrayed in a group of articles in next week's issue of this paper.

One thing that, more than anything else, will help the safety movement in the electric railway field is that it be taken seriously. Too often it is looked upon as a "hot air proposition" and given only scant encouragement. The manufacturing industries are in the lead here, due in part to the fact that they deal almost altogether with employees, while in the case of the electric railway public accident hazards prevail. At the same time the electric railway has more to gain from effective safety work because the risk is greater. Money saving, improvement in public good will and reduced interference with operation are only three of many desirable results in this field.

What Is the Present Status of Rail Standardization?

THE Cleveland Railway has a new T-rail section of its own and the Market Street Railway (San Francisco) is branching out with a new girder grooved rail. What, if anything, is the matter with the association standard sections, that these important properties have to go outside the list for their recent construction? This is a question which will arise spontaneously in the mind of every engineer who is desirous of securing the savings that standardization will ultimately bring.

It is obvious that the engineers of the two properties mentioned did not decide to incur the extra expense of having special sections rolled without carefully weighing the merits of existing standards. They decided that the special sections were worth the extra money. They wanted to be able to express their engineering convictions in cold steel and were willing to pay the price. No one can blame them, and at the same time there is no reflection on the standards. Why? Because on the one hand if an engineer has a good idea he ought to be allowed to try it out if he can get the money. On the other hand, the standards represent the best average practice and tendencies and are offered to the industry for what they are worth. Most railways can save money and trouble by using them. They cannot cover all conditions and merit the approval of all individuals. Their use cannot be enforced by law, nor will loyalty to an association outweigh engineering considerations. Hence failure to use them in particular cases simply means that the appeal of the local problem prevailed.

These generalizations suggest a little specific calculation. How much extra does a special rail section cost? Of course this depends on the quantity rolled and the terms of purchase agreed upon. The most satisfactory plan to follow, when a railway wants a new section rolled, is for the railway to put up the money for the rolls, the amount to be rebated eventually if the section proves popular. Thus, assume for purpose of calculation that a set of rolls for a T-rail section costs $6,000. If other railways desiring to use these rolls will pay a premium of a dollar a ton for their rails the cost would be recouped in a short time if the section made a hit.

This would involve the rails for less than thirty-five miles of single track, assuming a 100-lb. rail. Thus, the industry would pay 2.5 per cent extra for this rail for a limited time, after which the price would fall to the market value. A dollar a ton appears to be a reasonable premium. Obviously it would not pay to design a special section for a few hundred tons of rail, but if the immediate and prospective demand is such as to amortize the extra cost without excessive premium one can understand the occasional ordering of new designs by large companies.

At the same time standardization should be fostered by the industry to a much greater extent than it is. All companies, and particularly the smaller ones, will profit by it. This paper has been a consistent advocate of the movement for many years. It takes a skeptical attitude toward an apparent need for new designs when there are old and tried ones in the field. But standards, like everything else, are subject to improvement. So along with standardization must go experimentation. The engineering and economic problem is to strike a proper balance between the two. But it should be clear that there is a real need for any new rails, or other non-standard products, before new ones are adopted. If possible any proposals for new designs should first be discussed with organizations responsible for the strong efforts at standardization which are now being made. The present tendency is toward lessening varieties of manufactured products as much as possible.

Reserve Bank Shows Stability of Electric Railway Business

VARIOUS measures for determining the trend of business activity in a community have been suggested. They include activity in the building industry, extent of bank loans, bank clearances and real estate sales, number of telephone calls, amount of post office receipts, the trend of raw material prices, and street railway traffic. In the monthly review for June of the Federal Reserve Bank of Boston considerable space is given to the discussion of the use of street railway traffic statistics for such a purpose, and while it is admitted that there is no exact measure for business activity, the opinion is expressed that street railway figures afford a good guide. For this purpose a composite chart of nine Massachusetts companies has been prepared and adjusted for seasonal variations, because of the larger business always done by these companies in summer over that in winter. According to the Reserve Bank the fluctuations as shown in this chart correspond closely to the general trend in business as shown by other indices for the years under consideration.

The chart also proves an interesting point not mentioned in the bank comment. This is that while the line of street railway traffic may follow the general trend of other business conditions, it does not swing so far in each direction, and consequently as an investment it is much more to be desired by those who want steady, continuous performance rather than wide fluctuations.

For example, in the chart, after being adjusted for seasonal changes, the greatest rise between January, 1919, and May, 1922, over the 1921 average seems to be in about September, 1920, when the increase was about 14 per cent, and the depth was reached at about 85 per cent in August, 1921. This is a maximum swing of about 34 per cent based on the lower number.

Here are the figures of all of the other manufacturing and financial charts, on the same basis and for the same years, as checked roughly from the diagrams given in the same report:

Manufacturing activity in New England[a]	67% to 105% or 57%
Brokers' commercial paper	3.5% to 7.8% or 123%
Rediscount rate of Federal Reserve Bank of Boston	4% to 7% or 75%
Woolen manufacturing activity in New England[a]	32% to 120% or 275%
Cotton manufacturing activity in New England[a]	44% to 107% or 143%
Shoe manufacturing activity in New England[b]	46% to 140% or 204%
Paper production in United States	380,000 tons to 650,000 tons or 71%
Construction in New England[c]	33% to 118% or 257%
Net sales of eight department stores in Boston[d]	80% to 215% or 169%
Net sales of eighteen department stores in New England outside of Boston[d]	88% to 225% or 156%
Exports of boots and shoes	40,000 pairs to 230,000 pairs or 475%

(a) A basis of average rate, year ended June 30, 1920; (b) on basis of 1920; (c) on basis of 1913; (d) from January, 1921, to May, 1922, basis of first half of 1919.

All of these figures are approximated from the chart and not from tables, but they show that every industry quoted has a much wider swing than the electric railway industry.

As explained, this is an important feature from an investment point of view. It is also desirable from the standpoint of the employee, as he is not so liable to be thrown out of service on account of lack of work as he would be if the swing were wider.

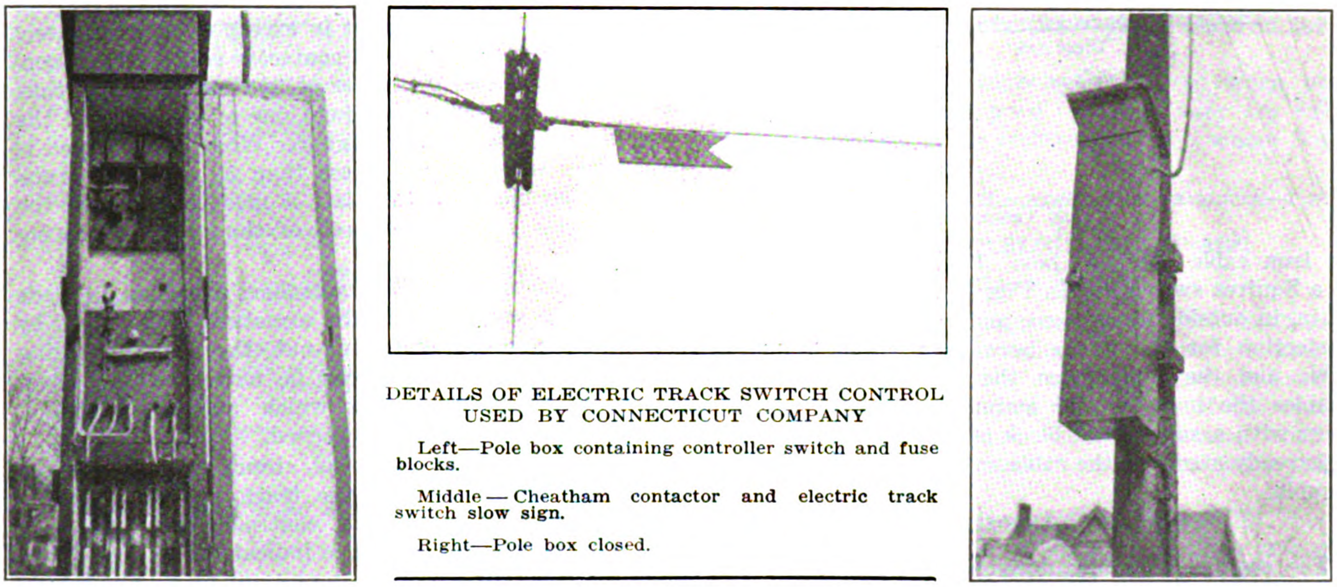
Des Moines Decision Only an Annoyance

OPPONENTS of the settlement franchise in Des Moines are gloating over their victory before Judge Hume in the Polk County District Court. On their face the counts which that court makes against the franchise grant appear formidable, but they are not so bad as would at first appear. Moreover, the higher courts must pass upon them. Even if it is assumed that the decision of the State Supreme Court should uphold all the contentions of the lower court—an assumption which appears to be most unlikely—the fact remains that the people of Des Moines in their vote on the franchise registered overwhelmingly their desire that the railway controversy be removed from politics and that the company be permitted to operate under conditions that would make it possible for the railway adequately to serve the public. Events since the decision of the lower court was handed down confirm the fact that the decision is not popular with the great bulk of the people. Should it finally materialize that the settlement matter must again go before the public, there is little reason to doubt that the grant will be promptly re-enacted.

The Special Safety Issue of This Paper Will Appear Next Week

Increasing Reliability of Track Switch Operation

During the Past Two Years the Connecticut Company Has Reduced Track Switch Interruptions to an Almost Negligible Element in Operation—This Was Accomplished Through Close Attention to Detail in All Parts of the Electromechanical Apparatus



DETAILS OF ELECTRIC TRACK SWITCH CONTROL USED BY CONNECTICUT COMPANY

Left—Pole box containing controller switch and fuse blocks.

Middle — Cheatham contactor and electric track switch slow sign.

Right—Pole box closed.

THE Connecticut Company has in successful operation a large number of track switches on its several divisions, most of these being of Squires' or Cheatham make. During 1921 the average number in operation on the Bridgeport division was twenty, on the Hartford division twenty-four, on the New Haven division thirty-three, on the Waterbury division between five and six and on the New Britain division four. The total of these is so large that it has been practicable to give much expert attention to their installation and maintenance. During the past two years, after careful study of causes of interruptions, improvements have been introduced here and there which have greatly reduced such interruptions.

Typical interruption records are reproduced to show how effective this work has been. The reports show that many individual switches operate for long periods without failure of any kind, and many of the failures reported are due to trifling causes.

Taking the reports for a recent month in the winter, when interruptions are most likely to occur, there are found the following typical descriptions of causes of interruptions together with the action taken by the maintainer:

Not throwing power off. Contact point burned off. Renewed same.

Installed one coil slate controller. (This controller is described later in the present article.)

Wishbone stuck. Adjusted same. Impulse contact loose. Tightened same. Installed one coil slate controller.

Impulse lead burnt off at contactor. Installed one coil slate controller.

Leads to magnets burnt off.

Impulse fuse blown.

Feed and ground fuses blown.

Power off. Lead burnt off in pits.

Found flash "short" in off coil of magnet due to its being water-soaked. Will dry out same. Installed new magnet.

Lead "shorted" in conduit. Will have to dig up conduit. Removed magnet and installed new one.

Open coil in magnet. Replaced it.

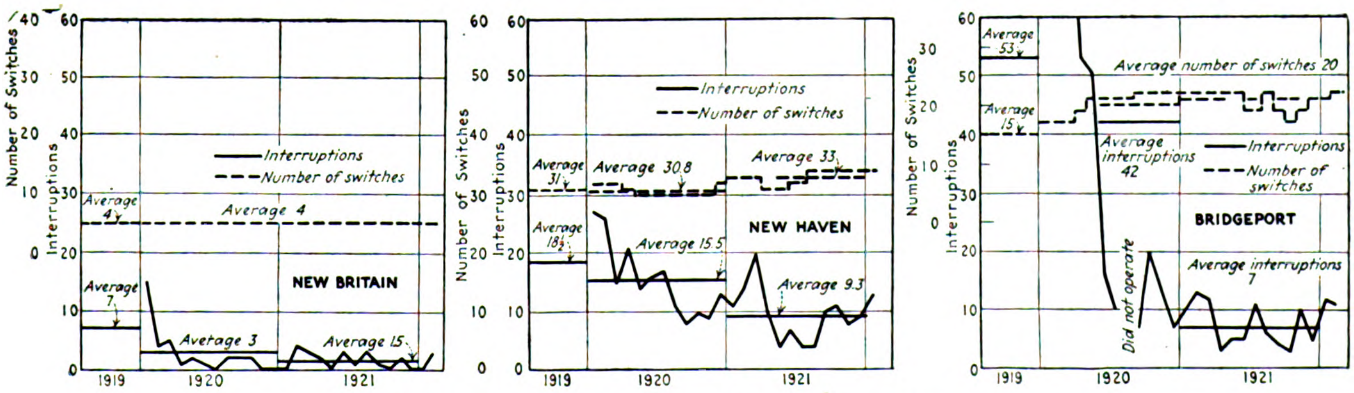
Magnet leads burnt off. Repaired same.

Controller out of adjustment. Adjusted same and switchboard is O. K.

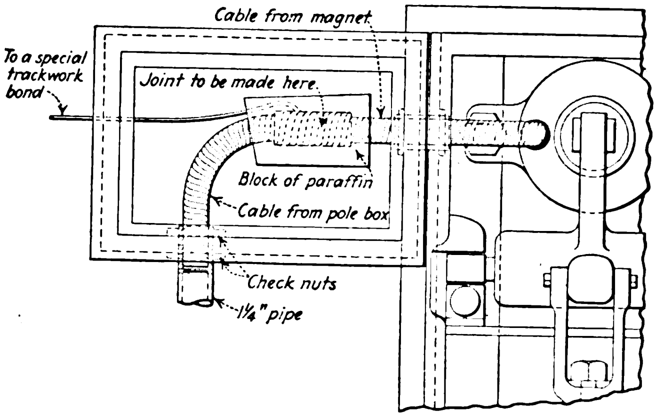
"Magnet" shorted. Installed new magnet and underground cable.

Controller moving element frozen.

One auxiliary to the track switch proper which has been found effective in keeping down cable troubles is



TYPICAL ELECTRIC TRACK SWITCH INTERRUPTION RECORDS



Cable from magnet
To a special trackwork bond
Joint to be made here
Block of paraffin
Cable from pole box
Check nuts
1¼" pipe

FIG. 1—AUXILIARY TRACK SWITCH BOX DESIGNED TO ELIMINATE CABLE TROUBLES

an iron cable entrance box. This is shown attached to a Squires switch box in Fig. 1. This box is 9 in. by 13 in. in outside dimensions, and provides a mechanical protection for the joints between the switch magnet cable and the cable from the overhead contact. It enables the installer and maintainer to surround the joint with a substantial block of paraffin. It also permits ready access to the cable entry in case of electrical trouble.

A SPECIAL CONTROLLER IS USED

The company has also developed a track switch controller, the one referred to in the report quotations herewith. This is mounted with a switch and fuse blocks in a substantial cabinet on a pole adjacent to the switch. The features of this controller are shown in Figs. 2, 3 and 4.

In Fig. 2 the controller is shown mounted in the pole box, with a three-pole, double-throw switch above, and a row of three fuse blocks below.

The controller consists simply of a car circuit magnet coil, which when energized attracts a hinged armature carrying on its end a brass contact. When the magnet is energized with a current in excess of approximately 30 amp. from the overhead contactor rail it causes contact to be made on the upper of two contact studs, thus completing the circuit through one of the coils of the track switch operating magnet. When the magnet is energized with a current less than 30 amp. the armature is not moved and contact is made to complete the circuit through the other coil of the switch operating magnet.

For adjustment of the controller, provision is made for raising and lowering the armature hinge pivot by means of a screw and wing-nut, the armature being hinged on a plate which can be moved by the screw when the machine screws which normally clamp it securely in position are loosened.

Fig. 4 shows the electrical circuits connecting the overhead contactor with the track switch operating magnet through the switch, controller and fuses. In the diagram the car circuit is indicated by a heavy line and the track switch operating circuit by a light line.

The feature of this simple controller is its mechanical reliability. The electrical contact which is made between the brass contact piece on the armature and the brass studs has proved to be reliable without platinum or other facing because the current is not broken at this point during a correct operation.

The mechanical details of the controller are given in Fig. 3.

The maintenance of these electric track switches is

under the supervision of two departments, namely, the line department and the track department. The line department maintains all the electrical parts, such as the contactor, the pole box and its contents, the overhead and underground cables, the track magnet, and the overhead sign. The track department maintains the main track box together with its links, the switch tongue, the auxiliary box, the underground conduit and the drain to the sewer.

The line department effects this work by means of a switch and signal maintainer, who is equipped in most cases with a Ford car and on the larger divisions he also has a helper. The track department likewise has a man who is experienced in the upkeep and adjustment of the links in the track box.

When a switch fails to operate as it should, it is the duty of the crew so finding it to report the trouble to a starter or dispatcher, who in turn reports the matter to the line department. These maintainers, in general, keep in close touch with the dispatchers, who more often report the trouble directly to the maintainer so that it may be repaired speedily.

FIG. 5—REPORT FORM USED FOR RECORDING TRACK SWITCH INTERRUPTION RECORDS

The line department makes it a point to inspect these switches once a week and at that time all the contacts are cleaned and renewals made.

The track department inspects all switches every day, both those which are electrically operated and those which are not. At this time the working parts in the track box are cleaned.

When controllers or magnets become so worn or burned as to be unfit for good operation they are removed and delivered to the reclamation shop, where the necessary repairs are made.

Electrically Operated Marker and Classification Lamps

THE accompanying diagram shows the method adopted by the San Francisco & Sacramento Railroad to provide electrically operated markers and classification lamps which are not a part of the car. Lamps may be used the same as standard lamps, using two classification, or two markers, or all four lamps as desired.

The standard marker lamps were adapted to this purpose by the installation of 4 cp. automobile lamps with bayonet sockets to overcome the possibility of the lamps coming loose in sockets due to constant handling. A 6-volt battery was installed to provide current for the lamps when the trolley was off. This was also extended to provide lights inside of the cars at the same time and to give the train crew a visible warning that marker lamps were operating on the battery side.

Closed when cover is down
Battery
Battery
Battery
Battery

WIRING DIAGRAM OF BATTERY CHARGING CIRCUIT AND BATTERY LIGHTS FOR CARS AND MARKERS

Small coupler sockets were made and installed in the letterboards, and the ventilating top of the markers was removed and tubes were installed to carry a plug on the end of the cable when the lamps are being carried on hooks inside of the car, or being carried from one car to another.

No switches for connection were installed in this circuit, it being only necessary to hang the markers and insert the plugs. When lights are turned on inside of the cars the markers or classification lamps, or both, are also lighted. This is done to overcome the possibility on the part of the trainmen of forgetting to turn the lights on when it grows dark. This lighting circuit requires ½ amp. when operating the lamps, and it also provides ½ amp. trickle charge for the battery.

How to Get the Most Out of Energy-Saving Work

By William Arthur
Electric Railway Engineer, New Haven, Conn.

Employees Can Prevent the Waste of Energy in Many Ways — Saving Begins in the Power Department and Includes the Cars, the Carhouses and Shops, Distribution System and Property Generally

IT IS sometimes lost sight of that on a street railway the coal or power bill, except for wages, is the largest single item in operating expenses. As a general thing it will be found that with, say, a 6-cent fare, 3 cents will go for wages and 1 cent for coal or power, while the remaining 2 cents will be subdivided among all the other departments such as maintenance of tracks, maintenance of cars, interest and other items. To reduce the power bill, therefore, offers a most obvious and easily accomplished means of economy.

Many people, when they think of a power-saving campaign, have in mind only the economies to be made by motormen. While this is important, the writer believes the fact is not sufficiently appreciated that there is hardly any department in a street railway which cannot influence the coal or kilowatt-hour consumption per car-mile. To be really effective, a power-saving campaign should extend its activities until it brings about power economies everywhere, in the power station, in transmission lines, in trackwork, in repair shops and in many other departments.

With the above in mind, it has appeared to the writer worth while to make a list of the chief ways in which coal and power can be saved in the various departments of a street railway, so that men working in these departments might study the specific recommendations and endeavor to carry them out from day to day. Any property on which this is done will find that the cumulative effect of so many departments co-ordinating in the matter of power consumption will have a very gratifying result.

In the Power Station

Men in the Boiler Room Can Save Coal by

(1) Seeing that fires are kept at the proper thickness, neither too thick nor too thin.

(2) Avoiding all holes in the fuel bed.

(3) Avoiding unnecessary leaks of air into the combustion chamber.

(4) Seeing that too many boilers are not in use to take care of the load at each hour of the day.

(5) Reporting leaky flues and pipe connections.

(6) Keeping the brickwork of the boiler settings, also observation, fire and dust doors tight, thus preventing excess air entering the furnace.

(7) Seeing that all dampers are in good operating condition, so that the draft may be ample and under control at all times.

(8) Keeping the interior of all boilers free from scale and keeping the exterior of the heating surface and back connections free from soot. It has been estimated that 100 lb. of scale causes the waste of 400 lb. of coal each twenty-four hours.

(9) Keeping all baffles in good condition, so preventing the gases from being short-circuited to the flue connection.

(10) Not opening the fire or observation doors more than is necessary.

(11) Firing moderate quantities of coal each time.

(12) Exercising care at times of fire cleaning and dumping to prevent coke being thrown out with the ashes.

(13) Exercising care in feeding water to the boilers.

(14) Controlling the drafts so as to prevent safety valves from wasting steam by "blowing off."

(15) Maintaining normal pressure in boilers, as low steam pressure means more steam used by the engines.

(16) Stopping all leaks in blow-off valves, gage cocks, gage glasses, boiler drips, and pipe joints, also by keeping all valve packings tight. Many tons of coal are wasted each day by these items.

(17) Keeping all pipe covering and boiler covering intact. A bare pipe or surface radiates five times as much heat as a well-covered surface.

(18) Keeping the feed water at a maximum temperature; every 10 deg. F. increase saves 1 per cent of coal.

(19) Keeping feed pumps and feedwater heaters in good condition.

Men in the Engine Room Can Save Coal by

(1) Seeing that machinery is not allowed to run idle.

(2) Turning off unnecessary lights.

(3) Avoiding leaks by seeing that all valve mechanisms on engines and turbines are properly adjusted and the valves and seats in good condition.

(4) Seeing that piston packing rings and piston rod stuffing boxes do not leak.

(5) Having all moving parts in proper alignment, thus reducing friction.

(6) Keeping all cylinder drain and relief valves in good condition.

(7) Keeping all receivers well covered.

(8) Seeing that all steam traps are in good condition and are returning all clean condensation to the heaters.

(9) Keeping the condensers in good operating condition in order to maintain the proper exhaust pressures.

(10) Loading all generators to full load and shutting down all idle units, keeping the capacity in service as nearly corresponding to the load as possible.

(11) Avoiding all pipe joint leaks and defective pipe covering.

(12) Keeping accurate records of plant performance and investigating the causes of wide variations in results obtained.

(13) Substation operators can save coal by operating rotary converters at full load.

On the Cars

Motormen Can Save Coal by

(1) Running as little time as is necessary on resistance notches.

(2) Not holding power on too long.

(3) Coasting more.

(4) Not braking car too slowly.

(5) Not spending more time at end of line than schedule calls for.

(6) Not running too close behind another car.

(7) Not applying brakes unnecessarily.

(8) Reporting places where voltage of power seems low. This low voltage may be due to defective bonding or feeders, and so be a cause of wasted power.

(9) Being alert at all times, watching for persons wishing to board car, watch-

ing for vehicles ahead or any other thing in the street which might cause a delay.

(10) Using foot gongs; many slow downs or stops may be avoided by the timely use of gong.

(11) Promptly reporting car trouble in such a way that carhouse men will understand what the trouble is. Nearly every defect increases the amount of power used.

(12) Helping your conductor as much as possible. This means "team work." Don't lose interest if he holds you a few seconds at a stop. Sometimes he can't help it.

(13) Not talking to the motormen of the cars you ride on while they are on duty.

(14) Not trying to coast going up a grade, as this wastes power in resistances by causing too frequent notching up.

(15) Releasing your brakes as much as possible when stopped on level track; this saves time and power too.

(16) Using sand at all places where rail is bad. This enables all the power passing through the motors to be used to speed the car up, not in spinning the wheels.

(17) Stopping your car with the doors as near as possible to where passengers are standing; this saves many seconds at each stop.

(18) Opening all doors at places where a number of persons board car; this is a great time saver and therefore a coal saver.

(19) Passing over and through special work and curves at a safe speed with power off and brakes released. You are then less likely to have to stop due to pole coming off. Thus you save time and power.

(20) Using power for as short a time as possible to throw electric switches. The switch pan is not more than 3 ft. long, yet some motormen have power and brakes on for 100 ft.

(21) Passing under section insulators with power off.

Conductors Can Save Coal by

(1) Attention to doors and starting signals and being quick with change, causing motormen not to lose time and so not requiring more power to make it up.

(2) Turning off lights and heaters whenever possible.

(3) Removing trolley pole as soon as car is placed in carhouse.

(4) Calling names of streets. This gets the passengers to the door ready to get off when car stops.

(5) Looking ahead when car slows up or when motorman strikes gong and being ready to give go ahead signal if car shall pass obstruction.

(6) Reporting as soon as possible everything that might cause a delay.

(7) Opening back doors when several passengers are leaving car.

(8) Being alive at all times to methods of avoiding delay; the more time wasted, the more power wasted.

In the Shops and Carhouses

Repair Men Can Save Coal by

(1) Adjusting brakes so that the full efficiency of the brakes is obtained and yet so they do not hold the shoes tight against the wheels when brakes are released.

(2) Keeping all bearings and rubbing parts clean and well lubricated; this decreases friction and therefore the power required.

(3) Adjusting controllers so that a motorman can feed them properly, seeing that all connections are tight and that no arcing takes place when handle is moved on or off. A controller which is arcing causes a motorman to lose time and so wastes power.

(4) Seeing that all air leaks are taken up, that all packings are tight, that the motorman's valves work freely, and that the governors are set with the proper margin of variation.

(5) Keeping sand boxes full, also that sanding apparatus is in good working order and sand pipes over the rail.

(6) Adjusting trolley base tension properly, seeing that collector springs bear on wheels; that bushings are not badly worn. Defects in trolleys cause delays and so force the motormen to use more power to make up for lost time.

(7) Adjusting foot gongs so that they ring loud enough, and so that foot plugs do not stick or jam.

(8) Sectioning resistances so that the car shall start smoothly. This is most important.

(9) Keeping all insulation in good condition, so there shall be no leakage of current when car body becomes wet.

(10) Avoiding unnecessary shifting of cars in shops.

(11) Turning off all unnecessary lights, compressors and heaters, and shutting down all machinery running idle.

(12) Adjusting circuit breakers to act at proper current value. Defective circuit breakers waste time and so waste power.

(13) Not causing cars to be held at carhouses, waiting for cars from shop.

Cleaners and Others
Can Save Coal by

(1) Turning off lights and heaters whenever possible.

On the Road

Line Men Can Save Coal by

(1) Avoiding unnecessary mileage of line cars or trailers.

(2) Having all feeder taps and ears tight. Loose connections mean increased resistance and so loss of power.

(3) Adjusting all circuit breakers in feeder jumpers so that they do not act at too low a current value, thereby causing unequal voltages.

(4) Insulating feeders that pass through branches and foliage of trees. This will prevent slight leakages of current.

(5) Keeping electric switches in working order, as there is a large amount of power wasted by motormen when switches operate sluggishly.

(6) Setting overhead work so as to reduce number of dewirements.

(7) Using lights and heaters in line cars only when necessary.

(8) Not holding cars more than necessary at places where gangs are working.

Line Repair Men Can Save Coal by

(1) Seeing that defective feeders are promptly repaired.

(2) Seeing that lamps and heaters in line cars and linemen's quarters are turned off when not actually required.

(3) Using automobile tower trucks, when they are available, in preference to line cars.

(4) Using the lowest permissible wattage lamps in lamp banks, waiting stations, etc.

(5) Removing trolley poles from trolley wire when cars are not in use in carhouses and yards.

Roadmasters and Track Men
Can Save Coal by

(1) Caring for bonding, seeing that no bonds are loose or broken.

(2) Operating welding, grinding and tamping machines as economically as is possible, and seeing that they are in good condition.

(3) Avoiding unnecessary mileage of work cars.

(4) Not holding cars longer than necessary at points where gangs are working.

(5) Keeping curves and special work well greased.

(6) Removing flags used to protect workmen as soon as possible.

Dispatchers, Inspectors, Starters
and Instructors Can Save Coal by

(1) Not causing unnecessary mileage.

(2) Observing car defects and reporting them as soon as possible.

(3) Seeing that lights and heaters are in use only when necessary.

(4) Cautioning or advising car crews, when observed to be operating improperly.

(5) Pointing out to new men or others whom they instruct the necessity of economical operation.

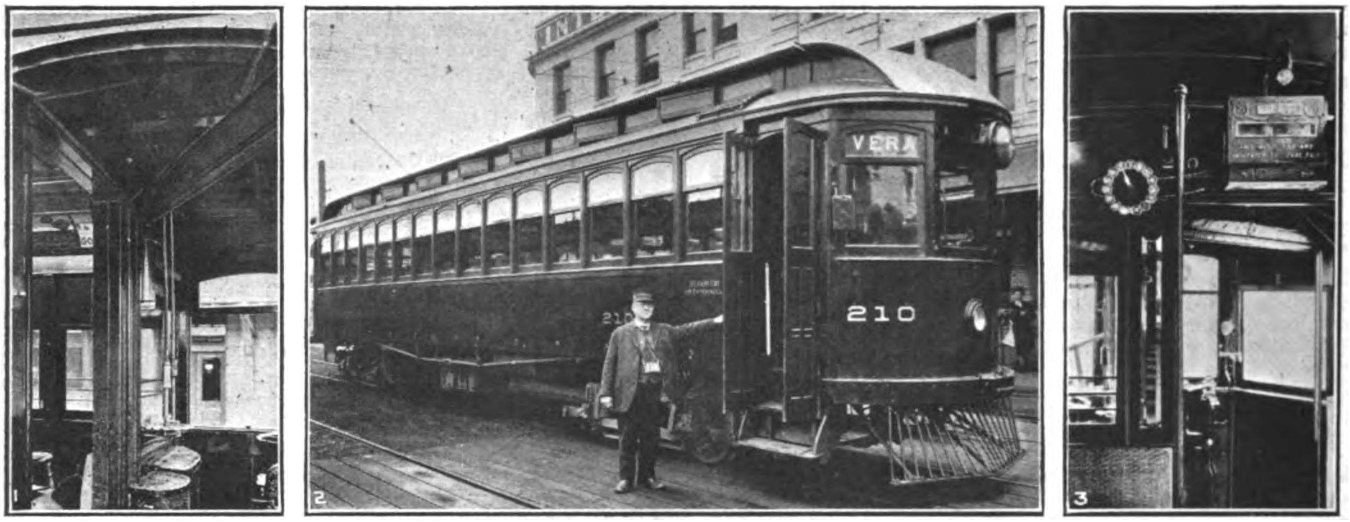
Other Employees in Offices and
Elsewhere Can Save Coal by

(1) Being near exits when car is stopping, so as to avoid delay.

(2) Setting example to other passengers in regard to being at proper stopping places, and in other ways so acting as to avoid delay.

(3) Reporting anything noticed which may cause delay, for delay in the end always means more power to make up for lost time.

(4) Not using lights or heaters in offices when not necessary.



LEFT—INSIDE MOTORMAN'S CAB, SHOWING REGISTRATION DIAL AND VERTICAL RODS. CENTER—ONE OF THE SPOKANE CARS IN SERVICE. RIGHT—REGISTER AND DIAL ON BULKHEAD INSIDE CAR

One-Man Interurban Cars Used in Spokane

The Spokane & Eastern Railway Has Remodeled Several of Its Interurban Cars to Permit of One-Man Operation—Competition from Buses Made Economical Operation a Necessity

ONE-MAN interurban cars to compete with one-man interurban motor buses have been introduced in Spokane by the Spokane & Eastern Railway with good results. Motor buses have invaded the territory of the Spokane & Eastern interurban lines both east and south of Spokane and particularly between the city and Liberty Lake. It is on this run that the company is introducing one-man interurban cars.

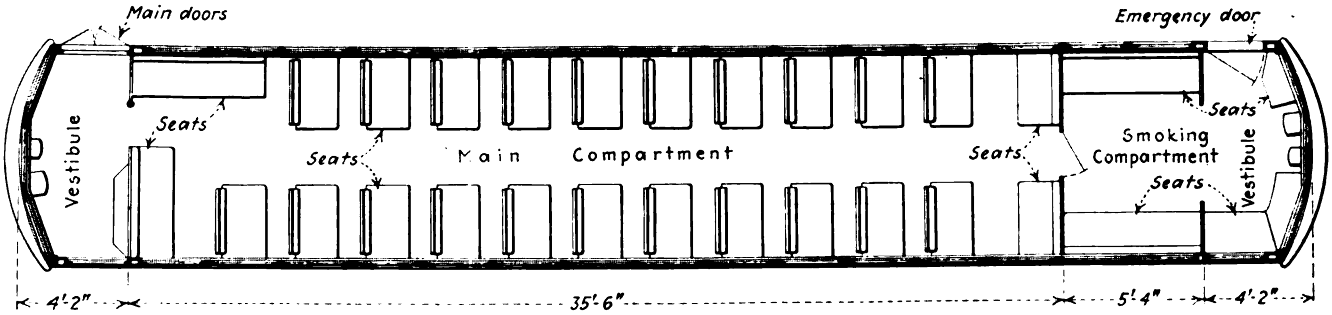
The Spokane & Eastern interurban cars were built here two years ago in the company's shops. New trucks and electrical control were installed. These cars have now been rebuilt for one-man operation. During the reconstruction the cars were "turned around"; that is, the motorman's cab was constructed on the rear vestibule of the old cars.

One of the remodeled cars is shown in the accompanying illustration. They are 52 ft. 7 in. long, 8 ft. 6 in. wide and 8 ft. 6 in. high, inside. The seating capacity is sixty-five passengers and the standing capacity about 110.

The car will make the 19 miles to Liberty Lake, with twenty-one flag stops, at an average of 18.95 miles an hour. The maximum speed will reach 30 to 35 miles an hour between stations. Hourly service is scheduled for the line. Five one-man cars are now completed and seven more will be added to the service in a short time. The company has also reconstructed several of its old two-man cars into the one-man type with a motorman's cab at each end. The reconstruction of all cars was done under the direction of Superintendent J. F. Gannaway and A. H. Mayham, master mechanic for the Spokane & Eastern shops.

In order to facilitate the rapid handling of fares and tickets and to assist the auditors of the company in analyzing the day's business the Ohmer fare register, No. 60, was installed in the cars, as shown in the illustrations. Two dials are used for indicating the registration. One of these is located inside the motorman's cab in a horizontal position on the bulkhead just at the bottom of the window. The other is located at the top of the bulkhead inside the car. When a fare is received the operator sets the dial in his cab according to the fare to be registered. Two vertical rods connect this dial with the one inside the car so that the indications are the same on the two dials. The registration is made by pulling down on the handle which slides on one of the vertical rods. This system has proved very satisfactory.

Twelve Ohmer registers of the new No. 62 model have been ordered by the company for use on this type of car. The arrangement in the motorman's cab and in the passenger compartment is practically the same, but the register is built to record any amount from one cent to $9.99 and nine separate ticket fares. In addition, each station is given a zone number, and from this the auditors can ascertain the record of passengers picked up at each station. A record is automatically made of the zone number, the direction of the car, the register number, the amount of cash received or ticket fare, a consecutive fare number, the date and the conductor's number.



FLOOR PLAN OF ONE-MAN INTERURBAN CAR

Relation Between Temperature and Power Used by Electric Cars

Tests Indicate That More Power Is Used During Cold Weather—Present Methods of Lubrication Appear to Be Responsible for a Large Part of the Increase

By A. W. Baumgarten
Electrical Engineer Chicago & Joliet Electric Railway, Joliet, Ill.

IN THE past few years much time and study have been devoted to obtaining more efficient operation in order to reduce the power costs of electric railways. Railways are now realizing that the weight of the heavy type cars is responsible for a large part of the power cost, and they are resorting to the lighter type car to save power. However, most of the methods used to improve power efficiency and savings involve a large expenditure of money and consequently most of the railways are not in a position to adopt them.

One very successful method of obtaining power efficiency in use on many properties today is to improve the operating efficiency of their motormen by the use of meters installed on the cars. This does not involve a very large financial investment, and it offers a very good means of studying other faults involved in car operation and maintenance.

The writer has had the opportunity of studying and instructing carmen in the operation of cars through the use of watt-hour meters installed on the cars for the past seven years with good results. The watt-hour meter has also been used to check up the adjustment of equipment. For instance, too much stress cannot be put on the proper adjustment of brake equipment. It has been found that a car can easily use 10 per cent to 25 per cent more power than necessary by having tight or unequal brake adjustment and causing large friction losses. We must bear in mind that every foot-pound of energy expended in friction must come from the trolley.

A very interesting problem which the writer observed, and which has probably not been seriously considered in connection with car operation heretofore, is the effect of temperature on the energy per car-mile. In order to determine the effect of temperature alone, it was necessary to study the effect of passenger loading.

To do this, graphs similar to those in Fig. 1 were plotted for a period of several months showing the average kilowatt-hours per car-mile for the system, the average atmospheric temperature, and the passengers per car-mile for each day.

Table No. 1 was obtained from these graphs by recording the kilowatt-hour per car-mile and passengers per car-mile for each of the temperatures given, and by calculating an average for each temperature.

Table II was obtained by taking the kilowatt-hours per car mile and the temperature for various loading of passengers per car-mile in groups from 3.60 to 4.20 passengers per car-mile, and an average calculated for each group. The figures thus obtained were then corrected to 30 deg. and 75 deg. temperature from a preliminary curve plotted from Table I, and the corrected values are given in Table II.

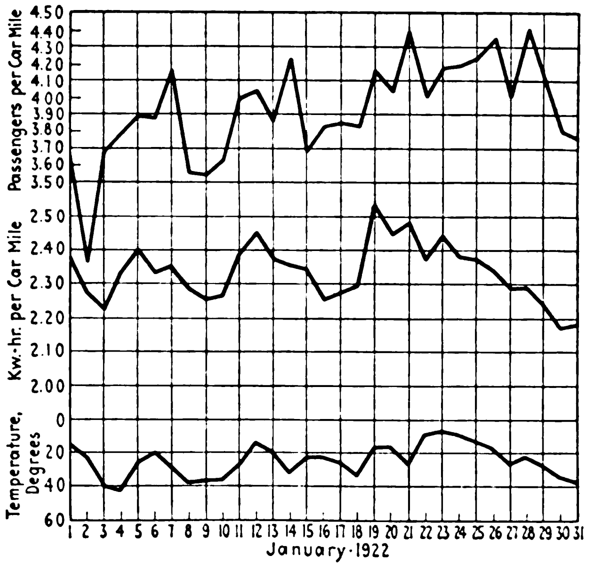


FIG. 1—TEMPERATURE. POWER CONSUMPTION AND PASSENGERS CARRIED DURING JANUARY, 1922

These figures were plotted giving the two curves at 30 deg. and 75 deg. temperature, the points of which are shown in Fig. 3.

From these curves the figures of Table I were corrected for a uniform loading of four passengers per car-mile as shown in Table III.

These figures were then plotted as shown in Fig. 2. The other curves for each 5 deg. change of temperature on Fig. 3 were interpolated from Fig. 2. It is interesting to note that the effect of passenger loading on the power per car-mile becomes less at the lower temperatures—that is, the slope of the curve becomes less and approaches zero. Although the power per car-mile from the curves of Fig. 3 probably will not apply to other properties, it will be found that the rate of change

TABLE I—RELATION OF POWER CONSUMED IN OPERATION TO TEMPERATURE

Atmospheric Temperature, Degrees F	Average Passengers per Car-Mile	Average Kilowatt-Hours per Car-Mile
15	4.01	2.410
20	3.92	2.380
30	3.86	2.320
40	3.82	2.240
55	3.96	2.120
65	3.79	2.070
75	3.87	2.080
81	3.86	2.030

TABLE II—AVERAGE POWER CONSUMED AT TEMPERATURE OF 30 AND 75 DEGREES F.

Passengers per Car-Mile	Temperature, Degrees F.	Average Kilowatt-Hours per Car-Mile	Temperature, Degrees F.	Average Kilowatt-Hours per Car-Mile
3.60	30	2.280	75	2.03
3.70	30	2.290	75	2.045
3.80	30	2.300	75	2.052
3.90	30	2.290	75	2.065
4.00	30	2.310	75	2.075
4.10	30	2.312	75	2.082
4.20	30	2.320	75	2.093

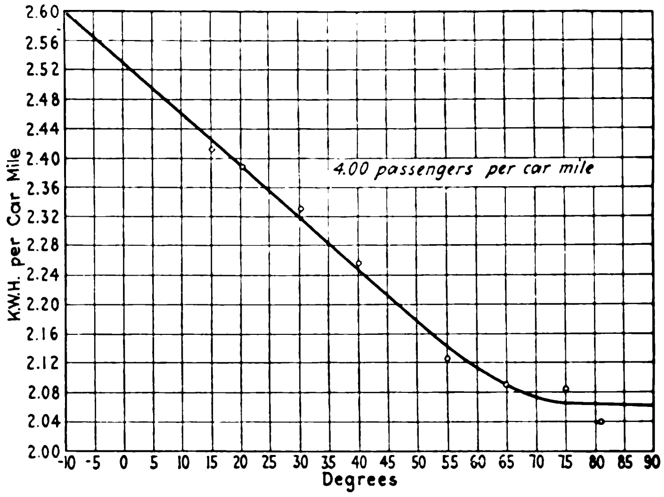

FIG. 2—POWER USED PER CAR MILE WITH VARIATION OF TEMPERATURE

of energy per car-mile with the atmospheric temperature and with the passenger loading will be about the same.

As to the causes of this variation of power with temperature, it is the writer's opinion that present methods of lubrication are responsible for a large part of the power loss. It is not only the quantity of lubricant but the quality and physical properties as well that causes this rapid increase of power at the lower temperatures. With lubricants of lower viscosity and with a lower cold test than those in present use which will at the same time withstand the bearing pressures, we should be able to reduce the slope of the power—temperature curve and effect considerable savings of power.

TABLE III—RELATION OF POWER CONSUMED TO TEMPERATURE WITH UNIFORM LOAD

Atmospheric Temperature, Degrees F	Average Passengers per Car-Mile	Average Kilowatt-Hours per Car-Mile
15	4.00	2.410
20	4.00	2.385
30	4.00	2.330
40	4.00	2.255
55	4.00	2.125
65	4.00	2.090
75	4.00	2.085
81	4.00	2.040

In the automobile industry the manufacturers endeavor to lubricate every part where friction occurs—not as little as possible, but all that each part will take without undue loss of oil. With railways it has been the custom to do as little lubrication per 1,000 car-miles as possible, without consideration of the power losses.

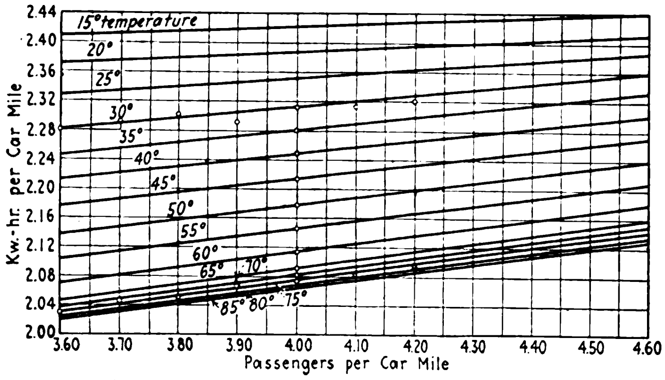

FIG. 3—POWER USED WITH VARIATION OF TEMPERATURE AND PASSENGERS CARRIED

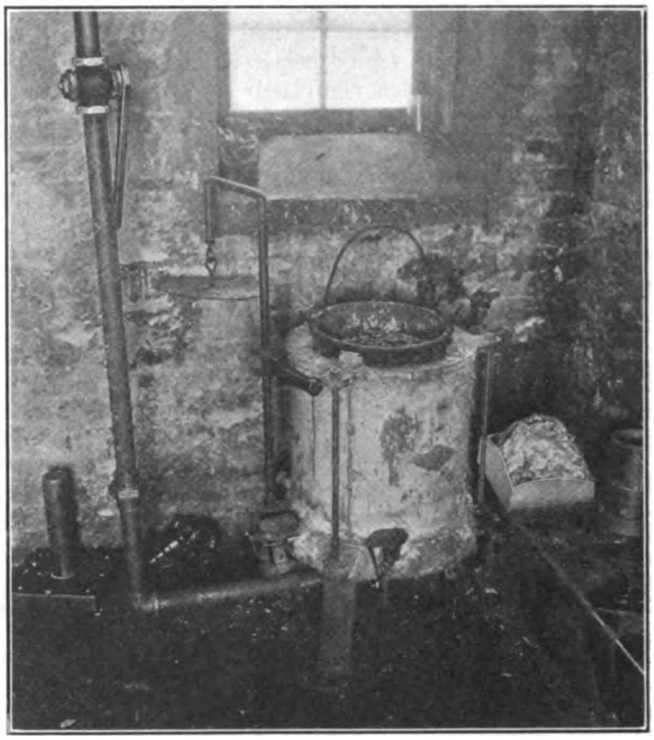
The majority of hot journals and bearings occur in the cold weather which in itself is an indication of poor lubrication due to the low temperature at which the oils do not feed properly. Also there are many parts such as parts of the brake rigging of the railway car which is lubricated very little or not at all, causing the brakeshoes to drag against the wheels with high friction losses because the release springs cannot react properly. The writer has observed losses of 50 to 75 kw.-hr. per car per day for this reason alone.

Therefore, it seems possible that considerable saving of power and equipment can be accomplished by a change of lubrication methods at very little additional cost.

Convenient Babbitting Furnace

THE accompanying illustration shows a Johnson direct-jet No. 600 furnace used in the shops of the Eighth Avenue Railroad, New York, for melting babbitt. It also has been found convenient for tempering, case hardening and annealing, as well as for soft metal melting. The furnace proper is 18 in. high and sets on three legs, which raise the bottom 10 in. from the floor. This gives an over-all height of 28 in. An attachment at the side supports a cover for the melting pot and a wooden handle at the side provides for swinging this out of the way as required. The furnace is of sufficient size to take a 400-lb. melting pot, but a size holding from 200 to 350 lb. is used by the Eighth Avenue Railroad. The gas supply pipe is 1¼ in. in diameter, and is provided with a shut-off cock which can also be used to regulate the supply. The furnace is fitted with six Johnson direct-jet atmospheric burners which mix the right amount of air with the gas to produce complete combustion and to obtain the maximum heat possible without the use of a forced air blast. This type of jet directs the flame in correct alignment with the Bunsen, and maintains the highest possible velocity at the nozzle. The orifice is adjustable, as is necessary to provide for variations in the pressure of gas.



FURNACE USED FOR MELTING BABBITT

The gas consumption is 75 cu.ft. an hour, and the furnace will melt 350 lb. of babbitt in fifty minutes. Other soft metals, such as lead, zinc, and tin, can also be efficiently melted if desired.

Equipment and Its Maintenance

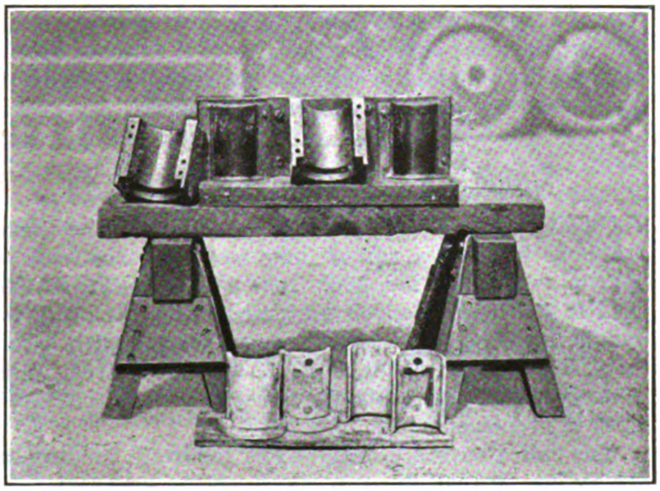
Short Descriptions and Details of New Apparatus of Interest to the Industry. Mechanical and Electrical Practices of All Departments

Aluminum-Base Metal for Motor Bearings Gives Low Cost

Use of This Material in Youngstown Involves a Net Cost Lower than for Bronze, with Equivalent Wear During a Year's Test

By A. B. Creelman
Master Mechanic Youngstown (Ohio) Municipal Railway

ABOUT four years ago when it was difficult to get bronze a set of four molds was made up with which to pour solid babbitt bearings for G.E.-247 motors. After trying out a dozen different brands of ordinary babbitt metal, this practice was given up as too expensive, for many of the bearings were too hard and broke and others failed because the babbitt was too soft. Since that time, an aluminum base material, called "Elmore U. S. metal," has been tried for motor bearings and it has worked out satisfactorily. Bearings of this material have been in service for about a year on the motors of twelve cars and they are apparently giving as good wear as the bronze bearings.



Molds for Casting Finished Babbitt Motor Bearings

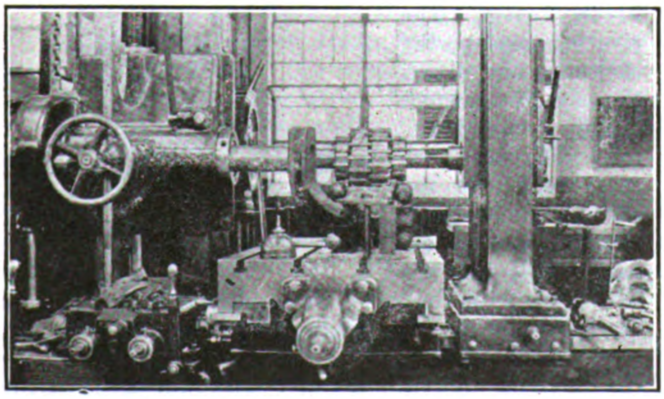
The net cost of bearings made with this aluminum base is about 12 per cent of bronze bearings. Bronze bearings cost $5.30 per pair for labor and material and have a scrap value of 70 cents, leaving a net cost of $4.60 per pair. The aluminum-base babbitt bearings cost $2.70 a pair and have the high scrap value of $2.16, since the material can be remelted. Therefore the cost of the useful wear in a set of these bearings is only 54 cents.

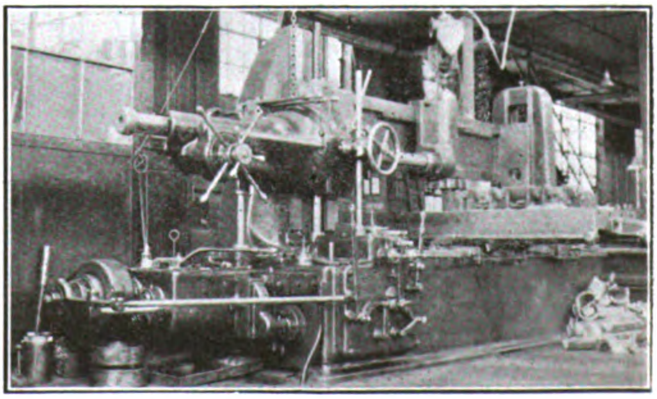
The molds into which these bearings are poured are so arranged that the bearings require no machine work after they are cast. After they are merely cleaned up around the edges on an emery stone, they are ready for service in the motor. When the motor axles are badly worn some breakage has occurred with both bronze and babbitt bearings, but when the bearing and the axle have a snug fit the aluminum babbitt metal is showing just as good service as the bronze. Since the test on these twelve cars is not yet completed, it is not possible to give figures as to the exact performance cost per thousand car-miles.

Milling Pedestal Jaws

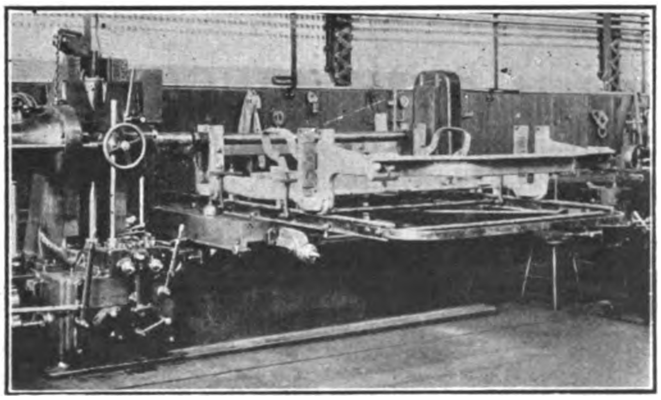
Special Frame Fitted to Horizontal Boring Machines for This Work—Machine Also Adaptable to Many Other Types of Work

A HORIZONTAL boring, drilling and milling machine, which has been in use for a number of years in the Harvard Shops of the Cleveland Railway, has been found to be one of the most valuable of any of the machine tools installed. The adaptability of this tool is such that it can be set up for a number of jobs that must be done in an electric railway shop, but which usually require the use of a number of separate machine tools. Three of the accompanying views show as many distinct operations for which the machine is ordinarily employed. The first of these illustrates the set-up of the machine for milling the pedestal jaws of a truck frame to the correct width so that wearing plates can be inserted between the jaws and the





At Left, Milling the Pedestal Jaws of a Truck Frame with a Horizontal Boring, Drilling and Milling Machine. At Right, Milling Axle Caps for Dowels



PLANING AXLE BRASSES

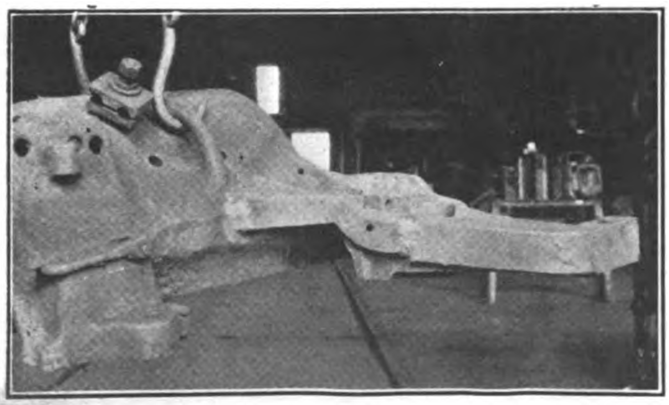
journal box. For this particular work, a special frame on which to mount the work has been constructed from two lengths of rail and several rods. The base of one rail is secured to the platen while the other rests on the base of the back rest. The truck frame is held down with pins, eyebolts and plates connected as shown. The horizontal milling attachment, consisting of two cutters mounted on an arbor, is used, thus making it possible to resurface the corresponding sides of opposite pedestal jaws simultaneously. To bring the other pair of jaws into position for milling, the auxiliary and truck frame must be turned end for end.

A simpler operation performed on this machine is the milling of axle bearing caps for dowels as shown in an illustration. The back rest is moved up to the platen and a gang cutter mounted on a short arbor is inserted in the driving spindle.

A third set-up, one for planing axle brackets, is also shown in an accompanying illustration. For this job, the vertical milling attachment is inserted between the head and back rests and a shell-end cutter is used. Work of this sort is done principally to fill in among the more difficult milling operations, for which the tool is especially adapted.

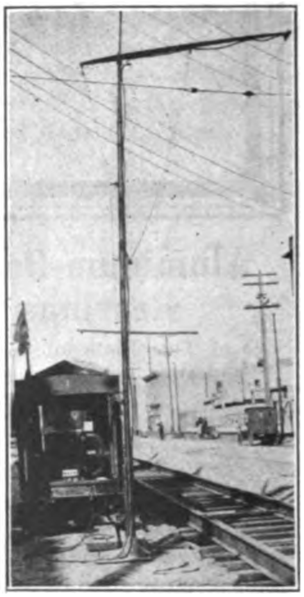
There are three other distinct operations which are customarily done on this machine but which are not illustrated herewith. These are the drilling and facing of car couplers, the lining up and tightening of armature cores which have become loose and skewed on the spiders, and the reboring of motor housings which have been repaired by welding. One of the illustrations shows a repaired motor casing which has been welded across one bearing and is ready to be rebored. More than 100 housings have been welded and machined thus without single failure.

The Lucas Machine Tool Company, Cleveland, is the manufacturer of this horizontal boring machine.



WELDED MOTOR HOUSING READY TO BE REBORED

Tapping Trolley Wire Without Interrupting Car Traffic

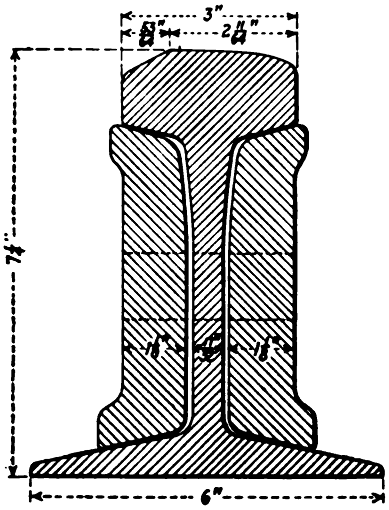


TAKING CURRENT FROM TROLLEY WIRE IN SAN FRANCISCO

A PORTABLE equipment for making contact with the overhead trolley wire in order to obtain current for operating tools for track repairs has been built by the Market Street Railway of San Francisco. This trolley wire tap is arranged so that it is not necessary to remove the device when a car passes. The device consists of a broad based steel standard, which can be set at a proper distance from the track. This has an arm at the top of sufficient length to extend to the trolley wire. At the outer end of the arm is a contact plate which fits about the underside of the wire so closely that it does not interfere with the passing of a trolley wheel. Ropes are provided for adjusting the arm to the proper height, and the current is carried by cable from the contact to the machinery to which power is supplied.

Novel Rail Section for Cleveland

THE Lorain Steel Company is rolling for the Cleveland Railway a rail of new section, which will be known as Sec. 102 No. 506. It is a modification of Sec. 95 No. 400, with the web thickened under the head, the height increased ¼ in. and the head formed with a contour like that of the A. E. R. A. standard girder rails. This section is added to the present series; that is, it does not replace another.



RAIL AND JOINT-PLATE SECTION LORAIN 102-506 NOW BEING ROLLED FOR CLEVELAND

The splice bars are designed to facilitate welding, as they are used in making what is known as the C. H. Clark joint. The bars clear the rail web by about 1/16 in.

In Cleveland the joints are made with 8-hole plates, riveted together with 1 1/16-in. Myari steel rivets 5¼ in. long. The riveting takes up the clearance and draws the bars to a perfect bearing top and bottom. The plates are seam-welded to the rail top and bottom. Base plates underneath the joints are used also, with the rail base welded to the plate. Mr. Clark reports that the joints so far installed are giving good satisfaction.

In making the joints the Cleveland Railway is cutting the rail ends on a 10-deg. miter.

Combination Rest Room and Repair Shop Under Ferry Loop

THE accompanying illustration shows the entrance to the repair shop and rest room for railway employees which has recently been built under the ferry in front of the ferry building in San Francisco. This space was previously occupied by an old cable car loop pit, and half of the space available has now been transformed into the rest room and repair shop. There are lockers for the men with wash rooms, etc. The entrance is closed by two steel doors, around which there is a pipe railing. Access to the rest room is gained by means of a steel ladder. A large electric gong is installed at the opening for calling various employees, such as superintendents, inspectors, repairmen, starters, etc., each of which has a code number.

ENTRANCE TO REST ROOM AND REPAIR SHOP UNDER FERRY LOOP

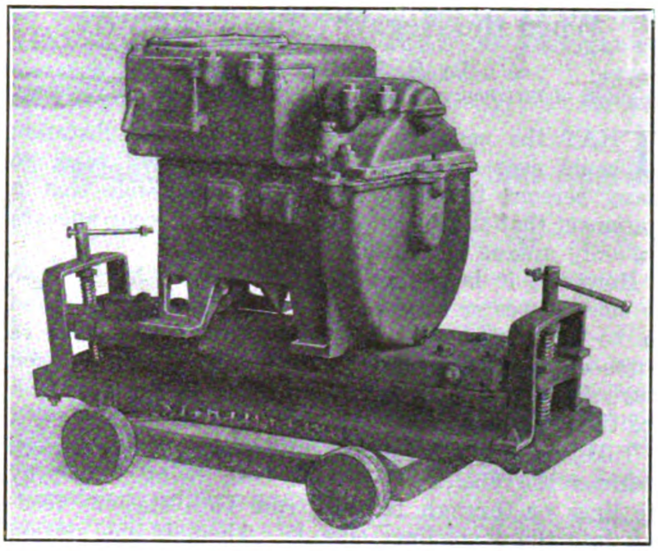
A Convenient Compressor Truck

The New York State Railways Has Supplied Its Maintenance Shops with a Platform Truck with Movable Table for Removing and Reinstalling Compressors on Cars

THE accompanying illustration shows a type of truck constructed in the shops of the New York State Railways and used for removing and reinstalling compressors on cars. This truck has a platform which can be raised and lowered by means of screws at either end, so that a compressor can be lowered from its position on the car body sufficiently to clear any obstructions and then be hauled away to the compressor overhauling bench by one man.

The frame of the truck is made of 1-in. x 2-in. channel irons and is $22\frac{1}{2}$ in. wide x 31 in. long. Two axles are located 4 in. from the ends of the frame by boring holes in the channel iron framework. The axles are clamped to the frame. The wheels are 6 in. in diameter and 2 in. wide, made of wood with band iron tires and steel bushings in the center to serve as bearings. They are fastened on the axles by means of cotter pins.

The stationary platform is made of oak $13\frac{1}{2}$ in. wide x 47 in. long x $1\frac{3}{4}$ in. thick. This is securely bolted to the channel-iron framework. The raising and lowering table is also made of oak 12 in. wide x 37 in. long. It is raised and lowered by means of two small screws at the ends of the table. These screws are $1\frac{1}{8}$ in. in diameter and 8 in. long. They are threaded four threads to the inch and have a large nut $1\frac{1}{2}$ in. x $2\frac{1}{2}$ in. x 8 in. at either end, which works up and down between guides as the screws are turned. The ends of the table rest on two pieces of strap iron, which in turn rests on the nut, so that the table is raised or lowered as the screw is turned. As constructed the table has a range of 8 in. in travel, which has been found ample for removing all ordinary compressors from cars. The general details of construction are shown in the accompanying illustration.



COMPRESSOR TRUCK WITH RAISING AND LOWERING TABLE

Construction of Edinburgh's Overhead Line Finished

AS already announced in these columns, the Edinburgh Corporation Tramways is changing to overhead current collection. The acompanying illustration shows the connecting up of the final section of its first overhead electric line.

TOWER TRUCK CREWS COMPLETING EDINBURGH'S OVERHEAD LINE

When the Negative Bus Is Positive

By G. H. McKelway
Engineer of Distribution, Brooklyn (N. Y.) Rapid Transit Company

THAT the negative bus of a power or substation could ever be positive to anything will seem to many persons to be so manifestly impossible that a statement that such a condition does often occur appears not only untrue but absurd as well.

However, it is a fact that on systems having two or more power or substations there will often be found to be differences of potential between the negative buses of the different stations, which is only another way of saying that some of the negative buses will be positive to others.

Take, for instance, a system of lines fed from two stations the positive buses of both being joined by tie lines or through feeders from both stations feeding into the same lines outside. Then, if one station should be shut down, but its bus kept alive from the other station by means of these ties, current would still continue to flow out from the positive bus through its feeders and much of this current would return to the negative bus of the idle station, although all of it, eventually, would return to the negative bus of the station where it was generated. Therefore, at the station that had been shut down, there would be found to be current returning to the negative bus over certain of the return wires, and leaving that bus for the negative bus of the generating station over other return wires.

In the same way, although not so obvious, it will be found that it is not necessary for one of the stations to be entirely shut down before the potential of its negative bus is higher than that of a neighboring station, but that it will be necessary only that one station lower its voltage enough to permit the other to pick up a part of what would normally be the first station's load, and the same condition will occur although much less noticeably.

In fact, with two or more stations close together and all feeding into approximately the same lines, the fluctuations of voltage caused by ordinary variations in load will be sufficient to cause current to flow out from the negative bus many times in a day.

This fluctuation of voltage and current flow makes it unwise, on a large system, to follow the same practices for the prevention of electrolysis of the cable sheaths that are considered as standard on smaller roads. On a small line the cable sheaths are generally bonded to the negative bus of the station and that is all that it is considered necessary to do to prevent any trouble. But, as has been shown above, on a larger system it is not certain that such drainage will prevent electrolysis. On the contrary, at some hours of the day, the cable sheaths, if connected to the negative bus, may furnish a path whereby current may leave that bus and, after following the sheaths for some distance, leave them at some remote point or points and there cause more trouble than would have occurred if the sheaths had not been bonded.

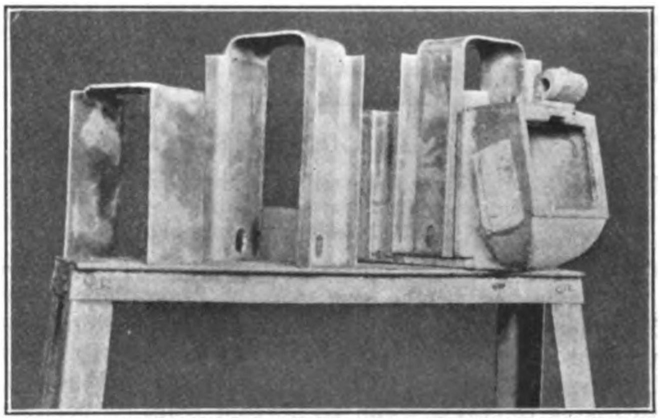
Therefore on many of the larger systems it is no longer the practice to attempt to drain the sheaths of negative current by bonding them "hard" to the negative bus, but instead a switch is placed in the circuit so that it will or can be opened when the direction of current flow changes.

These switches are sometimes automatic but more often are merely the ordinary hand-operated knife switch which is opened whenever the station is shut down or when the ammeter in the circuit shows that current is leaving the bus. Where such ammeters are used on the negative side as well as on the positive it is the custom to have them read at regular intervals and the readings recorded on the regular feeder sheets just as is done with the readings of the ammeters on the feeder panels.

The use of portable recording instruments of the smoked chart type, if occasionally put into the circuit, will show that often when the ammeters of the ordinary switchboard type are not sensitive enough to record any current, the voltage on the bond wire will be fluctuating, the readings showing that part of the time the potential of the negative bus is higher than that of the cable sheaths, and vice versa. The writer knows of one occasion when simultaneous readings on the bond wires leading to the negative bus from the high and low tension cables at one station showed that current was coming into the station on the sheaths of the d.c. cables, which ran out principally in one direction, and was leaving the station on the sheaths of the a.c. cables which ran to another station in a different direction.

Renewable Wearing Plates for Both Journal Boxes and Truck Frames

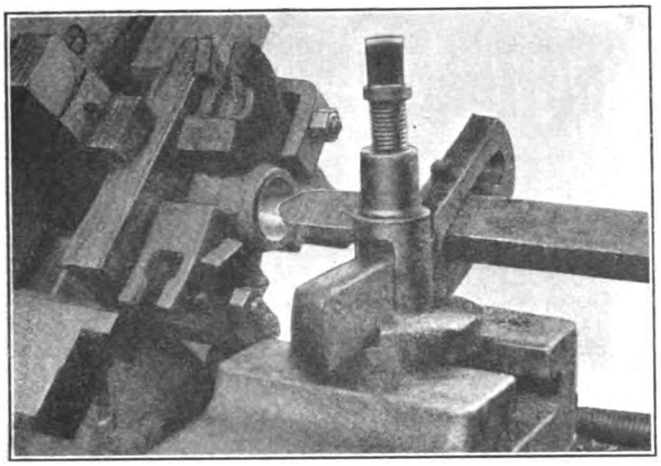
FOR a number of years the cars of the Cleveland Railway have been equipped with double wearing plates between the journal boxes and sides of the truck frame jaws. Both of these plates are continuous, being stamped from ⅛-in. sheet steel strips and bent to form U-shaped pieces. One pair of plates is slipped over the journal box and is held in place by the journal box guides. The outer pair of flanged plates is bolted to the truck frame jaws. The tops of these two renewable wear plates form the bearing surfaces for the coil spring over the journal box inserted between them. Thus these plates are held from rattling by the weight of the car, a scheme which has worked out with considerable success. Protecting the wearing surfaces of both the journal box and of the yoke means that the life of these parts has been materially increased at a small cost.



RENEWABLE WEARING PLATES FOR JOURNAL BOX AND TRUCK FRAME JAWS

One set of these plates before assembling and another set assembled on a journal box are shown in the accompanying illustration. The pair of plates on the left was formed by using a bulldozer, while the other pair was formed in a press with a set of dies.

Handy Jig for Boring Brakeshoe Heads



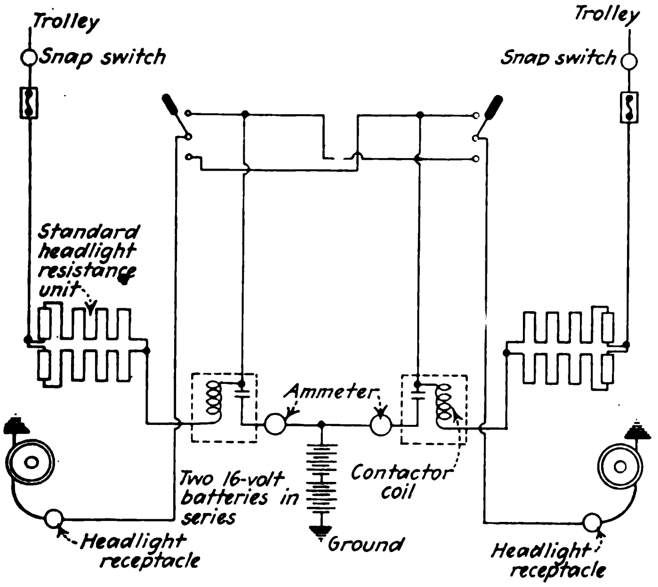
LATHE SET UP FOR BORING BRAKESHOE HEAD

THE accompanying illustration shows the set-up in a lathe of a brakeshoe head for boring as used in the shops of the Northern Ohio Traction & Light Company, Akron, Ohio. The brakeshoe head is clamped to an iron block by two clamps at either end. The block is then placed in the chuck of the lathe and adjusted to its proper position.

Headlight Circuits with Storage-Battery Booster

IN ORDER to overcome varying intensity of headlights, due to fluctuation of line voltage, the San Francisco & Sacramento Railroad has connected its headlights with a storage battery in circuit, as shown in the accompanying diagram.

With this arrangement, the battery is charged at about 1 amp. when trains are in front of substations and discharges about 2 amp. when the voltage is low between stations. Standard 32-cp., 250-volt locomotive-type lamps are used in "Golden Glow" 14-in. reflectors, which provide a light that illuminates an 80-ft. right-of-way clearly for 1,000 ft. and is not affected by voltage fluctuation either in starting or in running. This arrangement has been in operation about six months on trains operating altogether at night. Arrangement has been made in this circuit to use the headlight resistance as cab heaters for the motormen and to permit selection of either resistance from both ends of the car.



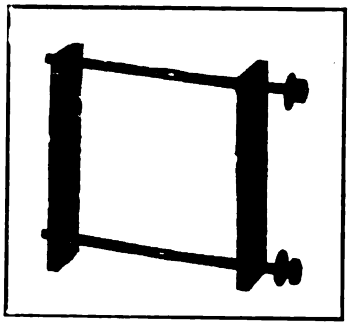
WIRING DIAGRAM FOR BATTERY HEADLIGHTS

Eliminating Controller Connection Boards

By W. B. UFFERT

Master Mechanic New York & Harlem Railroad, New York, N. Y.

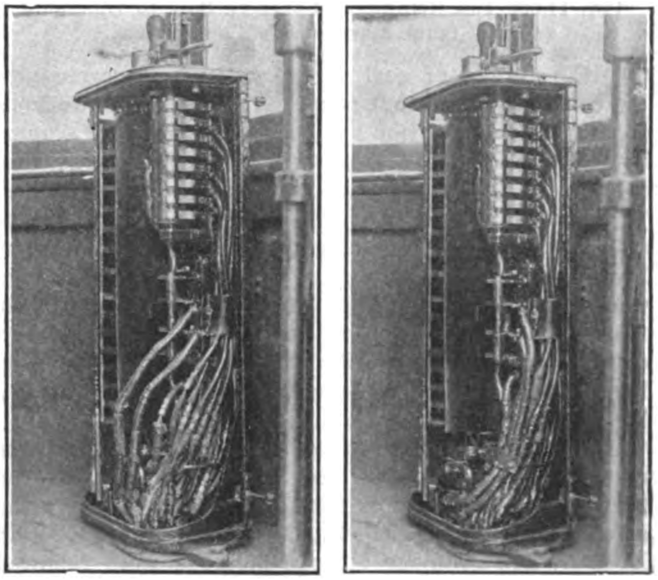
THE New York & Harlem Railroad has a number of old-style type "K" controllers in service. Considerable trouble was caused from open circuits and short circuits at the connection board. The terminals were of the screw type, and due to screws working loose, poor contact resulted which caused burning, short circuits and even controller explosions. Due to the cramped condition where the leads came in, it was almost impossible to keep these free from dirt, and the dampness and carbonized terminal conditions caused a creepage of current which ultimately resulted in short circuits. It was also very difficult to make a good soldered joint, due to the limited space available.



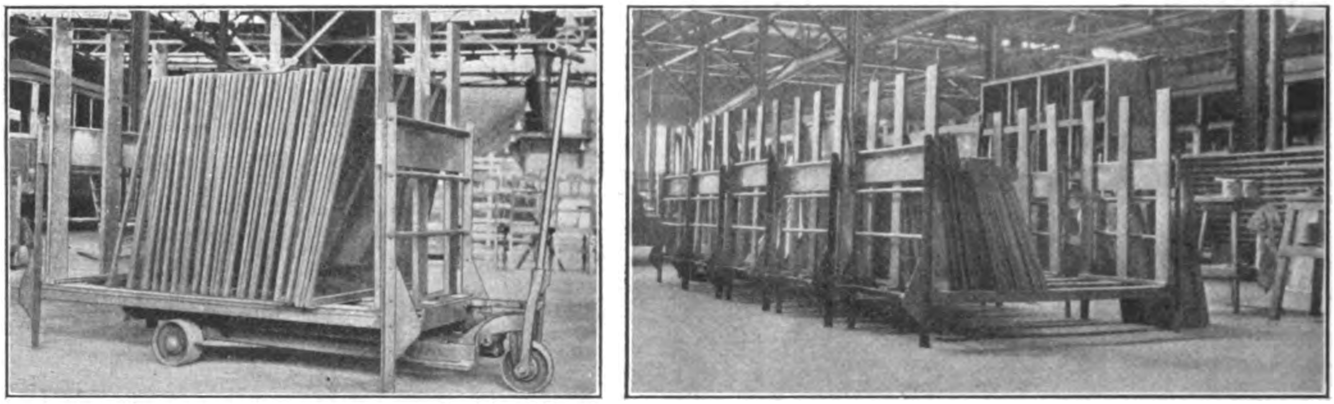
CLAMPING BLOCK USED TO SECURE LEADS

To remedy this condition, the connection board was cut off and the lower section which had the connecting terminals was removed. The upper section on which was mounted the motor cut-out switches was not disturbed. To connect the incoming leads from the motors and resistors to the controller leads, Frankel two-way soldered connectors were used. These permit the cables to run straight and their use provides a positive joint.

Accompanying illustrations show how these connectors are used for making the connections and also how the leads are taped and clamped in place. After the connectors have been installed, the joints are thoroughly taped up and grouped in proper position. Clamping screws with fiber blocks hold the leads.



AT LEFT, LEADS CONNECTED WITH CONNECTIONS. AT RIGHT, FINISHED INSTALLATION OF LEADS IN CONTROLLER



At Left, Car Windows Loaded on Special Frames Are Handled with a Lift Truck. At Right, the Sash Belonging to Each Car Is Kept on a Separate Rack

Sash Handled with Racks and Lift Truck

AN EFFICIENT system for handling car windows while the cars are undergoing repairs or are being painted has been in use for some time in the Harvard shops of the Cleveland Railway. As the windows are removed from the cars which are being stripped in preparation for washing and painting, they are loaded on a rack as shown in an accompanying illustration. A hydraulic lift truck is then run under the loaded rack and the two units are transported ensemble to the paint shop from the wash house. The car number chalked on the rack identifies the sash.

The loaded racks are lined up in a space provided for them in the paint shop as shown. They are then taken from these racks, cleaned, painted and stored in drying frames. When the paint has dried, the sash is replaced on the same rack, when the lift truck is again brought into play to transport the refinished sash to the car.

For this purpose about eighteen racks are employed with but one truck to move them about. Steel angle irons form the vertical and horizontal members of each frame, to which is bolted an inner wooden rack. They were built in the railway shops.

Underwater Coal Storage in the Twin Cities

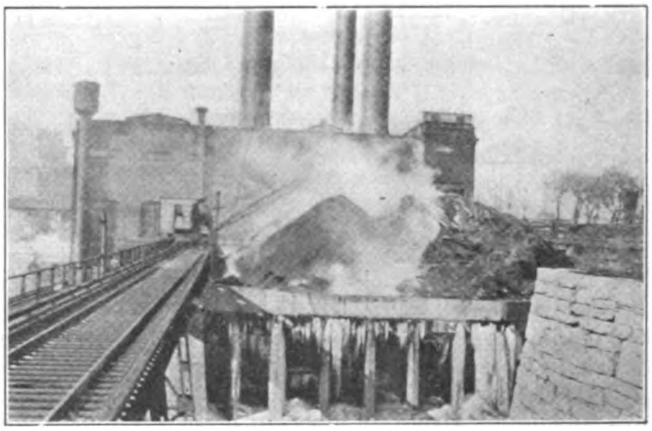
Reserve Supply for the Railway Power Plant Is Stored in Two 14,000-Ton Reinforced Concrete Bins to Eliminate Fires from Spontaneous Combustion

THE storage of coal under water in concrete pits constructed for that purpose to eliminate fires from spontaneous combustion has been resorted to by a number of public utility companies and other large coal users. Up to several years ago the Twin City Rapid Transit Company, Minneapolis, Minn., was caused considerable trouble and much expense because of fires that broke out from spontaneous combustion in its huge piles of stored coal. Although most of the coal never reached the actual ignition point, there was a marked deterioration in its calorific value because of the heating. These difficulties have been largely remedied by the construction of two concrete storage bins.

The power plant itself is so located on the lower river bank, only a few feet above the level of the Mississippi, that it is hemmed in on two sides by the steep embankments which rise to the upper ground level. When ordinary storage methods were followed space limitations meant that often the coal had to be piled higher than was known to be safe.

One of the 14,000-ton bins was constructed in a small space on the east side of the power plant. The reinforced-concrete structure, which is completely above the ground, is basin-shaped and is supported at the outer edge by vertical concrete columns. The bin is divided into four compartments, each of which can be flooded and filled separately. The loaded coal cars are shunted onto a trestle, level with the top of the bin, and by means of a locomotive crane the coal is unloaded and dumped into the bins, which are previously filled with water. The coal is removed with this same crane and dumped into a hopper at the junction of the four partition walls. From the bottom of the hopper a belt conveyor carries the fuel to bucket conveyors, which elevate it to the bunkers.

The construction of the storage bunker on the north side of the plant is quite different, for its shape and size were determined by the space available between the wall of the power station and the embankment. The far side of the bin, which has a 45-deg. slope, is built like a mat on the excavated earth of the embankment while the bottom rests on a strata of rock. Since the building wall, constructed of stone and mortar and designed to support only a compression load, had to be utilized as one side of the bin, further reinforcement against the lateral forces had to be provided. This was done by supporting the wall at eight points with buttresses which extended through the wall and onto the boiler room floor for a distance of 7 ft. at their base. The upper end of each buttress is secured to the wall of the bin with tie rods, while the actual weight of the wall is transferred to the building wall by means of concrete dowels. This bin has an average depth of about 30 ft. and is not subdivided.



Reinforced-Concrete Bin for Storing Coal under Water at East End of Twin City Power Plant

The loaded cars can be dumped directly in the north bin from a track which extends along the station wall. It is an extension of the spur which goes over the main receiving hopper and into which the coal to be conveyed directly to the bunkers is unloaded. The coal is reclaimed by the locomotive crane, which dumps it into the regular receiving hopper. Since the range of the crane is limited, sometimes it must make several operations to transfer the coal up to the hopper located at the northeast corner of the building.

The accompanying view, which shows considerable steaming, was taken during zero weather, when the evidence of such a condition is most pronounced. At that time there was probably as much coal stored above the water line as below owing to the large reserve that had been accumulated. This, of course, is an abnormal condition and has the same effect as though the coal were piled on the ground at a height equal to its depth above the water level.

Switch Easements and Frog Standardization

Some Observations Regarding the Difficulty of Specifying Special Trackwork Curves That Will Suit all Conditions

By S. Striezheff
Department of Way and Structures
Brooklyn Rapid Transit System

The fact that the committee on way matters of the American Electric Railway Engineering Association, at its May meeting, took no action with respect to standardization of branch-off frogs spurred the writer to set down a few pertinent observations on frog standardization in particular and of A. E. R. E. A. switch easements in general.

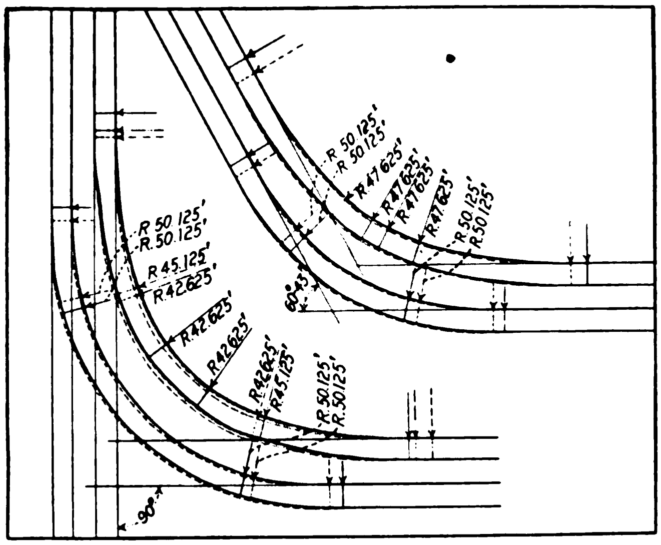
While the idea of possible standardization of frogs is in itself a very good one, the method suggested in Appendix A of the A. E. R. E. A. 1921 report, i.e., the insertion of a "closing" radius between easement and inner radius so as to take care of different gages and devilstrip widths, is inconsistent. It does away entirely with uniform curves, rendering meaningless Appendix C of the same report, as well as the 1920 report with regard to Type A easements. Study of Appendix A demonstrated to the writer the disadvantages of this method of frog standardization and rendered him skeptical as to the advantages stated on page 76 of the report mentioned.

That the alleged saving of 50 per cent in the total number of frogs cannot be realized is evident when we consider the relative amounts of special trackwork purchased during a given time by different street railway companies. For example, take on one hand a large system having a standard gage and practically uniform track centers, and on the other the small units of odd gage and varying track centers running through the boroughs of Squeedonk and Toonerville. In general, why should a large system such as the Brooklyn Rapid Transit, for instance, adapt itself to the physical and pecuniary limitations of the Gopher Prairie single-track transportation units?

The report itself contains the following statement: "In the matter of interchangeability of frogs on any one street railway system having only one distance between track centers, the proposed standardization scheme offers little advantage."

So much for standardization. As to the A. E. R. E. A. easements in general, they present no improvement on easements or spirals in use. The outline of a 200-ft.-radius A. E. R. E. A. Type A switch easement is practically the same as that of Lorain switch spiral No. 3. Even if there were some slight difference it would hardly be worth the effort to secure it. As a way engineer recently said to the writer: "What is the use of all this theorizing in surface road special work? Thirty days after installation all your theory is wiped out!" A prominent American engineer, after his return from service overseas, said that in France they were continually installing curves of plain radius and that the cars going over them would after a while work out a spiral for themselves at each end of curve.

As far as Brooklyn is concerned Appendix C of the 1921 report could just as well never have been included, as it simply does not and cannot suit local conditions. The main feature of this appendix is the insertion of an intervening long radius between the 200-ft. switch radius and the spiral easement (for greater car clearance), thus increasing the ex-secant and bringing the curve almost onto the sidewalk. This limitation was recognized by the proponents of the appendix and they suggested for Brooklyn the 200-ft. switch easements A, and furnished a set of possible double-track branch-off curves. Unfortunately this was a hybrid solution of the problem, following neither the 1921 Appendix C nor the 1920 A easements, on account of the insertion of the "closing" radius for that much coveted but as yet unrealized frog standardization. Further consideration has caused these suggested curves to be laid aside, at least for the present.



TRACK CURVES OF DIFFERENT DESIGN DRAWN FOR COMPARISON OF A. E. R. E. A. EASEMENT SPIRALS AND THOSE IN GENERAL USE

In both sets of curves A. E. R. E. A. easements at ends of curves are indicated by full lines (as well as the joining central radius curves). Dash lines represent curves of same central radius with Lorain spiral easements at ends.

Dotted line curve in 90-deg. intersection has central radius 2.5 ft. longer than full line curve in same location but approximately same ex-secant due to Lorain spiral easements at ends. Thus, dotted inner curve with dash-line outer curve presents same situation as full line inner and outer curves, both for car clearance and area occupier.

The accompanying diagram shows the lack of advantages in the A. E. R. E. A. easements and also brings out some of their disadvantages. For instance, in the 90-deg. branch-off, the Lorain spiral No. 3, with 150-ft. radius switch, allows for a longer central radius without practically any increase of ex-secant, thus assuring a longer life to the curve. The entire branch-off, shown in full lines, with 200-ft. radius A. E. R. E. A. switch easements A in the inner curve and 100-ft. radius easements in the outer curve required about 13 ft. of special trackwork more than the inner curve (shown by the dotted line) of longer central radius and the outer curve (shown by the dash line), with Lorain spirals Nos. 3 and 2 respectively. Yet these last two involve the same conditions as far as car clearance and area occupied are concerned.

In conclusion, while the writer sees no advantage in either the Type A switch easement of the 1920 report or in those of Appendix C of the 1921 report, he recognizes the difficulty of the subject of possible frog standardization and admits the great desirability of such standardization. He fails, however, to see how the method suggested in Appendix A can improve matters to any extent.

What's New from the Manufacturers

Transformer Load Indicator

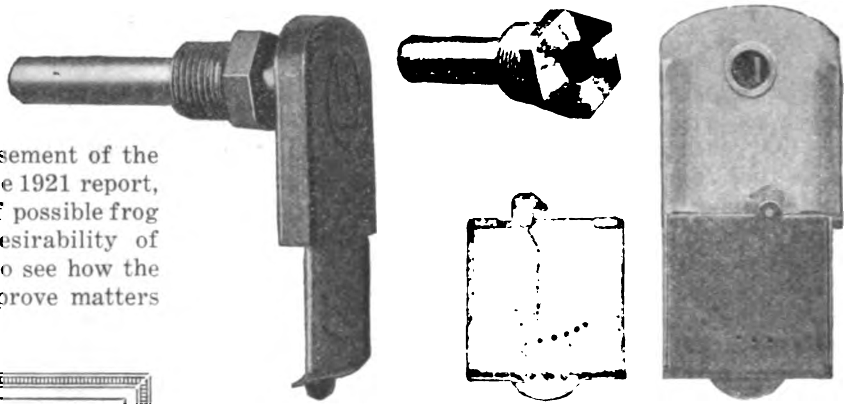
A TRANSFORMER load indicator is being manufactured by the Westinghouse Electric & Manufacturing Company. The indicator is made for mounting in place of the drain plug or, preferably, in the side of the tank wall a few inches below the oil level in a distribution transformer for the purpose of indicating whether any predetermined temperature of the transformer has been reached or exceeded. When the predetermined temperature has been reached, a yellow semaphore, or flag, drops into view to indicate the fact. Since the flag is of a distinctive color, and has an area of about 2½ sq.in., it can be readily seen from the street by a watchman.

The most important use for this device is to indicate when a transformer is overloaded, but it can also be utilized to determine whether transformers operating in a bank or in parallel are properly dividing the load. Underloading can also be detected by setting the indicator to trip at a low temperature, failure to trip at this low temperature being an indication that the transformer is underloaded.

The load indicator consists in general of two parts—the indicating mechanism and the plug. The plug portion replaces the regular transformer drain plug or the special plug now being provided in Westinghouse distribution transformers a few inches below the oil level, and it can be inserted in the transformer tank either in the storeroom or on the line. The pipe is a tube closed at the inner end and enlarged to a standard pipe thread with a hexagonal nut at the outer end. The tube, when in position, is surrounded by the transformer oil.

The indicating mechanism consists of a base plate, tube, bimetallic strip, flag, adjusting rig and cover. The tube fits the inside of the plug and has a threaded piece at the end which engages the nut in the end of the plug. By means of this threaded piece, the indicating mechanism can be inserted in the plug with a turn or two after the transformer is hung and can then assume a vertical position without danger of falling out.

The bimetallic strip is set in the end of the tube while the free end, projecting beyond the end of the base plate, latches the flag in position. The flag is held until, through an increase in temperature, the bimetallic strip bends enough to unlatch it; then it drops by gravity. The top of the flag is bent over and, after dropping, engages the bottom of the base plate, which is bent upward. The flag is reset by simply pushing it back in place.



At Left, Transformer Load Indicator. At Right, Dissembled View of Transformer Load Indicator Showing Yellow Flag in Tripped Position and Method of Obtaining Different Trip Settings

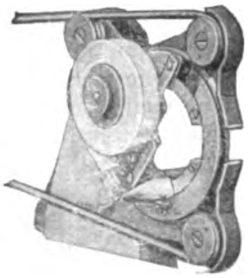
The indicator can be set to trip the semaphore at any predetermined temperature within the range of adjustment by setting the trigger.

The indicator responds to the temperature of the oil in which the plug is immersed, and since the object is to have the signal trip when the hottest part of the winding has reached a temperature of 105 deg. C., it is necessary, in setting the pointer, to allow for the difference between the temperature of the hottest part of the winding and the temperature of the oil at the top or bottom of the tank where the indicator is placed.

For average operating conditions, it will generally be found satisfactory to set the indicator to trip when the oil at the top of the tank reaches a temperature of 80 deg. C. or when that at the bottom of the tank reaches a temperature of 70 deg. C. In setting the indicator, however, consideration should be given to the individual temperature characteristics of the transformer on which the indicator is mounted.

New Armature Coil Taping Machine

THE P. E. Chapman Electrical Works, St. Louis, Mo., has brought out a kickless self-feed armature coil taping machine. It is claimed that this machine takes the "kick" or pull of the tape off the operator, so as to make operation easy. The operator, however, guides the coil and operates the machine in a similar manner to a plain taping machine. The machine has no gears, cams, belts and requires no setting up for a job. The self-feed allows the operator to increase or decrease the lap at will and while running. The machine is claimed to be economical in the quantity of tape used and will make a smooth and neat coil of uniform size.



Armature Coil Taping Machine

Securing the Maximum Benefit from Energy-Saving Devices*

The Author Has Brought Together the Experiences of Twenty Railways Using the Three Types of Devices for Measuring Energy and Power-on and Coasting Times—A Summary of Follow-Up Methods and Figures on Instrument Maintenance Are Presented

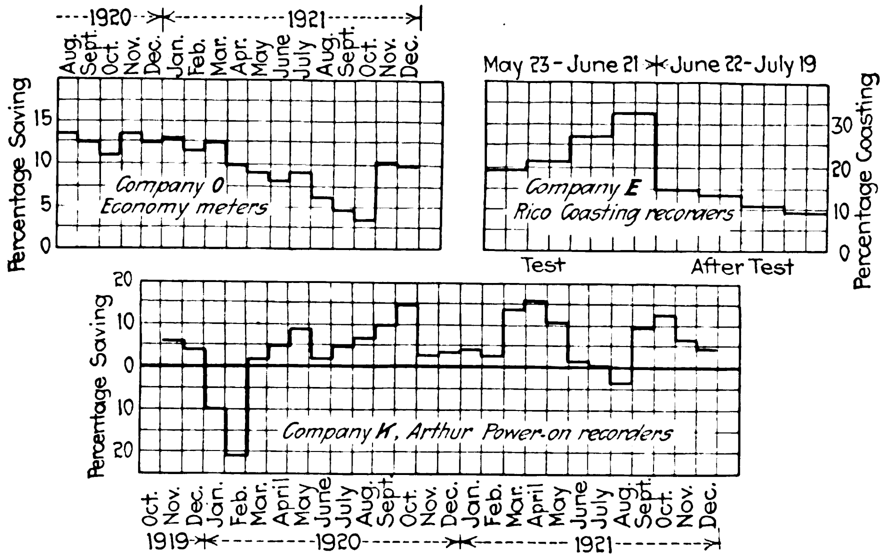
By Frank H. Miller
Vice-President Louisville (Ky.) Railway

THERE are now on the market three power-saving devices that have reached a successful and acceptable state of perfection. These are the Rico coasting recorder, the Arthur power-time recorder and the Economy kilowatt-hour meter. The basic principle and method of operation of each of these devices are well known to all electric railway operators. The number of properties using energy-checking devices of one form or another is sufficient so that considerable data are available on the savings their use has made possible. It is the magnitude and nature of these savings in which we are particularly interested.

This paper is based on information obtained from twenty railways using energy-saving devices. Six of these have installed the Rico coasting recorder, seven the Arthur power-on recorder and seven the Economy meter. All these companies report uniformly that these devices are effective in saving energy, and generally agree that the saving up to a certain point is almost proportional to the amount of time devoted to the instruction and follow-up of the operators of cars equipped with such devices.

A résumé of the outstanding advantages as received in answer to the twenty questionnaires is tabulated in Table I. This table shows the number of meters installed on each property, the date the instruments were placed in service, the advantages of the devices according to the experience of each operating manager, the number of clerical employees required per one hundred devices, the methods used to arouse and stimulate the interest of the platform men and the annual maintenance cost. The great interest of operating men in the subject of power saving is indicated by the complete and valuable information furnished. Many interesting practices were described in the replies and almost every one mentioned other advantages that had accrued from the use of power checking devices besides the main one of energy saving.

For instance Company "A" states that men with a high coasting percentage seldom have an accident. The report of Company "C" shows that both preliminary tests and later experience indicate that a 1 per cent increase in coasting is equivalent to a saving of 1 per cent in energy. Prior to the installation of coasting clocks secret checks of motormen's performance revealed an approximate coasting average of 20 per cent, and following the use of clocks as high as 30 per cent was secured. In regard to the interest taken by the men in energy saving, Company "D" estimates that 15 to 20 per cent of the motormen, especially the "high coasters," actually check their own coasting time daily. The operator of Company "E" made the statement that any device which the motorman knows is accurately checking the energy consumption will be the means of reducing it until a reasonably low value has been reached.



GRAPHS FROM THREE PROPERTIES EACH USING A DIFFERENT ENERGY SAVING DEVICE

The decreased saving of Company "O" during the last half of 1921 was probably due to the increase in passengers per car-mile. Company "K" stated that the variation in the amount of saving was undoubtedly caused by the difference in supervision.

A feature of the coasting recorder is brought out in the statement of Company "F":

> The principal advantage of the coasting recorder as a power saver is that it emphasizes that phase of operation, i.e., coasting, which is one means of saving power. It is, however, subject to the objection that the results have no absolute relation to the kilowatt-hour saving. In one way this is an advantage because it is unnecessary to take into account the characteristics of the motor equipment or of the loading in order to obtain a measure of what has been done by the motormen to save power.

A user of the power-on type of device, Company "G," emphasizes the simplicity of the record keeping system as a distinct advantage:

> We regard any type of power saving device as merely a method of educating motormen. No device, in our opinion, is of any use unless it is carefully followed up. The Arthur power-on recorder permits this follow-up and educational work to be done in a simple and effective manner. Perhaps its most marked advantage is that it permits a simple system of record keeping, since it is not necessary to classify different types of car equipment to any appreciable degree.

In regard to offering prizes this company adds:

> We are strong believers in the need of keeping up the interest of the employees by some sort of prize or bonus system. In the beginning we worked out a scheme which experience has shown to be quite satisfactory. We set a standard on each line for the motormen to work toward. All men who do better than the standard receive a small prize. The man who heads the list on each line receives $5 at the end of each three-month period. The man who takes second place receives $3, and a $2 bonus is given to all others who have done better than the standard. We find it much better to offer a large number of small prizes rather than a few relatively large ones, as more men are kept interested.

Company "H" was pleasantly surprised with the effect of power saving on the life of equipment:

> When we first considered putting on power-time recorders our mechanical department was under the impression that in the efforts to save power the car equipment would suffer. It was gratifying to receive recently a report from our superintendent of rolling-stock and shops entirely justifying our installing these recorders and in which was made the rather broad statement that the improved way in which our rolling-stock was being handled was prolonging the life of car equipment considerably.
>
> We have effected a saving of roughly between 12 and 14 per cent, principally during the last year and a half when working conditions have been improved and we have been able to carry on our power saving campaign more intelligently.

The prize system for encouraging the maximum power saving is employed quite extensively. Company "I" states that a standard "power-on period per hour" for each line is set and all operators coming within this limit are given a premium of $2 a month. Companies "J" and "K" keep up the interest of their platform men by a scheme similar to that of Company "G" except that the prizes are awarded on a six-day week instead of a three-month basis and are of one-half the amount. The motormen of Company "M" are grouped by lines and a weekly list posted in each depot showing their names arranged in the order of their "power-on minutes per month" record. The supervisor of power saving and his outside man are in constant touch with the supervisory force and the

TABLE I—INFORMATION FROM VARIOUS ELECTRIC RAILWAYS REGARDING CURRENT-SAVING DEVICES

Company	Type of Device	Number of Instruments	Time of Installation	Advantages of Device	Number of Clerical Employees per 100 Devices	Methods Used to Keep Up Interest	Annual Maintenance per Instrument
A	Rico	1,350	1915-1921	Makes a man "think." Reduces accidents. Checks schedule, equipment and men	1.5	Four instructors who devote all their time to this work	Not stated
B	Rico	369	1917	Unit (minute) used is familiar	1.286	Bulletins, six coasting instructors, individual motormen's records. "Follow up" by official interest	$1.80 first year, $1.76 second year, $6.30 third year, $7.60 fourth year
C	Rico	600	1916	Checks motorman on proper use of power and brakes	.5	Semi-monthly bulletins	$3.40
D	Rico	600	1917-1918	Checks individual operating efficiency of each motorman	1.25	Cash prizes	$6.66. Average of four years $1.50-$2 higher than normal due to strikes of trainmen
E	Rico	348	1913	Moral effect on motorman	2.0	Compliment motormen. Bulletins and published records issued	$10.40 in 1921
F	Rico	201	1911	Emphasizes coasting	1.3	Monthly bulletins giving percentages of various men	$25.00
G	Arthur	1,466	1917-1918	Mechanically and electrically simple. Costs less. Checks faulty brakes and equipment. Records simple	.204	Individual record in pay envelope. Bulletins posted. Number of small cash prizes	$1.80
H	Arthur	1,100	1919-1920	Reduces power consumption. Prolongs equipment life. Promotes more safe operation	.5	Monthly bulletins	$0.50
I	Arthur	34	1920	Records time in minutes for power on. Moral effect on car operator	.3	Monthly prize of $2 to all operators who come within a certain standard	$0.50
J	Arthur	388	1920	Simplicity, low maintenance cost, ease and economy of record keeping	.6	Power-saving inspector. Distribution of cash prizes every six weeks	$0.08 first year
K	Arthur	282	1919-1921	Low first cost. Low cost of maintenance and record keeping	1.0	Cash prizes, and constant supervision by inspectors and foremen	$0.15
L	Arthur	170	1915-1920	Power saving of 10 per cent	.85	Cash prizes and constant instruction	Not stated
M	Arthur	1,400	1920-1922	Permanently accurate, low first cost, reliable, rugged and simple. Units used familiar to trainmen	.57	Weekly bulletins. Close supervision, and fostering of competition and rivalry among men	$2.04
N	Economy Meters	330	1919	Provides means for comparing men, and different types of equipment on the same or different lines	...	Bulletins and instruction to less efficient	$1.02 in 1920. $2.68 in 1921
O	Economy Meters	450	1919-1922	Comparison of men. Checks up equipment	1.0	Semi-monthly bulletins, and "follow-up" instruction	Not stated
P	Economy Meters	106	1920	Operators can observe power consumption, meters are simple, sturdy and reliable. Inspection dials are valuable for car inspection	1.0	Bulletins. Short competitive efforts. Constant supervision and instruction	$1.20
Q	Economy Meters	109	1920	Positive measure of power consumption	1.0	Supervision by power-saving inspector	$2.70
R	Economy Meters	539	1919-1921	Measure saving in units desired. Measures power consumption at car. Inspection dials. Rugged and simple	1.0	Competitive spirit. Bulletins. Constant supervision and interest of officials	$1.44
S	Economy Meters	120	1915-1920	Measures energy consumed at the car	1.0	Weekly bulletins. Constant supervision	$2.90
T	Economy Meters	309	1922	Measures power consumed at the car. Meters simple, sturdy, and reliable. Inspection dials valuable for car inspection	1.0	Semi-monthly bulletins. Supervision by inspector	Installed in 1922

motormen, and keep the matter of power saving a live issue by fostering a desire among the motormen to head the list. The matter of some form of bonus for a high standing is under consideration.

When we come to the reports of railways using Economy meters we find that there is almost no end to the constructive interpretations that can be placed on the actual kilowatt-hour consumption of a car as measured by this type of instrument. Company "N" remarks that the meters are of considerable value in providing comparisons of power consumption of different types of cars or of the same car on different lines. In regard to conducting the power saving phase of car operation this company adds:

> Occasional bulletins are posted and the interest of the men is further kept up by sending out lists showing comparative standings. These lists do not show the names of the men but simply the records with a check mark opposite the record of the man receiving it. Those using excessive power are instructed further in the proper method of handling equipment, and those who constantly remain near the top of the list are sent letters of commendation by the general superintendent.

Company "O" finds the principal advantages of Economy meters as follows:

> They make it possible to publish a fair relative ranking of motormen for each class of run on each route. The relative ranking, together with the follow-up instruction after the novelty wears off, stimulates the motormen to maintain a standard of economical operation.
>
> The meter detects at once any mechanical defects which increase power consumption, such as tight brakes and defective motor wiring.

TABLE II—PER CENT POWER SAVING OF COMPANY "T" COMPARED WITH BLIND PERIOD

			Divisions					
			I	II	III	IV	V	VI
1922		Number of Meters Installed	17	27	23	21	32	69
Week Ending		Blind Period—Weeks	2	1	1	1	1	2
January	30		7.44					
February	6		11.98					
	13		12.40					
	20		12.80					
	27		11.57					
March	6		11.98					
	13		11.98					
	20		13.22					
	27		12.80					
April	3		11.57					
	10		10.33					
	17		7.02					
	24		9.90	12.90				
May	1		9.10	7.60	10.10			
	8		10.70	9.12	6.36	11.55		
	15		11.60	9.87	8.60	10.13	5.75	
	22		10.70	11.40	10.50	14.40	5.14	
	29		11.57	9.50	10.80	15.60	5.43	
June	5		9.90	9.50	13.85	15.90	8.75	8.34
	12		8.68	9.12	12.35	15.60	9.37	8.04
	19		9.50	8.75	11.20	15.3	6.35	8.34

Several additional points are brought out by the statement of Company "P":

> The meters are simple, sturdy and reliable. Operators have faith in their accuracy. They require but little attention and that from an ordinary electrician. Much valuable data can be compiled from the meter readings. By the use of the inspection dials the shop men can see at a glance whether or not the car is due for inspection.

This company keeps up the interest of the men by comparative reports displayed in the train rooms and with inspirational, informative and educational matter printed in the employees' magazine. Occasional special competitive efforts of short duration help maintain discipline. It is their idea to make power saving an incidental but steady part of each man's work.

Among other advantages, the operator of Company "R" mentions that of getting a measurement of energy at a point not otherwise obtainable so that it is possible to segregate definitely the distribution losses. This company also encourages the motormen to report promptly those faults of the car equipment which would increase energy consumption. The manager of the property takes an active personal interest in the correction of these defects and also rides frequently with the motormen to discuss the ways and means of saving power.

The experience of Company "T" with Economy meters is shown in Table II. The meters were first placed on one division for a trial period of two months. After the initial test meters were ordered for the other divisions of the company and were installed at intervals of one or two weeks as indicated in the tabulation. A rather marked difference in the saving from week to week will be noticed. In analyzing these variations it was found that fluctuations in the number of passengers carried materially affected the percentage of energy saving.

Relation of Car Ventilation to Passenger Comfort*

Volume of Air Required for Desired Refreshing Effect Greatly Exceeds That Necessary to Supply Chemical Needs—Exhaust Ventilators with Arch-Type Roof Entirely Practical, Utilizing Leakage as Fresh Air Supply

By W. McK. White

President White Manufacturing Company, Goshen, Ind.

PROPER car ventilation is a vital necessity to every electric railway as one of the factors for securing public good will and increased traffic. To be sure, it is a sanitary problem affecting public health. The era of considering the pleasure and comfort of passengers is at hand. An electric railway cannot sell its service to the best advantage by subjecting its customers to unpleasant surroundings. Executive and transportation officials are constantly reminded of ventilation by popular sentiment, and those in charge of equipment have accorded the subject some investigation. I think, however, that far too many cars are ventilated in a haphazard manner due to many conflicting theories causing car designers and operators as a last resource to take a chance on some simple means, which may produce ventilation, though actually it may be inadequate.

Scientific study has given some data on the proper content of air in steam railroad coaches, on the frequency with which the air must be changed and on the relation between heating and fresh air supply. I am quoting frequently herein from bulletins published by Dr. Thomas R. Crowder, who conducted a number of extensive tests for the Pullman Company. The further these investigations progressed, the more pronounced became his opinion that the question is one of psychology and physics rather than one of chemistry.

The first recorded attempts to study air in railroad cars were made in 1875 by Wolfhugel and Lang. The next inquiries were instituted in 1878 by the Prussian Minister of War to learn the best methods for ventilating hospital cars. In about 1893 the Massachusetts Board of Railway Commissioners had tests made in passenger coaches and at the same time the Pennsylvania Railroad opened the subject. In 1894 the Master Car Builders' Association made an extended report and published analyses of air from sleeping cars, chair cars and suburban coaches. In 1904, Dudley of the Pennsylvania System issued a report on a number of experiments in analyzing air from coaches ventilated by the excellent plan which he devised.

A Problem of Circulation, Not of Air Purity

The results of all these studies show that steam railroad cars with standard exhaust ventilators average a lower carbon-dioxide content than restaurants, offices and stores, and that the main problem is one of circulation, not of air purity. It is not my purpose to include the mathematical data recorded in these tests because they all prove that the necessity for ventilation does not arise from a poisoning of the air by products of respiration. It is rare for the carbon dioxide so produced to contaminate the air of any room, even with the poorest ventilation, to the extent of more than fifty parts in ten thousand, or one-half of one per cent. That amount is entirely harmless. The limit of allowable carbon-dioxide content is variously placed at from ten to fourteen parts in ten thousand and is that degree at which the sense of smell gives indication of closeness to one entering the room. The averages of steam railroad cars with adequate exhaust ventilators were shown to be within this limit, but the average of electric railway cars examined exceeded this ratio.

An interesting series of tests conducted by Dr. Crowder showed the following contents of carbon-dioxide in parts per 10,000:

Sleeping car, lower berths	6.96
Stores	8.80
Steam railroad day coaches	9.38
Elevated railway coaches	13.90
Offices	13.91
Suburban railway cars	14.30
City street cars	15.10
Restaurants	16.10

It is a comparatively simple matter to supply enough sufficiently oxygenated air to any railway car. In fact, the more usual difficulty is encountered in letting too much in. The really important problem is to govern and regulate the air movement within the car. Relatively small amounts of fresh air will supply the chemical needs of the body whereas large amounts may be required to satisfy the physical demands.

To the average person fresh air is that which cools the body. Its so-called freshness depends upon its ability to remove body heat and is not affected by richness in oxygen or absence of poisonous gases. Partially vitiated or devitalized air will not be criticised by passengers if it is stirred up. Of course this statement is not to be construed as an excuse for poor ventilation but is in explanation of the fact that surface absorption is most important in its effect on bodily comfort. Moreover, the simple stirring up of air on a line patronized by "unwashed" passengers is not sufficient to eliminate objectionable odors.

An average adult produces enough heat in about an hour to raise the temperature of 1,000 cu.ft. of air 15 to 20 deg. F. and this heat must be absorbed to keep the person cool and comfortable. If the air is still the effect is depressing. When people crowd together in restricted space they soon overheat the air. Either fresh air must be supplied or the air must be put into motion. It is evident that air movement in a car is more important than its purity and its temperature is more significant than its carbon-dioxide content. Proper renewal assures healthfulness, but this renewal of the interior air must not cause chilling drafts nor "short circuits" in certain parts and the methods for securing this circulation must prevent entrance of dirt, side drafts, rain or snow.

Use of Monitor Roof Proves Need for Ventilation

The use of the monitor roof is an admission of the need for ventilation. It was the first attempt and yet many railways, both steam and electric, retain this primitive means for obtaining good air by the use of deck sash. The deck sash should rapidly be discarded as a car ventilator. Sometimes the open sash permits large volumes of air to enter, often very little. Sometimes it acts as an outlet but offers no as-

---

*Abstract of paper presented before the Central Electric Railway Association, June 25-30, on board *S.S. South American*.

sistance toward removing warmed air from below. When acting as an intake the large opening permits undesirable downward drafts and in stormy weather, when ventilation is most needed, the deck sash must be closed. Thus no dependence can be placed on such ventilation and no railway with such a handicap can sell satisfaction to passengers.

On the other hand, the monitor roof can be readily adapted to give highly efficient ventilation by the installation of a number of exhaust ventilators. This can be done at a moderate expense because standard size ventilators can be obtained and mounted on wood or metal panels to fit in the deck opening. They may be applied to the outside and the sash used to open or close the ventilator aperture. Several well-known electric railways have thus modernized their equipment in this respect. One of these is the Indiana Public Service Corporation. Arthur W. Redderson, superintendent of equipment of that company, states that it was done at a cost of only $10 per car in addition to the cost of the ten ventilators. The satisfactory result is best shown by the popularity of these cars.

There are many railway men who prefer monitor roof cars either because of personal preference or to harmonize with railway standard design. On new equipment the exhaust ventilators can be used advantageously and there are several successful ventilators for such application. No superintendent of equipment need consider the selection of any one of them a life and death matter.

ARCH-ROOF CONSTRUCTION DEPENDENT ON EXHAUST VENTILATORS

Effective ventilators have made the arch-roof car possible. In other words, arch-roof cars would be exceedingly unsatisfactory were it not for successful car ventilators. It takes no argument to prove this because a short ride in an arch-roof car with ventilators closed soon gives adequate demonstration. The importance of ventilating an arch-roof car requires that an efficient eductive car ventilator should be applied. But let me caution you that a hole in the roof, with protection against rain and no assurance of exhaust action, is not sufficient.

Prior to the perfection of storm proof ventilators it was always thought necessary to install regulators and this is still a general custom. I believe, however, that a regulator or register is not always necessary or advisable. Careful scrutiny shows that usually these registers are closed and thus the good provisions for ventilation are made useless. Control of ventilation is thus transferred to whims of conductors and passengers.

If a car is equipped with sufficient ventilators for average or nearly maximum traffic and heating apparatus of properly related capacity is installed, it is far better to omit controlling mechanism. There are several exhaust ventilators which will not admit rain or aid winds and consequently do not have to be closed in stormy weather. Even in cold climates this plan is followed. The Milwaukee Electric Railway & Light Company, Milwaukee, Wis., was one of the first properties to omit registers and that city has exceedingly cold winters. The Chicago Surface Lines was one of the early users of exhaust ventilators without control.

I have frequently used the term "exhaust ventilators" and may explain this in approaching the matter of intakes, by stating my conviction that exhaust ventilators are the most satisfactory. Due to car construction and the physical action of warmed air in rising, it is necessary to withdraw this air in proximity to the roof. I further believe that you cannot take air into and out of a car at the same place without causing short circuits of air currents and with no assurance that the incoming air will have time to drop into the breathing zone before being withdrawn. That such short circuiting does take place was shown in tests, where by actual measure some 80,000 cu.ft. of air per hour was leaving a car through the exhaust, although carbon dioxide computations showed only 40,000 cu.ft. being supplied to the breathing zone.

Undoubtedly the ideal plan for car ventilation embodies a properly arranged system of intakes, preferably with distributing ducts. Frequently car construction complicates such a layout. For many years those seeking adequate ventilation depended upon leakage for supply of outside air. We now have metal sash, weather strips, storm windows and tight construction to decrease leakage, but steam railroad tests indicate that in the tightest cars the crevices still provide adequate intake.

Dr. Crowder measured 30,000 cu.ft. per hour passing out through the ventilator duct of a small stateroom with door and windows tightly closed so that the air must have found its entrance through crevices. Pettenkofer showed that when all visible chinks in a room were closed, the rate of ventilation was decreased only 28 per cent as compared with the rate when doors were closed in an ordinary way. There is no difficulty with an open fireplace draft when a room is closed, though each pound of fuel consumed causes some 2,600 cu.ft. of air to pass up the flue. Few inclosures are so fully provided with crevices as a railway car and subjected to such high wind velocities and pressure. With an average of some 500 lineal feet of crevices only 0.01 in. wide, over 20,000 cu.ft. of air could enter in an hour.

If this leakage is not too great it is a satisfactory intake as the air quickly mixes with warm currents from the heaters. The doors of cars in city service are opened frequently but on interurban cars either leakage or designed intakes must balance the action of the ventilators. Those heating systems which circulate warmed air meet this requirement but are usually installed on city cars only, perhaps because they supply heated fresh air on one side only.

I do not know of any instance of air intakes with distributing ducts of both sides of an interurban car using hot water heat. The Pennsylvania Railroad has used a system similar to this for several years on all-steel coaches, but these coaches can be supplied with large quantities of steam, whereas on an interurban car the water has to circulate in limited pipeage. It must not be cooled near the entrance to the passenger compartment so much as to withdraw its heat and leave only cold water in the pipes on one side of the car.

AIR LEAKAGE SUFFICIENT ON INTERURBANS

Consequently the air intake problem on interurban cars is still awaiting solution. My feeling is that leakage must take care of these cars, if not overdone, and will be adequate because there is less crowding on them and they require a higher degree of maintained temperature. It would be inadvisable to establish the practice followed on steam coaches and sleeping cars of dropping the end-door windows, because the draft would be unheated and too direct on those sitting in the rear. Furthermore, whenever the car is stopped the area of low pressure in the rear of the moving car, which tends to withdraw air from the body, is equalized and causes a strong inrush of air from the rear toward the front.

The requirements of a good ventilator are efficiency, protection against storm and side winds and ease of application. There are a number of accepted types, usually either round, box, honeycomb or ejector, and their producers have been diligent in experimentation in the laboratory and in service to increase their efficiency. They have given deep study and have spent large sums in endeavoring to solve the question of proper ventilation. In their behalf I must say that this work has sometimes been rendered difficult due to deep-seated opinions held by operating men who would defend their individual ideas rather than accept the experience of ventilating engineers delving into this problem.

I feel that little hesitancy need be had in accepting many of the well-known car ventilators on the market. They are designed so that the movement of the car produces a partial vacuum in the passage to the car body and considerable volumes of air can be withdrawn. One series of tests showed the following capacities in cubic feet per hour per ventilator:

At 5 miles per hour	5,700 cu.ft.
10 miles per hour	10,900 cu.ft.
20 miles per hour	20,200 cu.ft.
30 miles per hour	31,700 cu.ft.
40 miles per hour	41,300 cu.ft.
50 miles per hour	52,700 cu.ft.
60 miles per hour	64,200 cu.ft.

Another type showed 4,600 cu.ft. per hour at 5 m.p.h.; 16,900 at 10 m.p.h.;

34,300 at 20 m.p.h. and 54,300 at 35 m.p.h. Another type suitable for steam or interurban coaches registered as high as 99,000 cu.ft. per hour at 60 m.p.h. Velocity tests showed that air was withdrawn at a speed very nearly half that of the car. These figures were laboratory tests and in service experiments it was found that a reduction of 30 per cent would accurately represent their capacities. Much computing has been done on the amount of air which should be moved through a car and the simplest figure mentioned is 2,000 cu.ft. of air per person per hour. This happens to coincide with the amount necessary to carry off the hourly production of heat generated by the average adult and will maintain the requisite chemical purity.

The necessity for protection against the elements is apparent and the approved types of ventilators are arranged to prevent ingress of water. This is accomplished by baffle plates which hardly interfere with the air movement.

Admitting that car ventilation is desirable and required, it is evident from results obtained that present exhaust ventilators are entirely able to meet the demands of hygiene. But the success of car ventilation depends far more on supplying conditions suited to the outside of the body than to the inside of the lungs.

Gear Economies Through New Tooth Shapes*

Advantages of Long Addendum Pinions Possible Without Gear Changes with New "Wisdom Tooth"—Oversize Pinion Developed for Mating with Partially Worn Gears

By E. S. SAWTELLE
Assistant General Manager Tool Steel Gear & Pinion Company, Cincinnati, Ohio

FOR a long time stress has been laid almost exclusively on the development of quality of the steel used in railway gears, but in recent years more emphasis has been laid on tooth shape and the possibility of better gearing through design. Any proper design in tooth shape will give satisfactory service when new, but we must concern ourselves mostly with what happens when a partially worn condition is encountered. Until recently practically all railway gears had the Brown & Sharpe 14½ deg. standard tooth, excellent for smooth operation, with a full depth and therefore more wearing surface than the stub tooth, comparatively straight sided and therefore with minimum tendency for the gear and pinion to push apart. This tooth is a general standard easily interchangeable and almost universally used for industrial machinery. The chief objection to it was the fact that pinions with a small number of teeth were undercut in the flank, that is, the tooth was thin and liable to break near its root; also there was a tendency for this undercut condition to accentuate as the pinions wore. The first improvement used in the railway field was the 20 deg. stub, a tooth shorter in depth, therefore giving less breakage leverage, and having more slanting sides, therefore giving a broader base. This tooth has much strength and because of its lesser depth the pinion is strengthened somewhat against bursting, particularly where the bore is large and the pinion small. It was adopted as standard some years ago on the lines of the Interborough Rapid Transit Company, and numerous other lines with similar service.

The next development was the long and short addendum tooth, a type of gearing that for years has been used extensively in European countries, particularly Germany and Switzerland, and has been used for many years in bevel and automotive gear in America. Its application to the railway field was delayed primarily because it lacked interchangeability with old standards. This type of tooth is usually made with a 20 deg. angle which broadens the base and increases the strength. Further than this, by shifting the addendum, the pinion tooth, usually the weaker member of the train, is very decidedly strengthened and this is done without weakening the gear. By making the pinion oversize in diameter there is a gain in the amount of metal between the root of the tooth and the bore, which helps against bursting on thin pinions. This type of tooth when cut full depth shows rather thin at the top of the pinion tooth and as a remedy for this the tooth is sometimes stubbed. The stubbing process removes metal that would otherwise be worn away in service, hence has a tendency to decrease the life of the pinion, but it makes a more pleasing appearance.

To understand the signficance of the long and short addendum tooth, we will need to go slightly into theory. The involute curve is the base of practically all of our modern gearing as it represents the ideal curve of tooth contact when two gears are in mesh. Fig. 1 shows three left hand involutes generated from the same base. The section between the right and the left hand involute is a gear tooth, needing only the top trimmed off and the bottom shaped up to continue into adjacent teeth. The farther apart the involutes, the coarser the pitch and the less number of teeth in a gear of any fixed diameter. The full involute, however, is too long for practical use so a section is taken out of it for the individual gear tooth. If this section is close to the base line (Fig. 9), we have practically the straight sided tooth of very low pressure angle, used where there must be no thrust away between the gear and pinion. Coming up higher on the curve (B) we have the 1½ deg. pressure angle heretofore standard. Higher up (C) we have the 20 deg. tooth and to illustrate by an extreme case (D) we could build a gear with about a 30 deg. tooth and yet one that would have perfectly smooth action though of course with very heavy thrust and giving no service at all when considerably worn or used with bad bearings. High pressure angles therefore mean forming a tooth on the upper part of the involute curve, farther removed from the base circle. In a gear with many teeth slight changes in pressure angle are hardly measurable, but in a pinion with few teeth they are decidely noticeable.

Standard depth of tooth is purely an arbitary dimension. In Fig. 3 we have the full involute which runs to a point at the top. We first decide the pres-

---

*Abstract of paper presented before the Central Electric Railway Association, June 25-30, on board the S.S. *South American*.

sure angle we will use, this determining how high up we shall go on the involute curve to locate our pitch line. If we take a comparatively long section above and below this line, we have the full depth standard tooth. If we take a lesser section above and below, we have the stub tooth. If we take a greater section above the pitch line than we take below the pitch line, we have a long addendum pinion and when we build the gear to match it we must make it with a correspondingly short addendum.

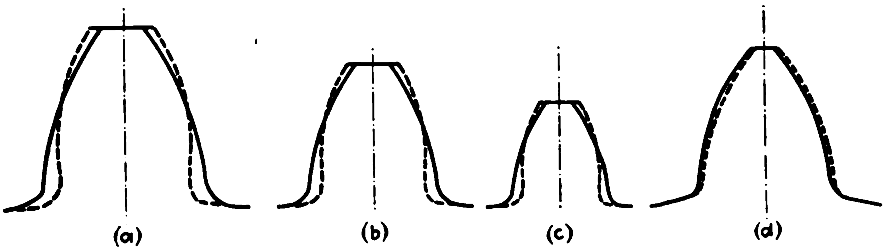

FIG. 6—CONTRAST OF WISDOM (HEAVY LINE) AND STANDARD TOOTH CONTOURS. ALL WISDOM TOOTH PINIONS HAVING ONE MORE TOOTH THAN THE STANDARD FOR THE SAME PITCH

(a) Interurban railway type; (b) city railway type; (c) safety car type; (d) identical shapes of 20-deg. long and short addendum and wisdom tooth.

In standard gearing the relative size of the tooth and slot is the same on each member. In long addendum gearing (Fig. 4) the teeth are made much longer on the pinion and project further beyond the pitch diameter On the gear the slot is deepened proportionately. Likewise on the gear mating with this pinion, the tooth projection is shortened and the slot in the pinion is correspondingly shallow. The amount of diversion in extra length and depth is optional with the manufacturer and he can build around any formula he desires. The longer the addendum on the pinion the more pointed it will be at the top of the tooth. The illustration in Fig. 4 takes an extreme lengthening of the pinion addendum to make the contrast between long addendum and standard gearing the more noticeable.

The long addendum pinion is preferable to the standard for the reason that it is a stronger pinion at the base, a thicker or "fatter" pinion at the pitch line and will in actual service permit twice as much steel being worn off the side of the tooth before rejection as is permissible with the standard 14½ deg. shape. This is illustrated in Fig. 5. When worn out, it is still a strong tooth at the base, whereas the old shape tends to wear to a weak tooth. This means that if a long addendum pinion and a standard pinion of equal quality are operating under identical service, the long addendum pinion, because of its tooth shape, will give approximately twice as much life. The gears running with these pinions will have about equal durability, in fact, only by accurate measurement can you distinguish between the short addendum and standard gear teeth form. There is no question whatever as to the desirability of the long addendum pinion for any service where gears and pinions are to be completely worn out before discarding. The only drawback is the seriousness of changing over from the old standard to the new.

The "wisdom tooth" pinion was recently brought out to overcome this difficulty* and to present to the operating man a practical opportunity for realizing all the advantages of long and short addendum gearing without going to any radical change or heavy expenditures. The "wisdom tooth" pinion (Fig. 6) is in every way a long addendum pinion and partakes of all the advantages of a long addendum pinion. It is, however, so designed and generated that it can be operated with the standard Brown & Sharpe 14½ deg. gear. Hence it can be installed without any gear change and the operator can go over to the true form of long and short addendum gearing with all its advantages by merely renewing pinions with those of the "wisdom tooth" shape. There is no dark secret about this shape; it is a pure involute generation of a standard tooth on an oversized diameter blank. Its use, however, involves one slight change, that is a slight reduction in the ratio as one tooth is dropped out of the pinion in forming the "wisdom tooth" shape. The changes in speed and acceleration caused by the different ratio are so little noticed that cars equipped with "wisdom teeth" are running on the same schedule as cars with standard pinions and even in one case are running in multiple-unit trains interchangeably. In another instance "wisdom tooth" pinions have been put on motors on one end of the car and standard pinions on the other with reports from the mechanical department that this gives thoroughly satisfactory service. Especially on pinions with a small number of teeth, such as the 13-tooth pinion standard for the safety car, the "wisdom tooth" idea gives a tremendously increased tooth strength. This has proved of great value to many users of safety cars who have been experiencing excessive breakage from the standard 13-tooth pinion. To illustrate the close similarity between the "wisdom tooth" shape and the standard long addendum pinion shape, Fig. 6 (a) shows the one superimposed on the other.

FIG. 7—CONTOURS OF OVERSIZE PINIONS HAVING A TOOTH WIDTH AT THE PITCH LINE LARGER THAN THE SPACE

"Wisdom tooth" pinions have now been sold to 44 different operating companies and their use has run to a total of 1,886 pinions. Thus far there has not been an adverse criticism. The oldest pinions have been in service longer than the life averaged from the standard pinions and still are only one-third worn out. In several cases they have completely stopped what was otherwise serious breakage trouble.

OVERSIZE PINION FOR MATING WITH WORM GEARS

A still further innovation being successfully used is the application of the "oversize" pinion of either standard, wisdom tooth, or long addendum design. This again is purely a practical problem. When your automobile cylinder and piston rings become slightly worn, you replace them with new oversize piston rings. Likewise, when a gear is badly worn, it can be mated with a pinion having thicker teeth than the normal standard. This takes out the major part of the backlash and uses up the old gear under much better operating conditions than normal. At the same time the oversize pinion, having thicker teeth at the start, has more material than can be worn off the teeth before they are reduced to the scrapping point. The teeth being thicker are stronger at the root, both when

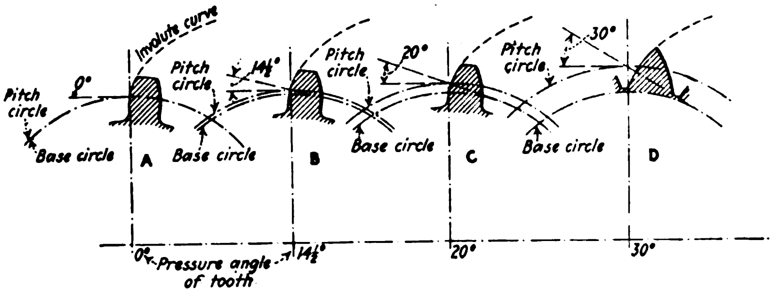

FIG. 9—TOOTH SHAPES OF THE SAME PITCH, SHOWING THE INCREASE IN THE PRESSURE ANGLE BY WORKING HIGHER ON THE INVOLUTE CURVE

new and when worn out. The advantages therefore are longer pinion wear, stronger pinions, and less backlash. The only disadvantage is the necessity of care not to mesh oversize pinions with unworn gears. This is guarded against by special markings of three grooves around the periphery of the pinion, illustrated in Fig. 9, and by using a wear gage which must go down over the gear tooth before it is worn sufficiently to take the oversize pinion. We believe the advantages more than overcome the disadvantages and where the shop organization can accommodate itself to the use of the oversize pinion, it will be found a decided saving in cost per thousand miles and its wear will greatly improve the operating conditions as regards noise, vibration, etc.

John Fritz Medal Awarded

THE board of award of the John Fritz Medal made the nineteenth award of this medal on July 8 at the United Engineering Societies' Building in New York City. The recipient was Senator Guglielmo Marconi, to whom the medal was given for his invention of wireless telegraphy. This medal was established to recognize achievements in applied sciences, and the board awarding it consists of representatives of the "founder societies," i. e., the A.S.C.E., A.I.M. & M.E., A.S.M.E. and A.I.E.E. Among previous recipients of the medal are John Fritz, Lord Kelvin, George Westinghouse, Thomas A. Edison, Elihu Thomson, Gen. George W. Goethals, Sir Robert A. Hadfield and others equally distinguished.

Technical Societies of Boston Affiliate

THE mechanical, electrical, mining and metallurgical, civil, ventilating and other engineering organizations of Boston have formed "The Affiliated Technical Societies of Boston," with headquarters at 715 Tremont Temple. In the first issue of the bulletin of the organization a list of objects and functions is given. The fundamental purpose, of course, is to co-ordinate the technical society activities, prevent duplication and promote the welfare of all engineers in the community. The various functions are to be carried out through the office of an executive secretary, under the direction of a council and the executive committee. There are at present nine member societies. One of the most useful functions promises to be a comprehensive employment service.

Well-Known Railway Men to Address Safety Council

A STRONG program has been arranged for the session of the electric railway section of the National Safety Council, which will hold its annual meeting in Detroit from Aug. 28 to Sept. 1. During the five-day session several joint meetings of the electric railway and public utilities sections will be held. A partial list of speakers before the electric railway section was given in the issue of this paper for July 8. The complete list of topics and speakers, given below, shows that all except one of the speakers are executives in the electric railway field:

A paper on "Safety as an Operating Factor," by F. R. Coates, president Community Traction Company, Toledo, Ohio; a paper on "The Human Side of Our Business," by Britton I. Budd, president Chicago Elevated Railroads and Chicago, North Shore & Milwaukee Railroad, Chicago; a paper on "The Most Efficient Manner of Conducting Safety Work," by Charles B. Scott, general manager Bureau of Safety, Chicago; a paper on "The Financial Side of Accident Prevention," by Garrett T. Seely, vice-president and general manager Pennsylvania-Ohio Electric Company, Youngstown, Ohio; and a paper by Arthur W. Brady, president Union Traction Company of Indiana, Anderson, Ind.

Safety Code Approved by A. E. S. C.

THE American Engineering Standards Committee, by letter ballot, has approved the National Electrical Safety Code of the Bureau of Standards which covers the generation, distribution and utilization of electricity for power, light and communication. The Standards Committee announces that there is now in process of formation a thoroughly representative sectional committee to consider any revisions of Part 2 of this Code, "Rules for the Installation and Maintenance of Overhead and Underground Electrical Supply and Signal Lines," which may be deemed necessary by any of the interested parties. There are also being organized three sub-committees to take up the unification of crossing specifications under the three following heads: Signal lines crossing railways; power lines crossing railways; and power lines crossing signal lines.

These committees are being organized in conformity with the action of the March 2 conference on the standardization of crossing specifications at which there were present the representatives of fourteen national, engineering, utility and industrial associations, four departments of the federal government, various state commissions of Connecticut, Iowa, Minnesota, New York, and of the telephone, telegraph and cable companies.

American Association News

Trackless Transportation

A MEETING of the American Association committee on trackless transportation was held at association headquarters on July 7. Those present were: H. B. Flowers, Baltimore, chairman; H. B. Potter, Boston, vice-chairman; W. J. Flickinger and R. E. Danforth.

The committee drew up its report in final form, which was made in three parts. The first is to cover the policies that the committee recommends as to bus operation. Then follows the report of the Transportation & Traffic Association's committee on the places where buses can be operated to advantage. Next come the vehicle designs suggested by the Engineering Association committee.

In conclusion the committee is to urge further study of the subject of trackless transportation during the ensuing year.

Revisions of the Engineering Manual Distributed

J. W. WELSH, of the American Association, has sent out, to all persons and companies entitled to receive them, sets of revised or added sections of the Engineering Manual.

To facilitate the rehabilitation of existing copies of the Manual, a set of instructions for inserting these sections has been distributed. It is hoped by this means to overcome one of the greatest difficulties in keeping the Manuals up to date, namely, the substitution of new material for old, and the addition of new sections at the proper points to permit them to be readily found by means of the index.

Inclosed with the Manual sections was a revised copper wire table, and sent out at the same time, a poster to cover an incorrect table appearing on page 452 of the 1921 Engineering Association Proceedings.

Chicago Votes to Strike

Trainmen of Surface Lines Insist that Present Contract Be Renewed for a Year

Complete tieup of local transportation facilities faces the city of Chicago. This was indicated on July 10 when the trainmen's union of the Chicago Surface Lines voted 12,149 to 37 in favor of a strike if their demand is not met for a renewal of the present contract for one year. At the same time employees of the elevated lines announced, after rejection of a similar demand by President Budd, that they would vote on July 13 to decide whether they would stand with the trainmen of the surface lines in the event of a walkout.

It was expected that International President Mahon would be called to Chicago before making the strike effective. This suggested the probability of further conferences with the officials of both companies with a view to getting together on a compromise wage cut or arbitration.

President Blair's proposal was for a wage reduction of 25 per cent for trainmen and changes in working conditions which would provide that the percentage of straight runs be reduced from 60 to 40, and the "spread" on swing runs be extended from 14 to 14½ hours and that the time-and-one-half penalty for overtime should not begin till after the ninth hour.

Conductors and motormen have been getting a maximum wage of 80 cents an hour since June 1, 1920, and when the fare was reduced from 8 to 7 cents on June 15 the management announced that expenses would have to be cut accordingly. President Blair said the revenue might be decreased as much as $9,000,000 a year, depending on what percentage of tickets would be used at the rate of three for 20 cents. The number has already reached 42 per cent and it is thought it may go as high as 80 per cent.

Union men at the meeting scorned the suggestion of a 20 per cent cut and adopted a resolution authorizing their officers to call for an immediate strike vote unless the company would agree to a renewal of the present contract for another year. President Blair in making his proposal stipulated that the new rates would be retroactive to July 2 and should continue for one year "unless there be a change by competent authority during said one year period in the fare rates authorized to be charged." Other help are to be cut.

Two days later when the union officials called on Mr. Blair they were told that it would be impossible to keep up the present rate of pay as demanded by the men. Mr. Blair said:

> If the men you represent are of the opinion that our proposition of June 30, 1922, asks the men to assume more than their fair share of the reduction in our rates of fare, we will give careful consideration to any counter proposal which may be made on behalf of the men; and if, unfortunately, we cannot come to amicable adjustment we stand ready to refer our differences to arbitration.

Union officials said they had no authority to consider anything but a promise to renew the existing scale and they would have to proceed with the strike vote which was set for July 10. They were quoted by the newspapers as blaming Mayor Thompson and his lawyers for playing politics with the Surface Lines and letting other utilities alone. It was pointed out that the Illinois Commerce Commission, which is said to be friendly to the city administration, had suggested that a fair rate of pay for the men would be about 60 cents and the city lawyers had urged changes in working conditions.

On July 8 Mayor Thompson made public copies of a letter which he had addressed to the state board of arbitration suggesting that they take the situation in hand so as to prevent a tieup of transportation. It was stated that neither the company nor the men would look with favor on this board to prevent trouble. Rumors were abroad that in the event of trouble the city would endeavor to take over the lines and that if necessary the Governor would use State troops to move the cars.

ELEVATED EMPLOYEES THREATEN RAILWAY

Decision of the elevated employees to take a strike vote was announced on July 10 after President Budd had informed a committee that he would be unable to meet the demands. He said:

> Changes in rates of fare and wages on the elevated are inevitable in the near future. A reasonable revision of wages is necessary, and it should be brought about without inconvenience to the public, which has generously and without protest paid higher fares during the period of high prices. Wage readjustments in the electric railway industry began more than a year ago and in practically every large city in the United States, except Chicago, wages have been lowered, in many instances more than once. I strongly advise our employees against pursuing a course inimical to the public interest.
>
> Suspension of local transportation service in Chicago can have only one result. It will turn public sentiment against the employees, and we are servants of the public dependent upon its continued good will. With the good will of the public behind you there is, in my opinion, no probability of your being called upon to work for wages not commensurate with the character of the service rendered and the living conditions which obtain. Our companies have not profited by the higher fare. On the contrary the net earnings have been less, due to the increased cost of operation.

Mr. Budd also indicated that he would be pleased to continue negotiations.

The local city administration is attacked in a statement addressed to the public by officers of the local Amalgamated. Ridicule is rained on the traction experts for the city, not one of whom, say the union officers, lays claim to any street railway experience on the witness stand. Of the Mayor this is said:

> Now the Mayor wants arbitration by another state commission. His commerce commission hasn't succeeded in splitting the electric railway employees' organization in Chicago, as the motive to isolate the street car men in a wage cut contemplated. Now he wants another state commission to finish the job.
>
> How can any plan of arbitration settle the matter while the administration and its commerce commission are steadily moving for more wage cuts?
>
> If the plan of the city hall to establish 5-cent fares were carried out, and wage cuts followed on the basis of the present one, the train men would receive 20 cents an hour and other employees would have their wages wiped out entirely.
>
> If the car men and their families are to carry the load of the unreasonable political propaganda fare movement of the city administration, then the issue may as well be fought out now as at any other time.

Wage Scale Agreed On—Strike Ends

The strike which became effective on June 1 on the lines of the Mauch Chunk & Lehighton Transit Company, Mauch Chunk, Pa., was terminated on June 24, when a wage scale was agreed on amounting to 41 cents an hour for motormen and conductors. The old rate was 43¾ cents an hour. All other employees were reduced in the same ratio. With this reduction and other economies in operating expense the company which recently took over the railway hopes to put the road on a paying basis.

The line has not been a paying concern for a long time, and the directors decided for the best interests of all to sell the property. Negotiations were carried on for some time and it was sold to a New York syndicate, the members of which were to take over the road and operate it on June 1, 1922. The yearly wage and working agreement of the employees terminated on the same day. About May 16, the employees wanted a new agreement signed, but they were told that the old company could not act for the new company and that they would have to wait.

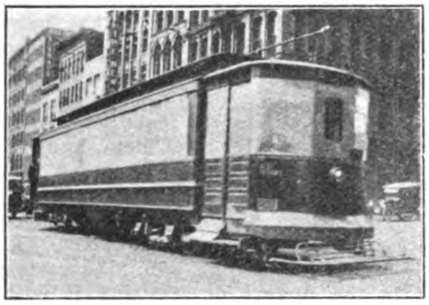
On May 11 the employees held a meeting and decided to quit work. At 3.30 on the morning of June 1, before the new owners had a chance to operate the road, the committee representing the employees called up the general manager on the telephone and notified him that the men would not work unless the new agreement was signed. The management and employees had a number of meetings, but could not agree. The new management then told the men it could not pay present wages as the receipts would not allow them, and suggested a lower rate. The men would not accept a reduction. Subsequent meetings resulted in an amicable agreement.

Service Being Restored in Buffalo

July 10 Marked Operation of First Car Since Strike There—This Was in Accordance with Promise of Mitten Management—Work of Rebuilding Entire Operating Force Well Under Way

WIRE-SCREENED cars guarded by motorcycle policemen and uniformed police in automobiles have been operated over several of the local lines of the International Railway, Buffalo, since 6 a.m., July 10, but no attempt has been made by the company to operate interurban cars on the Lockport, Niagara Falls or Lancaster divisions since the strike of platform men went into effect at midnight on July 1.

Very little disorder accompanied the running of cars. The police supplied the necessary protection. The company appealed for the state militia, but it was told that guardsmen would not be sent to Buffalo unless the situation grew so serious that the local police could not handle it. Practically no passengers were carried by the cars operated by the company.



CAR PROTECTED BY SCREENS BEING OPERATED IN BUFFALO

Each screened car is preceded by mounted policemen, motorcycle police and state troopers and is followed by an automobile carrying half a dozen members of the police riot squad equipped with sawed off shot guns. Two traffic supervisors of the International and four trainmen ride on each car. The new platform men have been brought to Buffalo as experienced crews from other cities.

Power house employees and practically all of the shop and track workers employed by the International are remaining loyal to the company.

CORRESPONDENCE PRODUCED IN EVIDENCE

Correspondence between Thomas E. Mitten, chairman of the board of directors of the railway, and W. D. Mahon, president of the Amalgamated Association, showing the existence of an understanding between the company and its employees covering working conditions for 1922 has been produced by the railway as a move to end the srtike.

Mayor Schwab had told Herbert G. Tulley, president of the International, that he would order the men back to work within twenty-four hours if the company would produce evidence of an understanding covering working conditions for the year. When confronted with the correspondence the Mayor insisted the evidence was insufficient and refused to intervene. The Mitten Management, Inc., then issued a statement which appeared in the newspapers as a strike bulletin, placing the blame for the continuance of the strike squarely upon the Mayor.

STRIKERS HAD UNTIL JULY 10 TO RETURN

Several times in the course of the past week the International has called upon the strikers to return to work under the terms of the understanding between Mr. Mitten and Mr. Mahon and it announced that those who did not report for work by phone or in person before midnight July 10 would lose their seniority rights as new employees will be engaged to operate the cars.

Efforts on the part of William Weatherwax, formerly superintendent of the traction lines in Chicago under Mr. Mitten, to bring about a settlement of the strike also failed.

Little was accomplished by the municipal authorities in their efforts to bring about resumption of service by appealing to the Public Service Commission in Albany for an order directing the International to resume adequate service and applying to the Supreme Court of Erie County for a temporary receivership for the International.

Only men with six months' experience in the operation of street cars will be allowed to run cars on the city lines of the International, Mayor Schwab informed the company. He also issued an order directing that all men brought from other cities by the company to operate cars or patrol its property should be finger printed and photographed by the police and their records thoroughly investigated so as to avoid all possibility of trouble.

HANDLING TRAFFIC IN BUFFALO BEFORE SERVICE WAS RESUMED

The Frontier Metal Trades Association, Buffalo, has issued a statement commending the attitude of the International on the open shop question and said that the closed shop is not a matter for arbitration. The association places at the disposal of the officers of the International its co-operation and assistance in maintaining the open shop principle.

While other Buffalo and Niagara Falls newspapers are for the most part remaining silent regarding the issues at stake in the strike, the Buffalo *Commercial* is loyally supporting the International in first page editorials featured daily. A few days ago the *Commercial* said:

> The *Commercial* confesses that it is at a total loss to understand what the striking employees of the International want. What are the men striking for anyway? Certainly it is not for more wages. We have it further upon the authority of Mr. Mahon and Mr. Conroy of the Amalgamated that the issue of the closed shop is not involved. They declare this is no fight against the open shop; that the International will be as free to employ men without the union as within.
>
> Now the men say they want recognition for the union. That is a new demand. But what does it amount to? The most perfect organization for bargaining over wages and conditions is to be found in the Mitten co-operative plan with the unit of labor represented in company employees.

Herbert G. Tulley, president of the International, in a statement to the men says:

> Those re-employed by the company after midnight July 10 will be rated as new men with a new seniority based on the time of re-employment. The bitterest aftermath of this strike will be experienced by the men who lose their seniority rights. You should carefully consider what your own best interest requires of you at this time. Regrets of tomorrow will not return to you this opportunity of today to sign up and keep your run.
>
> Experienced and trustworthy men have asked for this opportunity and will be given permanent places in filling these vacancies. Your choice is, therefore, now or never in so far as retaining your present seniority rights is concerned.
>
> The Mitten Co-operative Plan, which includes collective bargaining, will hereafter govern, and the maximum wage rate for permanent trainmen will be continued at 55 cents an hour for at least a year.

Highest Standards Upheld by Prospective Utility Advertising Association

Steps are now being taken which have for their object the formation of a Public Utility Advertising Association, which may eventually become a distinct department of the Associated Advertising Clubs of the World. An organization committee, headed by W. P. Strandborg, vice-president of the Associated Advertising Clubs of the World and publicity agent of the Portland Railway, Light & Power Company, Portland, Ore., was selected in June at the Milwaukee Conference of the Associated Advertising Clubs of the World.

The new organization will be open to the advertising sections of the American Electric Railway Association, National Electric Light Association, American Gas Association, American Telephone & Telegraph Company and the Independent Telephone Association, as well as to the various state committees on public utility information and individual companies engaged in serving the public with electric railway, gas, electric light and power and telephone service. Permanent organization is to be effected at the convention of the American Electric Railway Association in Chicago the first week in October.

Purposes and objects of the new organization as set forth in a tentative "Standards of Practice" to be submitted at the next meeting follow:

> Realizing our obligation and responsibility to the public, to the seller of advertising service, the advertising agent and our own organization, we, as general advertisers, pledge ourselves as follows:
>
> 1. To consider the interests of the public foremost, and particularly that portion thereof which we serve.
> 2. To claim no more, but if anything a little less, in our advertising than we can deliver.
> 3. To refrain from statements in our advertising which, through actual misrepresentation, through ambiguity or through incompleteness, are likely to be misleading to the public, or unjust to competitors.
> 4. To use every possible means not only in our own individual advertising, but by association and co-operation, to increase the public's confidence in advertised statements.
> 5. To refrain from attacking competitors in our advertising.
> 6. To refrain from imposing upon the seller of advertising service unjust; unreasonable and unnecessarily irksome requirements.
> 7. To furnish to publishers, when requested, technical information which will help them keep reading pages and advertising columns free from misstatements.
> 8. To refrain from and discourage deceptive or coercive methods in securing free advertising, and to do everything possible to aid the publisher to keep his columns free and independent.
> 9. To require standards for ourselves equal to those we set for others.

Meetings Continue on Reorganization Plan

W. Kesley Schoepf, president; Walter Draper, vice-president of the Cincinnati (Ohio) Traction Company, and Attorney Robert A. Taft, representing the Cincinnati (Ohio) Street Railway, attended the second meeting of the citizens' committee which has been named by Mayor George P. Carrel to solve the electric railway problem in Cincinnati. Mr. Schoepf went into detail on the history of the Cincinnati Street Railway and Cincinnati Traction Company and the effect of the double liability clause in the Ohio constitution on corporations. He stated that the Cincinnati Traction Company had been formed under the corporation laws of Ohio with a paid up capitalization of $2,000,000. At the same time the Union Traction Company of New Jersey was organized to finance the company. He recalled the repeal by a vote of the people of the double liability clause and the subsequent dissolution of the New Jersey corporation. Mr. Schoepf stated further that the Ohio Traction Company, successor to the Union Traction Company, controls only the Cincinnati Traction Company, the Traction Building, the Cincinnati Car Company and the Millcreek Valley lines.

Walter Draper, vice-president of the Cincinnati Traction Company, answering questions by members of the committee on the purchase of new cars explained that car trust certificates made it possible to pay off the cost of the new cars over a period of ten years.

At the conclusion of the meeting Mr. Schoepf declared that when the committee started going deeply into the traction investigation he would insist on the committee meetings being executive. The reorganization plan was referred to previously.

Favorable and Unfavorable Comment on New Franchise

The effort of the Louisville (Ky.) Railway for a new franchise agreement and compromise with the city in the fare rate is favored generally by business interests, the various clubs and civic organizations. The City Council, however, is objecting to the ordinance on the ground that the claimed valuation of $10,000,000 is too high. The matter has been placed in the hands of a committee. A digest of the franchise was given in the *Electric Railway Journal*, issue of July 1.

Charter for Kansas Interurban Line

The Arkansas City-Winfield Railway has been chartered with a capital of $300,000 to operate an electric interurban line between Arkansas City and Winfield, Kan. The line, now in operation is about 15 miles in length.

George Theiss, president of the Arkansas Valley Interurban, is working out plans for a connection between his line and the Arkansas City-Winfield line. The Arkansas Valley Interurban now operates a line from Wichita to Hutchinson and another to Newton. Electrification of lines leased from steam lines will connect Newton with McPherson and Salina. Negotiations on this electrification have been going on between Mr. Theiss and heads of the steam lines involved. If the connection is made between Wichita and Winfield there would be electric transportation connection between Salina at the most northern point and Arkansas City at the southmost point or a distance of approximately 125 miles.

Zoology for Railway Men

Zoology is intimately related to electric railway operation, so it turns out. It may be that a lot of operators are already in on the secret, but it is safe to say that most of them never stopped to consider the relation between the two. This was the case with H. R. Miller, efficiency engineer for the Keokuk (Ia.) Electric Company. He just went along from day to day, never for a moment associating the study of insects with his business until last June. And then the study of insects and their habits was forced upon him, for the district where the Mississippi flows between Illinois and Iowa and Illinois and Missouri was visited by an unusual plague of flitting things. The insects swarmed everywhere. And they stuck wherever they swarmed. The cities on the lower level suffered most, but cities on the bluffs also felt the inconvenience of the pest. In Fort Madison, Ia., the bugs were shoveled up and carted from the streets under the lights every morning.

As stated before, the insects swarmed everywhere. Of course, they ought to have respected the patrons of the street cars, but they didn't. In a number of instances they virtually took possession of the cars. Now you can kill an insect by catching it and squeezing it in the fingers or swatting it with a newspaper or a baseball bat, but none of these means appealed to Mr. Miller as he is of a scientific turn of mind and wanted to rid the cars of the insects without too much pain to the bugs. And then he remembered that the reaction of a ray of light upon the protoplasm of a bug, causing movement of the insect toward the light, depends upon the wave length of the light and is inversely proportional to the wave length. So Mr. Miller hadn't studied illumination or zoology for nothing, after all. He had a conference with A. C. Anderson, street railway superintendent of his company. They had lamp globes dipped red and installed them in a car. That car was free from bugs. The next night, all the cars of the Keokuk system were illuminated in red and have been bugless ever since.

The first lamps installed were too deep a red and caused some discomfort to sensitive passengers. The hue finally adopted is rose, which is not absorbed by palm beach suits or white dresses. This strikes the golden mean between the reactions on humans and on insects.

Passengers vote the idea a godsend. The ultimate origin of it is unknown. It is noticed that the bugs are not attracted by certain red lights in the dancing pavilion of the Keokuk Country Club, but enquiry fails to disclose whether they were placed for that purpose, or merely for decoration. It is believed that the Keokuk installation is the first time the lack of insect reaction to the red end of the spectrum was ever used by a public utility company for the purpose of increasing the comfort of the public it serves.

Edgar E. Clark to Head Transportation Institute

Edgar E. Clark, formerly chairman of the Interstate Commerce Commission, will, it is reported, head the National Transportation Institute, the organization of which is being considered in Washington. An account of the original plan of this Institute was published on page 947 of the issue of this paper for June 10. President Harding has indorsed the plan in a letter to Representative Sidney Anderson of the Joint Congressional Commission on Agricultural Inquiry. The president said:

> The broad and outstanding study of the entire transportation problem is unquestionably a serious national matter—indeed I think I may well say a serious world necessity at this time. Such an organization as you are proposing ought to become a power in connection with the nation-wide consideration of these problems and a useful directing force in connection with the dissemination of public policy.

Senator Cummings of Iowa, chairman of the Senate Interstate Commerce Commission, said nothing was more needed at this time than an organization to ascertain the truth respecting transportation and to disseminate the facts brought out. His remarks were of course presaged on the understanding that the institute would be wholly disinterested in conducting its work.

Letters favorable to the plan have been received from others prominent in national affairs.

Paper Praises Council's Act

The City Council of Toledo, Ohio, was recently made a subject for the praise of the Toledo *Times* because of its stand in the matter of paving charges. The City Council granted Commissioner Cann's request to relieve the Community Traction Company from paving expenses. The *Times* in commenting on this action says that the matter of paving between electric railway tracks is an item of public improvement which is properly chargeable to the taxpayers and should not be paid by the car riders because paving is no longer necessary to street railway operation. The editorial comment in part is as follows

> In granting Commissioner Cann's request, Council is merely assisting him to carry out the wishes of the people expressed when they selected the Milner ordinance over the alternative street car-bus plan. The guiding principle of this ordinance is that the car riders shall pay for precisely what they get, allowing the operators a fixed reasonable return on the capital actually invested.

Elec-trac News Makes Début

The Paducah *Elec-trac News* has made its début and will come out twice every month with some interesting information on Paducah's electric utilities—"What they are doing, what they hope to do, to give Paducah the best possible service." The pamphlet is presented by the officials and employees of the Paducah Electric Company and the Paducah Railway. As announced the paper is designed with a two-fold purpose. It aims to stimulate the spirit of co-operation, loyalty and efficiency in service and to disseminate real news concerning the men engaged in Paducah's municipal activities.

The aim of the pamphlet to stimulate loyalty is carried out in the first issue, which contains a picture and write-up of Elec-trac "Bill," formerly known as N. H. Bethel, who has been in the service of the Paducah Railway since 1883.

Working Agreement Renewed

Trainmen of the Ontario Hydro-Electric Commission operating in Windsor have accepted the commission's offer to renew the working agreement. Recently, the commission informed the men that a wage cut of 5 cents an hour was to be made. The men replied that a cut would mean a suspension of service or an application to the Dominion Government for a Board of Conciliation. The men's request for 10 cents additional for the operators of one-man cars and trackless trolleys has been rejected.

Action on Paving Petition Deferred

A public hearing was recently held on the petition of the Charleston (S. C.) Consolidated Railway & Lighting Company that its franchise be modified so as it would be relieved from unfair paving obligations. All who addressed the meeting were in favor of the petition. However, the committee of the whole adopted Alderman Sinkler's motion that final action be deferred until the August meeting of the City Council. The request of the railway was referred to in detail in the *Electric Railway Journal*, issue of June 3.

Milwaukee Purchase Proposal Making Progress

Martin Glaser, engineering and statistical expert for the street railway acquisition committee at Milwaukee, Wis., plans to confer in New York shortly with officials of the North American Company, holding company for the Milwaukee Electric Railway & Light Company.

Fred S. Hunt, chairman of the committee, is reported to have said:

> We have agreed on one thing—the basis for valuation. This will be the 1914 valuation of the Railroad Commission, plus additions. The company insisted on replacement value of its property and the committee held out for the historical value, or actual cost to the company. These figures were about the same, however, so far as the 1914 properties.
>
> One of the intricate problems before the committee is whether we shall agree on too high a value for the property and then insist on a small rate of return or hold the property down to a low value and permit a higher return.

More Buses for Baltimore.—The Baltimore (Md.) Transit Company, affiliated with the United Railways & Electric Company, planned to put into operation on July 15 a complete fleet of twenty-six Republic Knight-motored buses.

News Notes

Arbitrators Are Selected.—Attorney Frank F. Dinsmore has been selected as arbitrator for the Cincinnati (Ohio) Traction Company and Attorney J. H. Vahey of Boston, Mass., has been selected as arbitrator for the Street Car Men's Union to seek an adjustment of the wage question and working conditions proposed in the new contract between the two organizations. The two arbitrators have until July 20 to agree on an impartial chairman. If they fail to agree then the State Industrial Commission will make the selection.

Treasurer Stockwell Suffers Loss.—Mrs. Laura A. Stockwell, wife of Fred F. Stockwell, of the Barbour-Stockwell Company and treasurer of the New England Street Railway Club, died on June 29 after an illness of three days, at the Sylvester Hospital in Allerton. Mrs. Stockwell was almost as well known to the women of New England as is Mr. Stockwell among the men. She was a member of Ramona Rebekah Lodge and of the Eastern Star. She was born in Chelsea, Maine. She leaves her husband and four children.

Cut in Wages Announced.—A new contract has been made between the management of the Inter-City Terminal Railway, North Little Rock, Ark., and twenty-five of its employees. An announcement to this effect was recently made by P. C. Warren, manager of the company. Under the terms of the new agreement the men will receive 3 cents an hour less than they did under the terms of the old contract. The new wage scale is 38 to 40 cents an hour and the old scale was 41 to 43 cents an hour. Younger men in seniority in the service receive the lower pay. The contract is for a year and is dated from July 1.

Fights for Car Line Space.—The Toronto Transportation Commission failed in the attempt to induce the Board of Control of Toronto to interfere with the sub-dividing of the Nordheimer estate. The trustees of this estate have been forming plans to divide the huge estate in building lots and offering the lots for sale. The commission wanted to have a street 80 ft. wide cut through the property so that car lines could be built through the estate. The members of the Board of Control are of the opinion that the cost to the city would be excessive. Commissioner Harris, the spokesman of the commission, in the attempt to get the Board of Control to take over the strip in the Nordheimer estate, thinks the cost will be $1,000,000 to start with, and there will be about $700,000 necessary for improvements.

Financial and Corporate

New Company Ready

Springfield-Troy Railway Authorized to Issue Bonds—Chamber of Commerce Indorses Plan

Final details for the taking over by the newly-organized Springfield-Troy (Ohio) Railway of the properties of the Springfield Terminal Railway. & Power Company, including the Springfield, Troy & Piqua traction line, will be completed before the option on the property expires on July 16, according to an announcement made by officials of the new company. The new company expects to exercise its right of purchase under the option on July 15.

It is the aim of the new company to furnish passenger and freight service through use of gasoline-propelled cars, as well as to supply electricity to municipalities along its lines. The company will not produce the electric power itself, but will purchase it from the Springfield Light, Heat & Power Company with whom tentative details of a contract have already been arranged.

Officers of the new company are: C. G. Taylor, president and general manager, Norwalk, Ohio; Henry H. Durr, first vice-president; B. F. Kaufman, second vice-president; D. A. Glover, secretary and treasurer. Directors are: Henry H. Durr, Springfield; A. J. Bright, Christiansburg; B. F. Kaufman, Springfield; A. D. Bowen, Elyria; Henry Pauley, Troy; D. A. Glover, Elyria; C. G. Taylor, Norwalk, and L. F. Bowell, fiscal agent.

CO-OPERATION PLEDGED

The State Public Utilities Commission has authorized the company to issue first mortgage 7 per cent gold bonds in the sum of $250,000, of which $200,000 is to be outstanding, and common stock to the amount of $250,000. The bond issue will be secured by first mortgage on all of the property of the company which has an approximate valuation of $400,000. Representatives of the new company are meeting with marked success in securing subscriptions to the stock and bond issues, as well as pledges of co-operation on the part of manufacturers in Springfield and other points touched by the line.

The Springfield, Troy & Piqua Company went into the hands of a receiver about two years ago. For some time after the receivership was authorized, the receiver attempted to operate the line, but financial results were such that service was abandoned about fourteen months ago. Since then, only a shuttle car operating between the plant of the Victor Rubber Company at Maitland, and Springfield, for the benefit of the Victor employees has been in service.

Residents along the line expressed themselves as being willing to back a reorganization by buying bonds and such a move was attempted about four months ago, but the deal fell through. After an investigation of the possibilities of the section traversed by the traction line, the new company was formed. The proposal is being given the active support of the Chamber of Commerce.

Track Removal Ordered—City Wants to Pave

Removal of the tracks of the Saginaw-Bay City Railway, Saginaw, Mich., from the streets was ordered by the Council on July 11 in a formal resolution instructing the City Attorney to obtain permission from the United States District Court for permission to proceed with the work. The company has not operated cars since it went into bankruptcy on Aug. 10, 1921. The company's franchise was forfeited by the Council on Oct. 21, 1921, on the grounds that it had failed to fulfill its contract with the city and on March 25, 1922, an ouster ordinance was passed, calling upon the company to remove its tracks and overhead construction from the streets within ninety days. Now the City Council wants to do paving along certain streets and permission will be asked of the United States District Judge to remove the tracks or cover them over as the city deems best for its paving program.

American Water Works Company Expanding

Plans for the expansion of the system of the American Water Works & Electric Company, Inc., Pittsburgh, Pa., through the acquisition of the Monongahela Power & Railway Company and the Potomac Public Service Company have about been completed, it is announced, adding approximately $8,250,000 in annual gross earnings to the company.

Of this amount approximately $6,000,000 will be contributed by the Monongahela property and $2,250,000 by the Potomac Company. This will bring total gross earnings of the system up to approximately $28,000,000 annually. The acquisition of these two properties will extend the system of the American Water Works & Electric Company well into West Virginia and Maryland.

The statement of the American Water Works & Electric Company, Inc., and subsidiary companies, including the West Penn Company, for the month of May, shows gross operating earnings of $1,641,914, an increase of $19,053 over the corresponding month of 1921; net earnings of $544,904, an increase of $72,641; gross income $609,088, an increase of $73,782; net income, after all charges, $91,069, an increase of $15,185.

Conversion Plan Only Partially Successful

The plan of the United Railways & Electric Company, Baltimore, Md., to permit owners of first mortage 4 per cent bonds maturing in 1949 to increase the interest thereon to 6 per cent upon the payment of $250 for each $1,000 bond, proved only partially successful. It is estimated that about $3,000,000 of bonds were so deposited.

For reasons which are more or less difficult to discuss, say Nelson, Cook & Company, local bankers, there seemed to exist an antipathy in the public mind against the acceptance of this proposition. One of the objections was the opinion frequently expressed that the proposal should have come directly from the company itself instead of through a bankers' committee.

The bankers contend that this certainly did not constitute a valid objection to a plain business proposition. The future alone, they say, will prove whether or not the holder of the 4 per cent bond who paid $250 and converted it into a bond bearing 6 per cent interest, bettered his position. They are of the opinion that the future will show that he did. In commenting on the position of the company the bankers said:

> The payments received from bondholders who deposited their bonds, together with funds already in hand and available for these purposes, will probably place in the company's hands the funds really required to retire all the notes due on Aug. 15.
>
> It has been reported in the press that the United Railways will indulge in further financing. This may or may not prove correct, although we understand the matter has the consideration of the board of directors.
>
> As stated above, the company is in possession of all the funds needed to meet the maturities of the 5 per cent and 6 per cent notes due on Aug. 15. At the same time, considerable sums have been expended in improvement, equipment, etc., which are actually capital expenditures. Therefore, it may not be amiss, in view of these maturing securities and the release of such a large sum of money for reinvestment at this time, for the company to come into the market and definitely finance these capital expenditures, thereby, through the issue of a long time security, placing itself in an unusually strong cash position for some time to come.
>
> Such financing, however, is by no means an assured fact as we understand the matter is simply under advisement.

The plan for conversion was the subject of editorial comment in the issue of the *Electric Railway Journal* for July 1, page 2.

Public Auction Sale of Spartanburg Property

George B. Tripp, receiver for the South Carolina Light, Power & Railways Company, Spartanburg, S. C., has announced that all properties of the company are to be sold at public auction at Spartanburg, on July 31, under order of the federal court.

It was announced some time ago that the bondholders of the company were working out a plan whereby a successor company would begin functioning in July of this year. Counsel for the bondholders had appeared before the Federal Court and had submitted details of the proposed reorganization. The details were given in the *Electric Railway Journal*, issue of May 6.

Binghamton Road Organizes Permanently

The permanent organization of the board of directors of the Scranton, Montrose & Binghamton Railroad, Binghamton, N. Y., was effected at a meeting on June 26. The directors named are as follows: H. S. Fleming, New York; Frank L. Fuller, Binghamton, N. Y.; R. W. Day, C. C. Ferber, F. W. Wollerton, W. L. Connell and A. Widdowfield.

H. S. Fleming was elected president; R. W. Day, vice-president and general manager; A. Widdowfield, secretary; F. W. Wollerton, treasurer; J. J. Moffat, assistant treasurer.

The Scranton, Montrose & Binghamton Railroad controls the Binghamton Railway, by stock ownership. Application has been made to the United States Court to take the Binghamton Railway out of receivership.

A high-tension transmission line to Binghamton, N. Y., was recently completed and has been furnishing electric current since Jan. 1 to operate the Binghamton Railway and for commercial lighting in Endicott, New York.

Benton Harbor Property Sold

Control of the Benton Harbor-St. Joseph Railway & Lighting Company has been purchased by the Indiana & Michigan Electric Company, South Bend, Ind., for $1,200,000. This gives the South Bend company control of the electric power distribution to practically all important towns in St. Joseph and Elkhart Counties in Indiana, and Berrien, Cass and St. Joseph Counties in Michigan. The deal also gives the South Bend company control of the interurban lines connecting St. Joseph with Dowagiac and Watervliet, Mich. The company will now further expand by erecting a dam costing $1,000,000 in the St. Joseph River.

Hoboken Line Discontinued

A recent decision of the Board of Public Utility Commissioners of New Jersey has approved the discontinuance of the Washington Street line of the Public Service Railway in Hoboken. The abandonment was authorized, however, with the condition that the West New York line take care of certain traffic. The Public Service Railway agreed to this provision. It was shown that there were only five passengers per car, that jitneys paralleled the line and that the West New York cars covered the same territory. At first Hoboken opposed the abandonment.

Utility Maturities Large for Balance of 1922

The total of public utility issues maturing in the last six months of 1922 amounts to $261,921,600. This figure compares with $211,623,240 in the same period a year ago and $60,729,000 in 1920. Among the large issues is the Union Traction Company of Indiana $4,623,000 first 5 per cent bonds due July 1. The Interborough Rapid Transit Company has $39,199,000 of 8 per cent extended notes due on Sept. 1. Under the agreement between the security holders of the Interborough Rapid Transit and the Manhattan Elevated Railroad these notes will be extended ten years.

Financial News Notes

Service to Be Stopped.—The Sacramento Northern Railroad, Sacramento, Cal., has received permission from the State Railroad Commission to discontinue service to West Sacramento.

Wants to Issue Bonds—Application has been made to the Georgia Railroad Commission by the Valdosta Street Railway for permission to issue $100,000 of 6 per cent bonds, the money to be used to extend the company's lines and to establish recreation parks.

Property in New Hands.—A New York syndicate took over the operation of the Mauch Chunk & Lehighton Transit Company, Mauch Chunk, Pa., on June 1. The new president is Rolland A. Davidson, with offices at 15 Park Row, New York City, and the Secretary is V. M. Wolff.

Railway Issues Approved. — The Board of Public Utility Commissioners of New Jersey recently authorized the Morris County Traction Company, Morristown, N. J., to float an issue of $1,600,000 mortgage bonds, $1,500,000 of preferred stock and $1,179,000 of common stock.

Receivership Ended.—The Northampton Traction Company, Easton, Pa., has passed from the hands of receivers and has been reorganized as The Northampton Transit Company. Chester Snyder, who served as receiver for the company, has been elected president. No other personnel changes were made at the time of the reorganization. The terms of the reorganization were published previously.

Officers Chosen.—Following the purchase of a majority of the stock of the Stark Electric Railroad, Alliance, Ohio, by a syndicate in that community, officers have been elected to head the organization. M. S. Milbourne, has been chosen president, C. Y. Kay, vice-president, William E. Davis, secretary, and S. L. Sturgeon, treasurer. All are residents of Alliance. No changes were made in the other offices.

System on Sound Basis.—In his report of the year Finance Commissioner Ross of the City of Toronto says that the transportation system of the city is on a sound financial basis; that fares charged are sufficient to meet all expenses of operation so citizens need have no fear that they will ever be called upon to shoulder any deficits. In his opinion hydro has saved the citizens of Toronto twice the original investment.

Asks for Receiver.—According to a recent finding of Judge Swartz a receiver will probably be appointed to work out the financial difficulties of the Montgomery Transit Company, Norristown, Pa. The matter came before the attention of the court through the action of J. Rich Grier, Otho Newland and C. S. Newall brought against the railway company, the Norristown Trust Company and the Liberty Title & Trust Company as trustees.

Must Pay State Franchise Tax—In the case of the State of Alabama versus Lee C. Bradley the receiver for the Birmingham Railway, Light & Power Company, a decision of considerable importance to all service corporations in Alabama has been returned by the Supreme Court, to the effect that a corporation, even though it may be operating in the hands of a receiver, must continue to pay the state a franchise tax as levied by the constitution of 1901.

Preferred Stock of Bangor Company Offered.—About $470,000 of 7 per cent cumulative preferred stock Class B, of the Bangor Railway & Electric Company, Bangor, Me., is being offered for subscription at 101 and dividend by Beyer & Small, Portland, Me. The stock is not subject to redemption. The new stock ranks equally with the old issue except that it has no voting power. The proceeds from the sale will be used to purchase new properties and for capital requirements.

Manhattan Deposit Time Extended.—More than 60 per cent of the stock of Manhattan Railway, New York, N. Y., has been deposited or pledged for deposit under Judge Mayer's plan of readjustment of the company's relations with the Interborough Rapid Transit Company according to Alvin W. Krech, chairman of the Manhattan Railway stockholders' protective committee. In giving notice that the committee has extended the time in which further deposits may be made up to and including July 25, 1922, Mr. Krech states that unanimity of action is necessary to effect the plan and that failing this receivership will be inevitable.

Surface Line Valuation Case Closed.—The New York Transit Commission on July 10 closed its hearings on the valuation of the properties of the New York Railways. John H. Madden, valuation expert for the commission, was recalled and re-examined by Judge Shearn as to the methods by which he arrived at his calculations and the various items in the report he had submitted. The commission gave leave to Counsel Reynolds for the railway to file a memorandum. In the case of the hearing of the Third Avenue Railway, set for July 10, an adjournment was ordered for two weeks owing to the illness of counsel for that company.

Traffic and Transportation

329 per Cent Overload

Municipally Operated Line on Staten Island Has Frightful Service Record

Case No. 2656. Hearing of June 20. General Lincoln C. Andrews, chief executive officer of the New York Transit Commission, presiding. Solemnly announced: In the matter of the hearing on the motion of the commission upon the regulations, practices, equipment, appliances and service of the Staten Island Midland Railway and of Mortimer Brenner and Grover Whalen, as receiver and operator.

The appearances are noted. The newspaper men present yawn a yawn of despair and prepare for their daily snooze. It is a warm day. Moreover, it has been a long while since the sessions of the commission have provoked any real copy. Enthusiasm is at the zero hour.

Edward A. Roberts is duly sworn. After considerable questioning the fact is brought out that Mr. Roberts is chief of the transit bureau of the commission. Yes, Mr. Roberts is fairly familiar with the lines of the Staten Island Midland Railway. It is established that the road is being run by the city of New York under the direction of the head of the Department of Plant and Structures. Mr. Roberts knows that one of the lines runs from Port Richmond to a point near Eckstein's brewery. Just how near to the brewery is not brought out. Evidently it doesn't matter now, although it might have been different a few years ago.

Captain Cooke, if the commission please, would incorporate into the record the commission's standard of street railway operation. Of course the commission is pleased. As if this were not enough Mr. Roberts specifies the four principal elements of service: (1) cars must run at regular intervals; (2) the cars must be comfortable; (3) the speed should be the maximum consistent with safety; (4) the cars should operate at intervals sufficiently frequent to serve the best interests of passengers. Mr. Roberts is dismissed.

F. G. Daniel is called. He confesses to holding the position of assistant electrical engineer with the commission. There doesn't appear to be any direct reference in what Mr. Daniel said of any knowledge on his part of Eckstein's brewery, but he did know a lot about the physical condition of the line. According to Mr. Daniel there is nothing to prevent the company from giving good service except the physical condition of the road, and that was terrible. Mr. Daniel said this just casual like. The reader should note it carefully. It is going to loom up later in large letters.

William H. Freeman called. He has been with the commission fourteen years as a railway engineer. "Have you," asked Mr. Cooke, assistant counsel for the commission, in addressing Mr. Freeman, "at the request of the commission made or had made under your supervision an inspection of the rolling stock of the Staten Island Midland Railway?" He had. And this is what he found: A total of eighty-one cars, thirty-three of which were out of service. Of twenty-six of the single-truck safety cars examined on May 31 the percentage of those that needed repairs was:

	Per Cent.
Painting	65
Destination signs dirty	100
Cars with broken glass	50
Curtains missing	34
Hand brakes stiff	23
Air gage glass or hand missing	23
Sand box pipe missing	23
Air gage out of adjustment	15
Doors and steps out of adjustment	23
Seats broken	12

Fifteen of the double-truck closed cars were examined and a list of needed repairs and percentages of cars on the same basis as the safety cars is given below:

	Per Cent.
Line switch inoperative	100
Curtains missing	27
Journal boxes worn	47
Glass broken	53
Platforms sagging	60
Destination signs dirty	60
Doors and steps out of adjustment	20
Brake rigging worn	20

June 22. Hearing continued. W. O. Smith the witness. Mr. Smith, it appears, is supervising inspector in the transit bureau of the commission. Charts, tabulations and other figures presented in evidence. What do they show? Well, for one thing, that operation of this municipal line is always irregular, but particularly so during the non-rush hours. It appears also to be a chronic case of excess of passengers over seats. "Compared with standards of proper operation," asks Counsel Cooke of Mr. Smith, "what would you say as to the showing made by these counts?" "They show," said Mr. Smith, "the service is inadequate in both morning and evening rush hours and during twenty-nine non-rush hour periods."

At another point Mr. Smith said that the overload on the Richmond line varied from a trifling one to as high as 329 per cent. This was in the morning rush. In the evening rush the overload at one period was 234 per cent.

July 6. Hearing continued. Harry S. Fischer, statistician for the commission, the principal witness. Basing his testimony on the company's reports, Mr. Fischer said that from Dec. 1, 1920, to March 21, 1922, the company showed a deficit of $400.72. While the general balance sheet showed a surplus of $4,806.37 as of June 30, 1921, he said, a net debit adjustment charged after that date left the deficit mentioned on March 21, 1922.

For the ten months' period ending April 30, 1922, said Mr. Fisher, the total operating revenue was $334,640 and the total operating expenses $311,228, which, with deduction for taxes of $14,445, left a total income for street railway operation of $8,966. There was a non-operating income of $824, making a gross income of $9,790, from which $9,745 for interest was deducted, leaving a net corporate income of $45 for these ten months.

Such in brief is the record made by the city of New York in running its little road down on Staten Island and as brought out by the New York Transit Commission in its general inquiry into the traction situation under direction from the Governor and the Legislature.

One-Man Car Not to Blame for Accident

J. P. Wadhams, assistant engineer of the Connecticut Public Utilities Commission, has submitted his report on the accident in Meriden on June 18, when a one-man car of the Connecticut Company injured a passenger and two occupants of an automobile and damaged five other automobiles. He believed that the failure of human agencies to perform prescribed duties and not the type of car in use was the cause of the accident. His investigation convinced him that the presence of an additional man would not have prevented the accident. He suggested as a remedy that the company's attention he called to a previous recommendation on instructing motormen in such measures as are necessary to prevent a car getting beyond control. He further suggested the installation of air buttons in all cars, inside a small cabinet plainly marked "air button."

Rerouting Ordinances Passed

After a delay of nearly two years the City Council of Cincinnati recently passed ordinances rerouting twenty-five routes of the Cincinnati (Ohio) Traction Company in the business section of the city. The rerouting plan does not call for the construction of any new track except the installation of a few low curves. The report of the Council committee states that it is apparent that the benefits accruing from the installation of the rerouting plant will be: (1) the speeding up of cars and the rendering of better service and (2) the cutting down of expenses of operation which ultimately will be reflected in lower fares.

The various ordinances passed will become effective within thirty days, unless they are subjected to a referendum. W. Jerome Kuertz, Street Railroad Director, said that the entire rerouting plan will not be put into effect, however, for aproximately three months. It is understood, however, that the routes that will not require special construction will be changed as soon as the thirty days referendum period has expired.

Terre Haute's Toonerville Trolley

Whimsical Description of Special Station Service Written for Local Paper

Terre Haute has a Toonerville trolley. At least that is the way the *Saturday Spectator* of Terre Haute refers whimsically to the line which is run between Union Station and Wabash Avenue by General Manager E. M. Walker of the local company as a special service.

As the *Spectator* sees it, running the car is the least of the duties of the conductor, G. W. Ellis. As the door swings open and you alight from the car at Union Station did you ever notice, says that paper, the little old man who takes your bag and helps you down the steps? If you are heavily laden, old, or have several children with you, he carries your packages into the station and perhaps even helps you check your baggage.

This man, the conductor of the emergency car at Union Station, meets every train that comes in. With a rosebud or a ragged robin in his coat lapel, his cap tilted at a jaunty angle on his white head, and a smile on his face, he welcomes all travelers entering and leaving Union Station.

His car, the emergency car, is switched on a side track, and if a train happens to draw into the station when the regular street cars are not there, Mr. Ellis invites prospective passengers into his car and takes them to town. Before the emergency car was put on travelers often had to wait ten or fifteen minutes for a street car. Now there is always one at the station.

STRANGERS APPRECIATE COURTESY

"Some days I never leave the station," said Mr. Ellis. "Others I make as many as five or six trips to town and back. But I'm always busy directing people and helping them with their baggage. If I see a stranger, I go up to him, ask him where he wants to go, and tell him how to get there.

"I pride myself on the fact that no one has yet asked me a question I couldn't answer. I've studied up on Terre Haute and Terre Hauteans and I think I could answer any question that could be asked of me about them.

"I direct people to the hotels, to the stamping mills, the hospitals, the river; tell them who the most influential men are, Terre Haute's chief industry, and a hundred and one other things. But if they talk to me for any length of time, I convince them that Terre Haute is the garden spot of the world. I tell all the good points but fail to mention any drawbacks.

"The park in front of the station gives strangers a good impression of the city right at the start. The women especially always comment on it and admire it.

"If a blind person happens to get off the street car, I always lead him into the station, help him to get his ticket and check his baggage. Or if a mother with several children happens along, I help her get settled. I never let old people carry their baggage. I always take it into the station for them.

"Many of the people take my help as a matter of course. But others comment on it and ask how I happen to do it. Then I tell them about the emergency car and how the traction company wishes to welcome strangers to Terre Haute, not by making them wait for a car to take them to town, but by always having some one there to greet them when they arrive and to help them in every way possible.

"They say that Terre Haute is a friendly city—that they know of no other place in the United States having such a system of welcoming strangers.

"There comes a woman now who looks as if she didn't know exactly where to go. I guess I had better go help her," he said, as he pushed his cap over one ear and started off.

A relieved look spread over the face of the bewildered looking stranger as Mr. Ellis, his own face aglow, stepped up to her, took her bag, and ushered her to the car with as much ceremony as a knight of old would have attended a queen.

Newspapers Indorse Jitney Regulation

Favorable reflection is found in the press of Connecticut just across the border from Rhode Island of the regulation of jitneys in the latter State which went into effect on July 1. All the roads in Connecticut suffered frightfully from the jitney before the recent regulation there, but none of them more so than the lines included in the system of the Shore Line Electric Railway operating to the beaches in both Connecticut and Rhode Island.

A considerable measure of protection came to the company under the Connecticut regulatory act of a year ago. Now similar protection is to be afforded in Rhode Island. The extent to which this is so in Rhode Island was indicated in the *Electric Railway Journal* for July 8, page 63.

The Westerly *Sun* said recently:

> The State Public Utilities Commission did a good thing not only for the trolley cars of this State but the public as well when it abolished practically every jitney and bus route in the State of Rhode Island July 1. Perhaps the sweeping decision to wipe out the jitney cars which run on regular routes will not be final. But the public utilities are going to find out if the trolley business cannot be made a paying one and so conducted that better service may be given, perhaps at reduced costs. The board believes then that the public will see the uselessness of a foolish competition, which in the end will give no one service.

The Norwich *Bulletin and Courier* said:

> What appears to be a determination to give the needed co-operation that will permit the trolley lines to meet the expense of operation, get a reasonable return for the service rendered and to meet the requirements of the public in the way of service is disclosed by the action of the utilities commission in Rhode Island, where the jitneys have been eliminated.
>
> This does away with that unfair competition, and means that the electric lines are to be given a fair chance to meet the transportation requirements of the public. It is of course an attitude which is no more than ought to be expected.
>
> Rhode Island has come to the same conclusion that other states have. It is not a time to drive existing companies to the wall. Improved service is to come from just such methods as are being employed in this state and which are now adopted in Rhode Island and with the unfair competitors eliminated there will be reason in the insistence upon the improvement of the service just as fast as the trolley lines are able through the patronage provided to accomplish it.

Transportation News Notes

Token Passengers Increasing—The number of token passengers on the lines of the Public Service Railway, Newark, N. J., is increasing each month. A little more than half of the people who travel on the cars use tokens.

Reduces Fares Within Albany.—The Schenectady (N. Y.) Railway has made a reduction in fares from 8 cents to 7 cents on its lines which operate over the United Traction Company's tracks in Albany. A recent decision of the Public Service Commission reduced the fares of the United Traction Company.

Lower Fare Ordered.—Following a session of the City Commissioners of St. Augustine, City Manager Masters was instructed to notify the St. Johns Electric Company to reduce its fare from 6 cents to 5 cents. The 6-cent charge was authorized during the war to continue for six months after the declaration of peace.

Emergency Increase Denied.—The Alabama Public Service Commission has refused the application of the Mobile Light & Railroad Company for permission to increase fares from 7 cents to 8 cents. This increase was sought as an emergency measure pending the valuation of the company's property. The valuation matter is now before the commission.

New Line Started.—The Springfield (Mass.) Street Railway on June 5 instituted service on its new line from Carew Street through East Springfield to Berkshire Avenue, on the route to Indian Orchard and Palmer. This line was built last year. It accommodates industrial workers of East Springfield, Indian Orchard and Chicopee Falls. Hourly service is maintained.

Fares Cut in Boulder.—The Boulder (Col.) Street Railway recently announced a reduction in fares averaging 20 per cent. The price of books of twenty rides has been reduced from $1.50 to $1.25. Strips of seven tickets are being sold for 50 cents. The single cash fare remains at 10 cents. C. A. Semrad, general manager of the Western Light & Power Company, operating the local lines, explained that the reductions were made in the hope that they would induce the public to patronize the lines more freely.

Personal Mention

J. A. Greenland Appointed Transportation Superintendent

J. Allan Greenland, who has been general passenger and freight agent of the Indiana Service Corporation, Fort Wayne, Ind., has been appointed superintendent of transportation and traffic. In this capacity his jurisdiction in transportation and traffic matters will extend over the Fort Wayne & Decatur Traction Company and the Fort Wayne, Van Wert & Lima Traction Company, as well as over the Indiana Service Corporation. By his advancement Mr. Greenland fills the vacancy caused by the resignation of R. N. Hemming, who recently became associated with the Railway Audit & Inspection Company as the manager of that company's Detroit office.

Mr. Greenland has been engaged principally in steam and electric railway work since his graduation from Roanoke College, Salem, Va., in 1904. After the completion of a three-year course there, he served for eighteen months in the engineering department of the Lake Shore & Michigan Southern Railway in the development of its lines in eastern Pennsylvania. Temporarily leaving the railroad industry, he was engaged in the general builders and supply business for three years at Roanoke, Va. For the following three years he was connected with the Cleveland & Erie Railway at Girard, Pa., in the traffic and transportation department. Mr. Greenland received his appointment as general passenger and freight agent of the Fort Wayne & Northern Indiana Traction Company in 1911. He has held this position until his new assignment, which became effective on May 15.

Mr. Greenland was born in Clarion, Pa., on Sept. 18, 1881.

Samuel W. McCall an Eastern Massachusetts Trustee

Homer Loring has resigned as chairman of the public board of trustees of the Eastern Massachusetts Street Railway and former Governor Samuel W. McCall has been appointed by Governor Cox of Massachusetts to fill the vacancy. The salary is $5,000 a year.

Arthur G. Wadleigh, who was a member of the board, has been designated as chairman of it. Mr. Wadleigh is a lawyer, formerly city solicitor of Lynn, and a former member of the Massachusetts Legislature, and by the consent of all the attorneys in the case he took the leading part for the communities at the time the fares and districts of the Eastern Massachusetts were investigated by the Public Utilities Department.

The appointment of former Governor McCall was confirmed by the Governor's Council on July 12, the same date that the nomination was made, under a suspension of the rules. He has been a prominent figure in Republican politics for many years, as a member of the Massachusetts Legislature and a member of Congress. Mr. McCall was Governor from 1916 to 1919, when he was succeeded in that office by Calvin Coolidge.

S. L. Vaughn a Modern Manager at Grand Rapids

With the remark that "old-time railroading was not much like the present," S. L. Vaughn, vice-president and recently appointed general manager of the Grand Rapids, Grand Haven & Muskegon Railway, Grand Rapids, Mich., shows that he is a modern of the moderns. He knows present-day methods and has definite ideas concerning future development. He is well qualified to compare the past and the present, for his background is that of "the old days." He combines the past experiences and the advanced ideas into an able solution of present-day problems. Thus works Mr. Vaughn.

S. L. VAUGHN

Of the various means of approach to the mahogany chair which every dramatist attributes to every executive, Mr. Vaughn chose telegraphy. He learned it while working as baggage man and tie inspector for the Chicago & West Michigan Railroad, and learned it, he says, during his leisure hours. Not only this knowledge of telegraphy but his tenacity and ability put him in the successive positions of telegraph operator at Fremont, agent at Holton, agent at Fremont and commercial agent of the Barryline Steamers at Grand Rapids. All this happened between 1884 and 1902. After opening a city office for the company, he was promoted in 1903 to general freight and passenger agent of the company with offices in Chicago. There he remained until 1906, when he joined the Grand Rapids, Grand Haven & Muskegon Railway, as general accountant. In the following year he was appointed traffic manager to look after the increasing passenger and freight business. In February of this year he was elected vice-president, and in June were heaped upon him the added responsibilities attached to the post of general manager.

More Honors and Work for W. P. Strandborg

W. P. Strandborg, Portland, Ore., is again in the public eye. The publicity and advertising man for the Portland Railway, Light & Power Company has just been chosen to head a committee of the Associated Advertising Clubs of the World, which has under consideration plans for organizing a national association of public utility advertising men. Bill, as he is known to the fraternity, was chosen for this post at the recent annual convention of the Advertising Clubs at Milwaukee. The new body, when organized, will become a new department of that association, of which Bill is a vice-president.

Bill Strandborg has a regular job with the Portland Company under President Franklin T. Griffith, but nobody ever seems to have caught Bill working at it. *Watt's Watt* and the other very successful advertising of the Portland Railway, Light & Power Company appear regularly, but Bill, who writes all of it, never seems to have a hand in it, for like as not he will be in Atlantic City today, in Boston tomorrow and in Cleveland a few days later on. He is one of the greatest globe trotters in the world. When he isn't traveling for his own company, he is being sent somewhere as a delegate by the Portland ad men or the Elks or some other body which signifies goodfellowship. Bill just radiates good fellowship. Even his visiting card is in the form of a folder that advertises the Pacific Northwest and invites you out there among the murmuring pines and the hemlocks.

Bill was born in Ohio and usually worms a ticket home out of Mr. Griffith every year. He took Greeley's advice when a young man and went West, serving on many papers on the coast in all the capacities from reporter to editorial writer and managing editor. When Mr. Griffith assumed the reins at Portland he found himself confronted with the problem of bettering the public relations of the company as one of the first things to be done, and to help him in this work he sought out the writer of the kindly, shrewd and whimsical editorials of the Portland *Telegram* as best qualified for the job and found, as one might expect, that they were being written by a jovial little fat man. As the reader must already have guessed, the formal name of this gentleman on the payroll of the *Evening Telegram* was William P. Strandborg.

Friends, Says P. S. Arkwright of Railways and Automobiles

Automobiles and street railways are not enemies—not even friendly enemies—explains Preston S. Arkwright, president of the Georgia Railway & Power Company, Atlanta, Ga., but the mistaken idea that the two are opponents arises because the service of the two is misunderstood. Mr. Arkwright delivered his opinions on the competition between the two means of transportation in an address, called "Friendly Enemies," before the Atlanta Automobile Association in April. The address has more than a momentary interest.

It would be impossible, he points out, for everybody to operate a private machine, even if he were able, for the streets would be so congested that all private vehicles would have to be ordered from the streets. The legitimate uses for the automobile in the transportation field will be in territory where business would not justify the building of rail lines. Mass transportation, however, states Mr. Arkwright is incapable of being furnished by automobiles. Jitneys pay little property tax and nothing to the cost of pavement, operate at will, and are without obligations of any sort. The street railway, on the other hand, is backed by a responsible operating party, provides a safe means of travel, and bears property taxes and paving taxes, though the original reason for this paving tax has long since passed. The expenses of service have increased in greater ratio than gross receipts. Operation of private automobiles, said Mr. Arkwright, cuts receipts of the street railway, and in Atlanta makes the rate of fare at least one cent higher than it would be were there no automobiles. Such operation, he said also, restricts the ability of the railway company to furnish the quantity and quality of service desired. Mr. Arkwright closed with the repeated admonition: "Don't ever let anybody persuade you that the street railroad is the enemy of the automobile, and I hope you never feel that the automobile is the enemy of the street railroad." His remarks have been reprinted in a pamphlet of seventeen pages.

Mr. Ludwig Auditor at York

Samuel Ludwig, who recently succeeded the late J. J. Landers as auditor of the York Railways, York, Pa., has been continuously connected with this company for twenty years. He began as a clerk in the auditing department and worked his way up to the position of chief clerk. His promotion to assistant auditor under Mr. Landers came as a natural result of his careful study of the principles as well as the practice of accounting. So well did he familiarize himself with the duties of the work of the auditing department that his selection to succeed Mr. Landers, and thus head his department, was the natural termination of two decades of endeavor.

C. E. Fahrney has been made vice-president of the Ottumwa Railway & Light Company, Ottumwa, Iowa. He is also general manager of the company.

C. H. Wales is now electrical engineer of the Olean, Bradford & Salamanca Railway, Olean, N. Y. W. J. Woodcock has been appointed superintendent of power station and S. W. Hardin superintendent of overhead construction.

James E. Lamb has resigned as assistant chief of the bureau of accounts and statistics of the Public Service Commission of Pennsylvania and is now practicing as a certified public accountant as a member of the firm Busher, Lamb & Company, Harrisburg, Pa.

H. R. Roudebush, who has been auditor for the Toledo & Western Railroad, Toledo, Ohio, has been appointed secretary and treasurer of the Community Traction Company, Toledo. David A. Moore was formerly secretary and treasurer. He resigned to engage in private business.

J. I. Mange has been elected president of the Southern New York Power & Railway Corporation, Cooperstown, N. Y. He is president also of the St. Johns Electric Company, St. Augustine, Fla., and a vice-president of the J. G. White Management Corporation and the Eastern Pennsylvania Railways.

F. D. Shoemaker, who for the last three and a half years has been in the service of the Illinois Traction System at the general shops of the company at Decatur, Ill., has resigned, effective July 15, to assume the position of staff engineer of the Texas Company, Railway Division, with headquarters at Chicago, Ill. Before going to I. T. S. Mr. Shoemaker was connected with the old Fort Wayne & Wabash Valley Traction Company and the Fort Wayne & Northern Indiana Traction Company, at Fort Wayne and La Fayette, Ind., respectively.

Charles H. Hubbell, Cleveland Ohio, has announced himself as a candidate for Lieutenant Governor of Ohio at the Democratic primaries on Aug. 8. Mr. Hubbell, now at the head of Charles H. Hubbell & Company, certified public accountants, is well known among utility men, particularly in the Central West. He was formerly secretary of the Texas Power & Light Company and auditor of the Illinois Traction Company. He is against trading stamps, cigar coupons, etc., and says they should be legislated out of existence. Instead of being "liberalized" the provisions of the Volstead act and other prohibition laws, says Mr. Hubbell, should be made more stringent. It is his idea that the State Utilities Commission should not be permitted to allow any utility company a value for rate-making purposes in excess of the amount for which its property appears on the tax duplicate. Moreover, he says that municipal bonds issued for the construction or acquisition of public utilities should be a lien only on such utilities.

Obituary

Lefferts S. Hoffman, general attorney for the Public Service Railway, Newark, N. J., died in May. He was attorney for the Rhode Island Company for some time, and was connected with the United States Rubber Company also, in a legal capacity.

John W. Williamson, assistant superintendent of transportation for the Ohio Valley Electric Railway, Huntington, W. Va., died at his home in Huntington. Mr. Williamson joined the Baltimore & Ohio Railroad in 1893, and later became general freight agent of the Ohio Valley Electric Railway. He was appointed assistant superintendent of transportation in 1918. He was fifty years old.

William Reiser, treasurer of the Electric Bond & Share Company, died recently near Port Jervis, N. Y., while on an automobile trip with his family. He was born in New York City, March 9, 1881. He joined the Electric Bond & Share Company in 1909 and was elected treasurer in 1919. In addition, he was treasurer or assistant treasurer of the companies associated with the Electric Bond & Share Company.

Harvey D. Loveland, member of the California State Railroad Commission, died on June 11 in San Francisco after several weeks illness. Col. Loveland was credited in railroad commission circles with being the dean of public utility commissioners in the United States in point of service. He was first appointed to the California commission in 1907 by Governor Gillett and at once established himself as an authority on transportation problems. He was elected to the commission in November, 1910, and upon the reorganization of that body in 1911 became, under the public utilities act, one of its five members. He was again appointed at the expiration of his term and was reappointed on two occasions thereafter. His present term of six years began Jan. 1, 1921.

M. F. Flatley, master mechanic of the Lackawanna & Wyoming Valley Railroad, Scranton, Pa., died a short time ago. He previously had been master mechanic of the Dayton & Troy Electric Railway and from 1915 to 1917 of the Lebanon shops of the Terre Haute, Indianapolis & Eastern Traction Company. He was associated with the Westinghouse Electric & Manufacturing Company early in his career, and later with the Interborough Rapid Transit Company, New York, as foreman of car equipment of the elevated division. He was foreman of the elevated division of the Brooklyn Rapid Transit Company for four and one-half years. In 1909 he became master mechanic of the Rochester, Syracuse & Eastern Railway, Syracuse, N. Y., joining the Indianapolis Traction Company in 1915.

DISCUSSIONS OF MARKET AND TRADE CONDITIONS FOR THE MANUFACTURER, SALESMAN AND PURCHASING AGENT

ROLLING STOCK PURCHASES BUSINESS ANNOUNCEMENTS

Early Electrification of Bombay Railways

Information from the Vice-Consul at Bombay, India, states that the proposed electrification of the Bombay steam railroads will be started immediately and will involve the eventual expenditure of 40,000,000 rupees, all the work to be completed by 1927.

The first step in the project will be the electrification of the Harbor branch of the Great Indian Peninsula Railway. Messrs. Merz and McLellan of London are the consulting engineers in this work. The local chief engineer left a short time ago for England with the complete plans. The requests for bids, it is understood, will be made as soon after his arrival in England as they can be prepared.

The Harbor branch, recently completed, connects Victoria Terminus with the Port Trust Railroad and rejoins the main line of the Great Indian Peninsula Railroad at Kurla, which is located on the southern end of the Island of Salsette, about a mile from the extreme northern end of the Island of Bombay. The branch is about 7 miles long. It is double-tracked as far as Sewri (about half way) and single-tracked from there to Kurla. No equipment has yet been bought for this branch; but it is understood that electric equipment will now be purchased.

The Tata Hydro-electric Power Company will furnish all the power. The total hourly maximum demand on the Harbor branch will be 2,500 kw. No new transmission lines will be necessary, the power being supplied from existing substations.

It is planned to start work on the electrification of the first part within six months. It is to be completed in 1924. The acting consulting engineer has estimated that the Harbor branch is about one-thirteenth the size of the whole project.

The second step will be the electrification of the main line of the G. I. P. Railroad from Victoria Terminus to Kurla. This line now has two tracks and two more are in process of construction as far as Kurla.

This second step will take a total hourly maximum demand of 6,650 kw., which will be provided by two substations of 3,500 kw. each. Bids will be advertised for in about six months.

A third stage will be Kurla to Thana, 14 miles; this will require an additional 3,500 kw. The final stage is from Thana to Kalyan, the extreme limit to which steam suburban lines run now. Kaylan is 34 miles from Bombay. This extension will require 2,000 kw. additional power.

Meanwhile, the Bombay, Baroda & Central India—a two-track line—is to electrify its suburban lines from Colaba Station to Virar, a distance of 38½ miles. This will complete the electrification of the steam railroad lines for suburban traffic. No decision has been reached on the Port Trust Railroad electrification.

It is understood that the government of India will provide the necessary funds, the Viceroy having guaranteed them at a conference with the railroad agents, the consulting engineer, the governor of Bombay, and the financial secretary. It is known that two offers to supply the capital were made by English banks, but it is believed that an effort will be made to raise all of it in India.

$100,000 to Be Spent in Rehabilitation Work

Approximately $100,000 will be spent in the rehabilitation of the Cincinnati, Georgetown & Portsmouth Railroad and its branch the Felicity & Bethel Railway, when the road is taken over by an organized syndicate. L. G. Van Ness, who is the general manager of the Cincinnati, Lawrenceburg & Aurora Electric Street Railroad, has announced that new equipment will be purchased, including cars, rails and overhead wires. Several new substations will also be added at various points along the line to provide the necessary power supply.

Thirty-four Locomotives for Japan

The Imperial Government Railways of Japan has just placed with the English Electric Company for its Dick Kerr Works at Preston an order for thirty-four complete electric locomotives of the total value of upward of £500,000. This represents the whole requirement of locomotives up to the end of 1923 for those sections of the main line railways which the Japanese Government has decided to electrify at once.

Eight of the locomotives now ordered are for heavy express passenger service. They are of the 2-C-C-2 type. Their weight is approximately 96 tons and they are designed to haul a 415-ton train at a balancing speed of about 60 m.p.h. Each locomotive is equipped with six D. K. 86A motors rated at 306 hp. at 500 volts, the motors being connected in two groups of three in permanent series on a trolley voltage of 1,500 volts. The control equipment is of the standard "English electric" cam-shaft muliple-unit type.

Of the remaining locomotives, nine are for local passenger service and seventeen are for heavy freight service. These twenty-six are all of the B-B type and will weigh approximately 56 tons each. They are equipped with four D. K. 86A motors similar to those on the express passenger locomotives, but in this case the motors will be connected in two pairs in permanent series. Here too the control is the standard "English electric" multiple-unit type. The locomotives for local passenger service are designed to haul a 315-ton train and the freight locomotive a 600-ton train, the balancing speeds being about 55 and 40 m.p.h. respectively.

Short Delivery for Interborough Cars

As announced in these columns in the issue of May 6 the Transit Commission of New York directed the Interborough to order 350 new cars, 100 of them immediately. The company obtained bids at once and has now placed an order with the Pullman Company for 100 new trailer cars, which will provide 5,000 additional seats and help relieve existing congestion.

The bid of the Pullman Company covers car bodies and trucks. The wiring and other installation will be made at the company's shops at 148th Street and Lenox Avenue, to which the commission recently authorized additions of a temporary character to facilitate the equipment work. It is expected that the delivery of car bodies and trucks will begin in November at the rate of five a day and that delivery will be completed in December. If this schedule can be adhered to, the cars, which will be in the shops about three weeks, will all be in service by Christmas.

It is estimated that the new cars will cost the Interborough between $1,875,000 and $2,000,000. A part of the expense will be met out of existing funds of the company and the rest will be met by the issuance of $1,400,000 of car trust certificates, designated as "Interborough Equipment Trust Series A," and bearing interest at the rate of 6 per cent, a plan that has received the approval of the commission. The cost of each car when fully equipped is estimated at between $18,000 and $20,000.

Metal, Coal and Material Prices

Metals—New York	July 11, 1922
Copper, electrolytic, cents per lb	13.937
Copper wire base, cents per lb	15.75
Lead, cents per lb	5.75
Zinc, cents per lb	5.72
Tin, Straits, cents per lb	31.25
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$6.32
Somerset mine run, Boston, net tons	3.62
Pittsburgh, mine run, Pittsburgh, net tons	....
Franklin, Ill., screenings, Chicago, net tons	....
Central, Ill., screenings, Chicago, net tons	....
Kansas screenings, Kansas City, net tons	3.30
Materials	
Rubber-covered wire, N. Y., cents per lb	6.25
Weatherproof wire base, N. Y., cents per lb.	15.50
Cement, Chicago net prices, without bags	$2.05
Linseed oil, (5-bbl. lots), N. Y., cents per gal.	91.50
White lead, (100-lb. keg), N. Y., cents per lb.	12.50
Turpentine (bbl. lots), N.Y., per gal	$1.22

Chicago Testing Fare Boxes

The Chicago Surface Lines is contemplating the installation of Johnson fare boxes on all cars. A trial installation of fifteen motor-driven boxes has been made and a study of their operation and the results obtained is going on. The change in fare to 7 cents with a lower ticket rate has precipitated a more prompt consideration of the purchase of boxes. Hand-operated boxes may be installed to begin with and later be replaced with motor-driven boxes. The company will also substitute metal tokens for the paper tickets now in use.

Development Work Involves Millions of Dollars

Cities Service Company recently announced its approval of plans involving the expenditure of several millions of dollars on the properties of the Ohio Public Service Company, a subsidiary serving the northeastern section of Ohio. The plans approved call for the construction of a 60-mile 130,000-volt steel tower transmission line from Lorain to Mansfield, Ohio, a similar line 55 miles long between Warren, Alliance and Canton, where it will tie in with the system of the American Gas & Electric Company, which now operates a large power plant on the Ohio River.

In addition, the plans provided call for the installation of a 20,000-kw. turbine at the Edgewater plant at Lorain, Ohio, and a new 30,000-kw. turbine in the Toledo Edison Company plant in Toledo. This development work when completed on the Ohio properties at Mansfield, Massillon, Elyria, Lorain and Alliance will make available for service generating capacity now held in reserve in the individual plants. A new 10,000-kw. turbo-generator has been authorized for the Empire District Electric Company in Joplin, Mo., together with other equipment for subsidiary utility properties of Cities Service Company which involves an expenditure of an additional $1,000,000.

$32,500 to Be Spent in Railway Department

The 1922 construction program of the Columbus Electric & Power Company, Columbus, Ga., announced several weeks ago by R. M. Harding, manager, includes the sum of $32,500 to be expended in the electric railway department. Carhouse improvements total $1,500; purchase of three new street cars $20,000 and miscellaneous track work amounts to $11,000.

Great Northern to Electrify

The Great Northern Railway is planning to electrify its system in the Rocky Mountain States, according to reports in the financial district this week. The Spokane region is to be developed first. The work is expected to start about 1924.

Rolling Stock

Western Ohio Railway, Lima, Ohio, will have its new steel cars which were ordered recently delivered by July 20.

Chicago, Aurora & Elgin Railroad, Aurora, Ill., will shortly place an order for twenty new combination parlor and dining cars.

Department of Street Railways, Detroit, Mich., will open bids July 24 for 100 new cars of the Peter Witt type, 100 pairs of trucks and the necessary electrical equipment for their operation.

Kansas City (Mo.) Railways has been authorized through its receivers to purchase the twenty large type cars under an order filed in Federal Court signed by Judge Kimbrough Stone and Judge Arba S. Van Valkenburgh. The application was made several weeks ago.

Dallas (Tex.) Railway has purchased five one-man cars with two express cars for installation on the Dallas-Terrell interurban line. The cars were constructed by the American Car Company. These one-man interurbans will be the first to appear in the south or southwest.

Jacksonville (Fla.) Traction Company has announced through its manager, J. P. Ingle, that three of the one-man cars had arrived. These cars will take the place of the two-men cars on one of the lines serving the greatest number of people in the city. In all twelve cars have been ordered to be ready for operation the latter part of August.

The Reading Transit & Light Company, Reading, Pa., has secured equipment of sign frames for advertising use on the outside of the cars. The frames, attractive in appearance and made of metal, were finished in the shops of the company at Reading and are of uniform size and color to harmonize with the exterior finish of the cars. Posters are placed in the frames to inform the public along all city and suburban lines of attractions at various places reached by the cars. At present they are used especially for Carsonia Park, where the advertising of free band concerts, dancing, baseball and other diversions has been followed by a large volume of business since the opening of the outdoor amusement season.

Track and Roadway

Olean, Bradford and Salamanca Railway, Bradford, Pa., will start the repairing of pavements along its tracks in all parts of the city.

The Tiffin, Fostoria & Eastern Electric Railway, Tiffin, Ohio, will tear up its street car tracks the entire length of South Washington Street before next April.

The Winona Interurban Railway, Warsaw, Ind., expects to place a contract within the next two weeks for necessary tracks and switches for connecting with the Wabash Railroad at New Paris, Ind.

Chattanooga (Tenn.) Traction Company is planning the extension of its lines which will join the Red Bank and Signal Mountain lines. Making the connection will include the laying of about 2½ miles of track. The investment will amount to approximately $60,000.

Milwaukee Electric Railway & Light Company, Milwaukee, Wis., is engaged in the rebuilding of the track intersection at West Water and Grand Avenues. An entire new intersection will be put in, including a double-track curve at the Caswell Block corner and the removal of the single-track curve at the Gimbel corner. This work will cost about $46,000 and will take one month to complete.

British Columbia Electric Railway, Vancouver, B. C., is relaying 1,000 ft. of track with the paving of a section of Wilson Road, Kerrisdale. This work will cost $16,000. Work has been started on the double-track Broadway west extension of 1 mile from Trafalgar Street to Alma Road. The track will cost $75,000, of which $50,000 will be spent on local labor and materials.

Indianapolis (Ind.) Street Railway has been ordered to extend city street car service to the city limits in College Avenue by the Board of Public Works. Officers of the company pointed out that the company did not own the tracks in College Avenue north of the terminal of present service. The works board in ordering the extension offered no suggestions on means to be employed by the company in acquiring the use of tracks north of that point, which now belong to the Union Traction Company.

San Diego (Cal.) Electric Railway started work on May 22 on the reconstruction of its Logan Avenue line. The reconstruction will include 3.9 single-track miles. The replacement is with 114-lb. girder rails with special track-work of the same type and weight. 100-lb. T-rails and 75-lb. A.S.C.E. rails will also be used. All will be laid on twin steel ties spaced 5 ft. 6 in. center to center. All joints are to be welded except on the special track-work. The estimated cost of the reconstruction is $268,000.

International Railway, Buffalo, N. Y., was to start on June 10 the construction of double trackage in Bailey Avenue for a distance of 8,000 ft. Bailey Avenue at this point at present has but a single track and the work, which is estimated to cost about $110,000 and to take two months to complete will include reconstruction of the present single track and the construction of an additional track, making a double trackage for this distance. H. E. Riexinger is the chief engineer in charge of the project. The work will be done by day labor.

The Connecticut Company, New Haven, Conn., is planning to double-track the line on Main Street, in Manchester, from the center, south to Locust Street, a distance of some 1,500 ft. The company is asked to provide ten-minute service on this line and is unable to do so with a single track. Business interests of the town feel that the entire street should be double-tracked. N. J. Scott, Manager, of the Hartford Division, has expressed himself in favor of such a plan, but states that it is a matter of expense with his company.

British Columbia Electric Railway, Vancouver, B. C., started work on June 5 on a one-mile double track extension of its Broadway West line. The cost will be about $75,000. Depending upon the consent of the city, permanent track will be laid, 87 lb. rail being used. The new line will provide transportation for a large district and afford a new route for two suburban lines to come into the city, relieving a parallel line. The line is to be in operation by Sept. 1. The construction of this line follows an agreement with the city of Vancouver extending the present 6-cent fare after June 30 when it would have expired. The company is also relaying 1,000 ft. of track on its Kerrisdale line with permanent construction at a cost of $16,000.

Power Houses Shops and Buildings

Tampa (Fla.) Electric Company has purchased a 600 hp. B. & W. boiler.

Trenton & Mercer County Traction Company, Trenton, N. J., will purchase soot blowers.

Shreveport (La.) Railways will build a new carhouse and repair pits to shelter twenty cars.

Texas Electric Railway, Dallas, Tex., has purchased a 400-ton hydraulic wheel press from the Chambersberg Engineering Company of Philadelphia, to supplement a Caldwell press which will be used for lighter work.

Olean, Bradford & Salamanca Railway, Olean, N. Y., expects to build in the near future a brick and steel sash general warehouse and storage building. The company will also purchase equipment for handling hard coal to and from bunker storage for car heaters.

Chicago, Aurora & Elgin Railroad, Aurora, Ill., has been authorized to construct a new freight house to be located on North Broadway. Extensions to the Wheaton carhouse and extensive improvements to the company's power plant are also included in the reorganization plan.

Cumberland County Power & Light Company, Augusta, Me., is planning to spend $1,000,000 for the construction of a new steam station at South Portland and has petitioned the Public Utilities Commission for permission to issue and sell $1,000,000 of its first and refunding mortgage 5 per cent gold bonds for that purpose. This will cover cost of the site, construction and cable connections with the company's existing lines.

Trade Notes

Westinghouse International Company announces that due to its increased business in Argentine it has been necessary to move into larger offices. The new address of the company is Cia. Westinghouse Electric Internacional, S. A., Avenida de Mayo, 1031, Buenos Aires, Argentina. Louis T. Peck is managing director of this branch.

Isidore Newman & Son have announced that the business heretofore conducted by them was incorporated July 1, 1922, and will be continued under the name of Newman, Saunders & Company, Inc. The offices are located at 212 Carondelet Street, New Orleans, La. The firm has long been associated with the financing of utility properties in the South.

Economy Fuse & Manufacturing Company, Chicago, Ill., announces the appointment of Charles H. Bluske as district sales manager of the Los Angeles office at 1304 Maltman Avenue. Mr. Bluske was formerly connected with the Pacific States Electric Company of Los Angeles and succeeds George L. Davis. The Pittsburgh Sales Office of the Economy Fuse & Manufacturing Company has been moved from 2223 Farmers Bank Building to 1006 People's Bank Building, at Fourth Avenue and Wood Street.

National Railway Appliance Company, New York, N. Y., announces that Joseph H. Towle, who joined the selling force of the company some time ago, is now located at Harrisburg, Pa. The company has established an office there to be the Pennsylvania headquarters. Mr. Towle is probably best known to many as master mechanic of the Dayton and Springfield, Ohio, properties of the American Railways. He was later connected with the Railway Improvement Company of New York as sales engineer.

The Barney & Smith Car Company's plant at Dayton, Ohio, which at one time was the largest concern of its kind in the country, will be offered for sale on July 12, according to a court ruling made recently. The plant will be put up at auction by Sheriff Cusick of Montgomery County in compliance with a court order issued in foreclosure of a mortgage held by the stockholders. Valentine Winters, receiver, has announced an organization of Dayton business men will bid on the property.

The Differential Steel Car Company, Findlay, Ohio, reports delivery of eight Differential cars to the Toronto Transportation Commission and a two-car Differential train to the Texas Construction Company. Recent orders for Differential cars include two for the United Electric Railways of Providence, R. I., four for the New Orleans Railway & Light Company, six for the Cleveland Railway Company, two for the Pittsburgh Railways Company. A train of three Differential cars consisting of a motor car and two trail cars has also been ordered by the Community Traction Company, Toledo, Ohio, and the Milwaukee Electric Railway & Light Company has ordered ten Differential cars of the trail type to supplement the equipment they already have in service.

New Advertising Literature

Lourie Manufacturing Company, Springfield, Ill., has issued a leaflet illustrating many of the types of special machines which the company has designed and manufactured for electric railway use.

Joseph Dixon Crucible Company, Jersey City, N. J., has issued a booklet dealing with automobile lubricants. The reasons for the success of Dixon's products are given, and arguments why they should be used in transmissions and differentials.

Martindale Electric Company, Cleveland, Ohio, has issued a folder relating to commutator grinding and undercutting. A card has also been issued giving a scale along the left-hand edge with data regarding commutator troubles, their cause, effect and remedy. Directions for ordering and use of the Imperial commutator stones are given.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has just issued a leaflet entitled "Arc Welding in Electric Railway Shops." The publication describes advantages of arc welding and gives figures showing savings possible by reclaiming railway parts, such as worn and broken brake shoes, side bearings, truck frames, bolsters, door castings, gear cases, air reservoirs, etc.

Carnegie Steel Company, Pittsburgh, Pa., has just issued new editions of its booklets on "Wrought Steel Wheels" and "Industrial Wheels, Gear Blanks and Other Circular Forgings." These booklets give much information of value to electric railways. Dimensions of various types of steel wheels are given, together with tread and flange contours. Standard specifications are also included for solid rolled carbon steel wheels for electric railway service as adopted by the American Society for Testing Materials. The booklet on gear blanks and circular forgings gives dimensions for these parts.

The Conveyors Corporation of America, Chicago, Ill., has issued a new booklet describing its American cast-iron storage tank, which is designed for holding loose, bulky, dry materials for storage or transfer. The tank is sectional and may be secured in a number of sizes. The booklet is illustrated with engravings showing the tanks in use at a number of well-known plants. Diagrams give details of construction and a comprehensive table of weights and measures is included. Copies of the booklet may be secured by addressing the Conveyors Corporation at 326 West Madison Street, Chicago, or on application to the district representatives.

The Child Is Father to the Man

THE greatest need in the safety crusade now being carried on over the country is the education of every one in the adoption of the safety habit. This lesson can best be learned in childhood, because impressions gained in tender years remain more vivid than those received later on in life.

One of the very encouraging results that the various safety campaigns are showing is the appreciation by many of our Educational Boards of the need for teaching safety in the schools. This is particularly satisfactory because the educational authorities are constantly being urged to include various fads and fancies in the school curricula to the detriment of the amount of time and energy that could otherwise be given to fundamental studies. The safety habit, however, is on a different basis. If it is good for an adult, as all admit, it is even more necessary for children.

The pioneer work done in St. Louis and other schools, through the efforts of Dr. E. George Paine, former principal of the Harris Teachers' College, St. Louis, Mo., and others, has been bearing fruit, and one of the things that is most hopeful in connection with the whole question of safety is this extending attention to safety in the schools. Here is a potential field of great opportunity for managers and operators of electric railway properties, i.e., so to develop their safety campaigns that this instruction will be continued and extended.

Now Is a Good Time to Start a Safety Organization

THE report of the committee on safety, presented last year at the convention of the Transportation & Traffic Association, showed that out of the 131 companies reporting, 50 per cent are spending nothing on safety work, and that the other 50 per cent average only $2,002 per company per year. Only thirty-nine companies reported that they had departmental safety committees, while eighty-six said they had none. In other ways the report of the committee showed that much more could be done to advantage in the way of safety by many companies.

To some extent this can be understood, in spite of the fact that organized safety was introduced on electric railway properties as far back as 1913 and 1914. During the years of the war the railways were handicapped in efforts to carry out campaigns of this kind because of the shortage of labor, the inexperience of many of the new men who were hired and the various war campaigns which were of paramount importance.

Conditions are ripe now, however, for active safety work. Experience gained during the war has taught the effectiveness of co-operative public campaigns to secure a definite community object. A great deal has been learned also as to the best way of organizing for such an object through departmental and other committees and the need for a permanent organization if continuous rather than spasmodic results are to be obtained. Finally, the train force has become a more permanent body than for a number of years past. This may be due to the increasing use of one-man cars, which call for the employment of men capable of earning higher pay. But if these higher grade men, by the exercise of more skill in operation, can cut down the accident cost, the companies can well afford to pay higher wages.

This issue should be of help to those companies planning safety organizations as it gives accounts of methods which have proved successful on many properties.

Organized Safety Work Is the Price of Accident Reduction

THERE is a maxim that self-preservation is the first law of nature, and the courts recognize "self-defense" as an excuse even for homicide. Theoretically, the idea of safety first should be so ingrained in human consciousness that it would not have to be taught in the schools and elsewhere. Actually it is about as hard to get the average man to take precautions against accidents to himself as it is to make him do a great many other things which he ought to do but which he omits because they take a little time or energy.

The electric railway has more interest in the general adoption of safety measures than any other corporation in the community. This is because of the very large accident hazard on the streets. In fact, the public hazard of the electric railway company is probably greater than that of any other interest in each community, though its legal hazard is not identical with its public hazard. But even if there were no legal hazard, the humanitarian doctrine would urge electric railway companies to take a lead in public safety activities.

The idea of general public safety campaigns is comparatively a modern one. It is hard to say who initiated it, but in electric railway circles undoubtedly the honor belongs to the claims department. This department also usually has accepted the responsibility of maintaining interest in the safety campaigns. Undoubtedly it has taken this leading part because the claims representatives are in a particularly good position to see both the expense and the suffering which follow casualties.

The assignment of the claims department primarily to this work on any electric railway is a logical course. Real success, however, must come from co-operative efforts not only from every department but from every one connected with each of the departments. On every employee there rests a certain degree of responsibility, and especially on the executive, because without his encouragement and approval interest will lag and die.

At one time the railways thought they had to do practically all the safety campaign work in a community. This need not be so and should not be so in any progressive city. For this condition the National Safety Council deserves most credit. Through it or one of its subdivisions the forces of the community can be co-ordinated in accident prevention. If the railway company should attempt to conduct a campaign by itself, it might be charged with a purely selfish motive. With the work under the general direction of a community board, the railway company can contribute as much as it is able to the safety movement, yet not be accused of raising humanitarian issues to save money.

The two most fruitful opportunities for the reduction of accidents on the streets are through the school children and the trainmen. Adults are supposed to have learned by experience how to take care of themselves, and if they have not, they have no one to blame but themselves. But without this experience and being naturally impetuous, children are liable to incur all sorts of danger, where there are risks to be run. If safety can be taught as second nature during the school days the lesson will last a lifetime. With the trainmen also safety should be acquired as a habit. After all, it is only taking thought and care, and adults can learn to do this as easily as any one else. That work along these lines is effective and has reduced accidents has now been so clearly proved on many properties as to admit of no doubt.

As in every worth-while result, however, success cannot be obtained simply by wishing for it. This means that careful planning, hard work and persistence are necessary. Fortunately, experience is accumulating in accident prevention work, so that less experimentation is necessary than was once the case. Hard work is a matter in which every one should share, from the executive down. Persistence is largely a matter of organization and individual responsibility. It can best be obtained when the maintenance of this interest is the duty and the principal duty of one or more individuals, called, possibly, safety engineer or engineers.

The qualifications of such a man are laid down in this issue by two of the contributors. According to these specifications, a first-class all-around man is required. But the rewards, certainly in service to his fellows, are great. This is one of the positions on an electric railway which has been created by modern times and should grow in importance.

It is worthy of note that safety engineering for electric railways came into being about the time that automobile traffic began to crowd our city streets. This may be a coincidence or it may be simply an illustration of cause and effect. At any rate, the hazards created by automobile traffic have greatly increased the difficulties of safe operation by electric cars. The danger from careless habits becomes multiplied many times when an individual changes from a pedestrian on the street to the driver of a car. He then not only imperils his own life and limbs by carelessness also but those of many others.

Much of this increased hazard responsibility falls on the street railway company, but it is also shared by every user of the street. This is an added reason for safety measures at this time. Nevertheless, statistics from a number of companies have shown that in spite of the increased automobile traffic of the present day, accidents with good safety organization are fewer than before the automobile era.

Recent Car Design Has Been Along Safety Lines

IT IS notable that the most conspicuous developments in car design within recent years have been in the direction of safety. The inventor and car designer have been working with the same objects in view as the operating manager. Unfortunately passengers will insist on taking chances if allowed to do so and many if not most of these recent inventions relate to ways of preventing passengers from injuring themselves.

These changes in design and practice have gone so far in some cases as to cause complete retirement of designs. For example, for many years the open type of car with side running board was very popular with the traveling public, but the number of boarding and alighting accidents was so great that railways could not afford to continue the use of this type of car in service. Hence, no new open cars with side running boards have been built for a number of years, and many of those formerly in existence have been converted to the type of open car with center aisle.

Boarding and alighting accidents have also been greatly reduced through the vestibuling of cars and the use of folding doors and steps, together with the addition of safety devices, which provide for more efficient braking and the interlocking of the door and step operation with that of the control and brakes. Comparative records made on the same system with the same class of average city service showed that in a period of nine months on 130 cars equipped with folding steps and air-operated doors there were less than forty accidents. During the same period on 700 city cars not equipped with folding doors and steps there were 687 boarding and alighting accidents while the cars were standing and 253 accidents while the cars were moving. The comparison in this case is one accident for every thirty-two cars equipped with folding steps and air-operated doors as against 1.3 accidents for every car not equipped with folding doors and steps.

A reduction in the number of accidents occurring while the cars are moving can be materially cut down through the interlocking of the door and step operation with that of the control so as to make it impossible to start the car until the doors are closed and the steps folded.

A few years ago only the heavier type of city cars were equipped with air brakes. Now we find comparatively light city cars with air brake equipment. There is no doubt that this has also been a considerable factor in reducing accidents. The use on cars of safety devices such as the dead man type of control with emergency features of braking received considerable impetus through its application and general use on safety cars. Many of the features which were brought out primarily for this type of car have now been extended to heavier types, with great success.

Great advances have been made in the development of door engines. In the first types which were installed about twenty years ago there was a source of danger through the building up of air pressure whenever the door would bind or meet an obstruction, which would then cause the door to close with such force as to be a menace to anything in its path. Late types of engines can now be adjusted to maintain an even pressure over the entire length of the door closing and the use of collapsible shoes and other interlocking devices makes it almost impossible to have a door accident through the use of automatically operated doors.

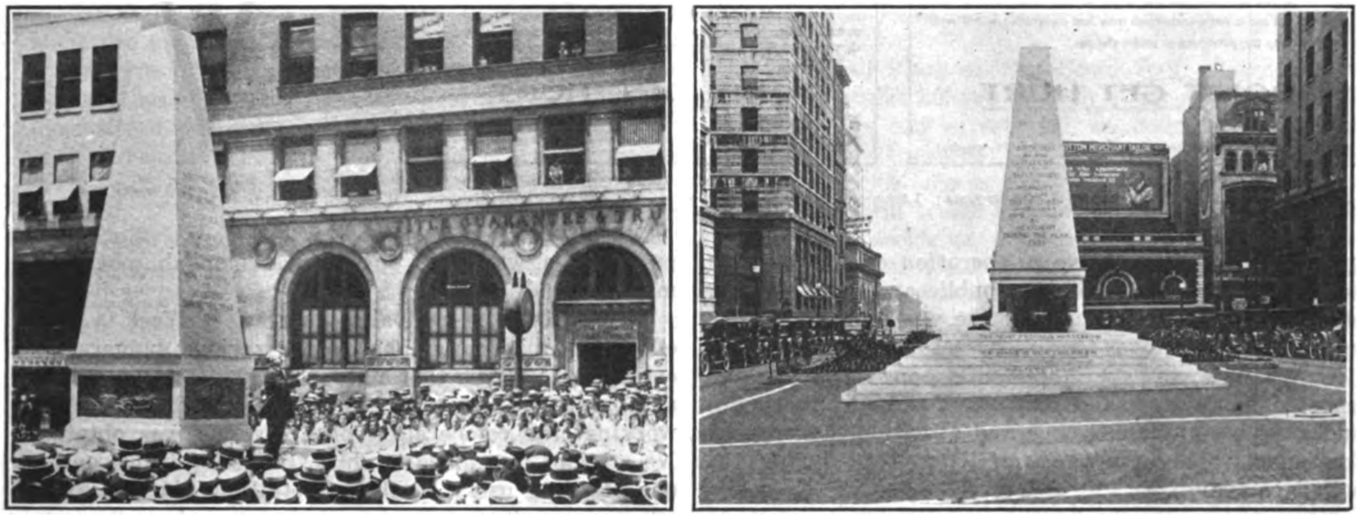
How Safety Week Was Conducted in Baltimore

Under the Direction of the Merchants' and Manufacturers' Association, All Interests in the City Participated in a No-Accident Week Last Month—The Street Railways Took an Active Part

By L. H. Palmer
President American Electric Railway Transportation & Traffic Association
Assistant to President United Railways & Electric Company of Baltimore

THE continued increase in the use of the streets in Baltimore, Md., with consequent piling up of congestion, particularly in the business district, has resulted, as in other cities, in an increased number of public accidents; that is, those occurring on the streets and sidewalks of the city. These accidents come under the general category covered by public accidents as distinguished from those occurring in industrial plants, individual homes and places not specifically under the supervision of the public authorities.

In 1921 the press of Baltimore agitated the question of increased safety in the streets, and as a result of its efforts, particularly those of the *Evening Sun*, a "No-Accident Week" campaign was planned and put under way to cover the entire State. After considerable preparation this was carried out during the month of July and resulted in an appreciable decrease in the number of accidents, and as well aroused the citizens to the need for use of greater precautions.



A Monument Was Erected on a Prominent Square and Dedicated by the Mayor During No-Accident Week

During the spring of this year the subject was again brought to the front by the increasing number of accidents on the streets, and a representative committee was appointed by the Merchants' and Manufacturers' Association (which corresponds to the Chamber of Commerce in many cities), with the result that a "No-Accident Week" was planned to begin June 11. One of the compelling reasons for choosing this June week was to get the movement under way while the schools were still in session. It was decided to lay great stress upon the need of educating the children, particularly the younger ones, in accident prevention.

Representatives of the various organizations and industries of the city were included on this committee, and every one approached was glad to take part in the work, because all realized the need for spreading the doctrine of safety.

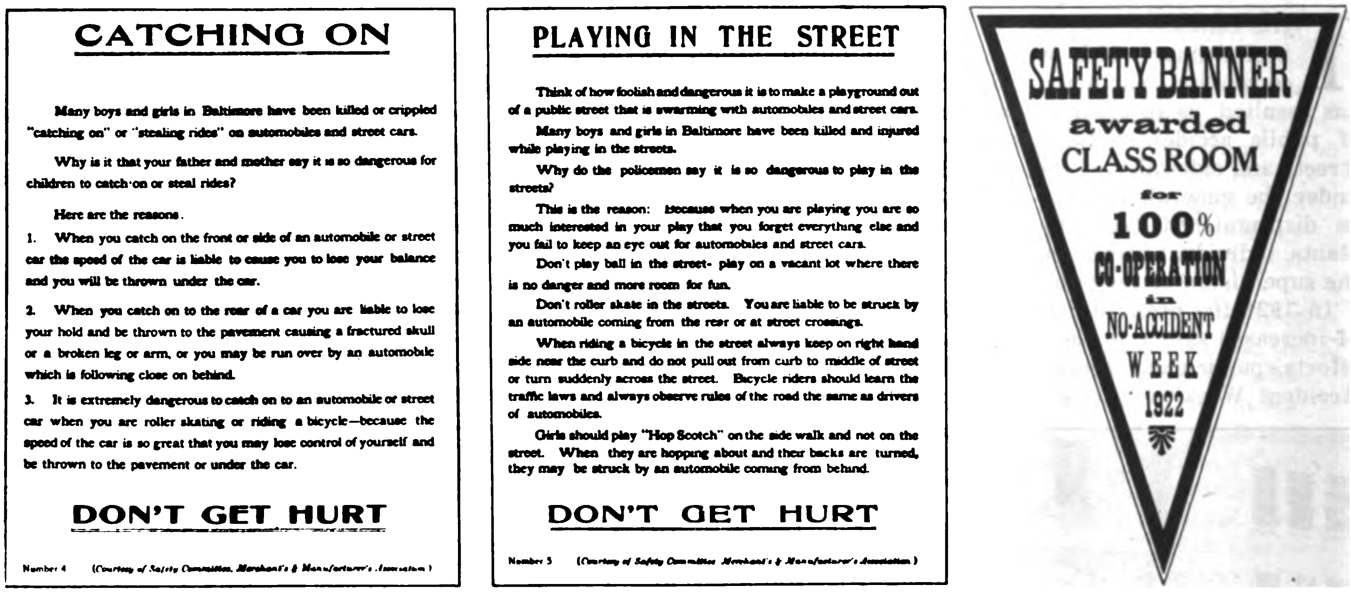
The whole movement was practically assured of success in advance because of the active support which it received from the Mayor and the various other officials of the city and their subordinates, and from the Commissioner of Police and all of the officers and uniformed men of his department, who threw themselves heart and soul into the movement.

The Automobile Club, Association of Automobile Dealers, the steam railroads, the street railway company and other large corporate and business interests of the city joined hands in the movement and lent their moral support as well as their active interest in forwarding the campaign.

It was the spirit of whole-hearted, unselfish co-operation on the part of the people, the Mayor, the Commissioner of Police and the Automobile Club that assured the success of the whole effort.

Particular attention was given to the efforts made to get the attention and rivet the interest of the school children. This was made possible by the co-operation of the Board of Education, which distributed a series of safety lessons prepared by the committee. Subjects of these lessons were: Crossing the Street, The Street Car, The Automobile, Catching on or Stealing Rides on Automobiles and Street Cars, and Playing in the Streets. These lessons carried a direct safety message in a way that school children could understand them. Two of them are reproduced on page 110. Teachers were told that the safety of children would be made the outstanding feature of the campaign, and in addition to using the lessons they were asked to appoint a committee of three children in each classroom to act as safety patrols and watch streets when schools were dismissed and warn children observed playing in a dangerous way. Arrangement was made with the school board to have school children write a letter to their parents on what they were doing to prevent accidents during the week and asking them to co-operate. This called for a reply from parents and classrooms receiving 100 per cent replies received a banner, reproduced on this page. To stimulate further interest, the Merchants' and Manufacturers' Association offered several prizes for posters designed by school children on "The Right and Wrong Way to Cross a Street." Prizes were offered for the best essay written by children.

Continuing all during the campaign, too, was the great influence and active co-operation of the press in keeping the matter before the public and in publishing stories and articles which kept the whole question alive and in the public eye.



CATCHING ON

Many boys and girls in Baltimore have been killed or crippled "catching on" or "stealing rides" on automobiles and street cars.

Why is it that your father and mother say it is so dangerous for children to catch-on or steal rides?

Here are the reasons.

1. When you catch on the front or side of an automobile or street car the speed of the car is liable to cause you to lose your balance and you will be thrown under the car.

2. When you catch on to the rear of a car you are liable to lose your hold and be thrown to the pavement causing a fractured skull or a broken leg or arm, or you may be run over by an automobile which is following close on behind.

3. It is extremely dangerous to catch on to an automobile or street car when you are roller skating or riding a bicycle—because the speed of the car is so great that you may lose control of yourself and be thrown to the pavement or under the car.

DON'T GET HURT

PLAYING IN THE STREET

Think of how foolish and dangerous it is to make a playground out of a public street that is swarming with automobiles and street cars.

Many boys and girls in Baltimore have been killed and injured while playing in the streets.

Why do the policemen say it is so dangerous to play in the streets?

This is the reason: Because when you are playing you are so much interested in your play that you forget everything else and you fail to keep an eye out for automobiles and street cars.

Don't play ball in the street- play on a vacant lot where there is no danger and more room for fun.

Don't roller skate in the streets. You are liable to be struck by an automobile coming from the rear or at street crossings.

When riding a bicycle in the street always keep on right hand side near the curb and do not pull out from curb to middle of street or turn suddenly across the street. Bicycle riders should learn the traffic laws and always observe rules of the road the same as drivers of automobiles.

Girls should play "Hop Scotch" on the side walk and not on the street. When they are hopping about and their backs are turned, they may be struck by an automobile coming from behind.

DON'T GET HURT

TWO OF THE FIVE SPECIAL LESSONS SENT TO THE SCHOOLS BY THE COMMITTEE—BANNER AWARDED TO CLASSES FOR 100 PER CENT CO-OPERATION

C. W. Price, an experienced safety engineer, who had assisted in the campaign last year, came to Baltimore and gave his undivided time and attention to the work for some weeks in advance of as well as during the actual campaign.

Each day in the week was especially designated, as shown in the official program, a part of which is reproduced on the opposite page.

The United Railways & Electric Company gave freely of the time and energies of its staff to the campaign. It provided and operated flat cars, made into floats, carrying object lessons as to the results of carelessness. These cars were operated all around the system preceded by a car with a band, to call the attention of the people on the streets and in neighboring buildings to the float and its object lesson. A picture of one of the floats showing a hospital scene is given. Another float depicted the results of an automobile collision and still another the effect of the right and the wrong way to play. A B. & O. engine modeled in wood, showing a demolished auto and gates at grade crossing, was made by B. & O. employees and was paraded around on Railroad Crossing Day.

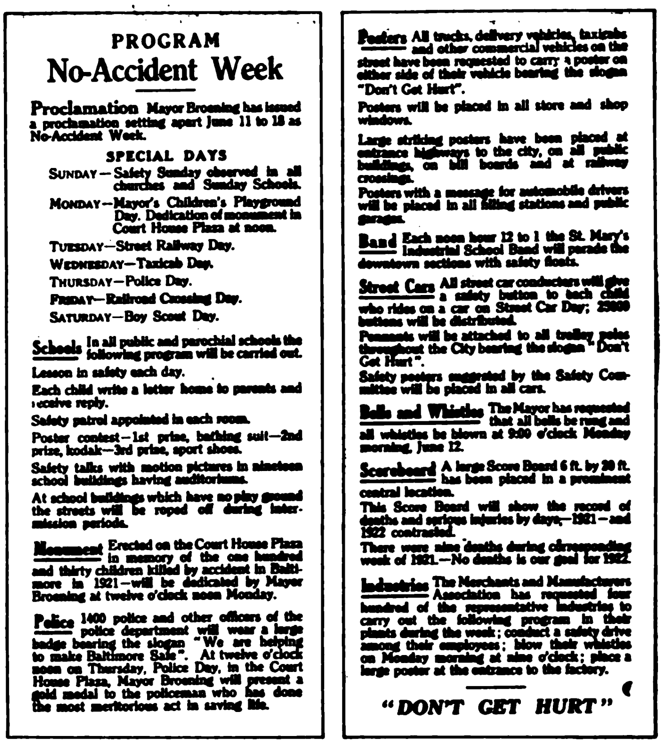
Every car on the system had stenciled on the bumper, front and rear, the slogan of the campaign, "Don't Get Hurt." Each trolley pole of every car carried a banner on which appeared these same words.

On Street Railway Day 25,000 buttons were distributed to children by conductors on the street cars. Every child who got on a car that day, as fare was paid, received a red and white button with the phrase on it, "We are helping make Baltimore safe." Special instructions were given to all of the employees of the electric railway company urging them to observe the particular instructions of Safety Week and to use their best efforts in all directions to forward the movement. Emphasis was placed on the point that the company is constantly striving to forward the safety movement and that this was an opportunity to drive the thought home to the public in a way that ought to accomplish much permanent good.

Throughout the campaign and Safety Week, a great effort was made to emphasize the various dangers that exist on the public thoroughfares but not to antagonize any particular section of the public. By this method of working, the co-operation of every one was obtained. No attempt was made to shift the major blame on any one class of users of the streets, and thus the most effective results were obtained, in our judgment.

No attempt was made to emphasize the fact that it was expected to go through the week without an accident of any sort. This would obviously be impossible in a city of over 700,000 people and it tends to discredit the movement when such a campaign is begun with the statement that every effort would be made to have no accident whatever, and then an accident occurs. As a matter of fact, a car derailment causing injuries to several happened the first day on a small independent suburban line, and in the pictures in the papers the banner with the phrase "Don't Get Hurt" was prominent. Here the lesson was emphasized in a way not desired, yet showing the wisdom of not trying for a 100 per cent score and leaving an opening for ridicule and sarcasm. The slogan adopted was "Don't Get Hurt," and we believe better results were accomplished in this way than would have been accomplished had the committee set out to obtain the impossible, i.e., no accident of any sort during the week.

A unique and most effective bit of advertising and publicity was a monument erected on the Court House Plaza and dedicated by the Mayor, himself, on the Monday of "No-Accident Week." Two pictures are



PROGRAM

No-Accident Week

Proclamation Mayor Broening has issued a proclamation setting apart June 11 to 18 as No-Accident Week.

SPECIAL DAYS

SUNDAY—Safety Sunday observed in all churches and Sunday Schools.

MONDAY—Mayor's Children's Playground Day. Dedication of monument in Court House Plaza at noon.

TUESDAY—Street Railway Day.

WEDNESDAY—Taxicab Day.

THURSDAY—Police Day.

FRIDAY—Railroad Crossing Day.

SATURDAY—Boy Scout Day.

Schools In all public and parochial schools the following program will be carried out.

Lesson in safety each day.

Each child write a letter home to parents and receive reply.

Safety patrol appointed in each room.

Poster contest—1st prize, bathing suit—2nd prize, kodak—3rd prize, sport shoes.

Safety talks with motion pictures in nineteen school buildings having auditoriums.

At school buildings which have no play ground the streets will be roped off during intermission periods.

Monument Erected on the Court House Plaza in memory of the one hundred and thirty children killed by accident in Baltimore in 1921—will be dedicated by Mayor Broening at twelve o'clock noon Monday.

Police 1400 police and other officers of the police department will wear a large badge bearing the slogan "We are helping to make Baltimore Safe". At twelve o'clock noon on Thursday, Police Day, in the Court House Plaza, Mayor Broening will present a gold medal to the policeman who has done the most meritorious act in saving life.

Posters All trucks, delivery vehicles, taxicabs and other commercial vehicles on the street have been requested to carry a poster on either side of their vehicle bearing the slogan "Don't Get Hurt".

Posters will be placed in all store and shop windows.

Large striking posters have been placed at entrance highways to the city, on all public buildings, on bill boards and at railway crossings.

Posters with a message for automobile drivers will be placed in all filling stations and public garages.

Band Each noon hour 12 to 1 the St. Mary's Industrial School Band will parade the downtown sections with safety floats.

Street Cars All street car conductors will give a safety button to each child who rides on a car on Street Car Day; 25000 buttons will be distributed.

Pennants will be attached to all trolley poles throughout the City bearing the slogan "Don't Get Hurt".

Safety posters suggested by the Safety Committee will be placed in all cars.

Bells and Whistles The Mayor has requested that all bells be rung and all whistles be blown at 9:00 o'clock Monday morning, June 12.

Scoreboard A large Score Board 6 ft. by 20 ft. has been placed in a prominent central location.

This Score Board will show the record of deaths and serious injuries by days,—1921—and 1922 contrasted.

There were nine deaths during corresponding week of 1921.—No deaths is our goal for 1922.

Industries The Merchants and Manufacturers Association has requested four hundred of the representative industries to carry out the following program in their plants during the week; conduct a safety drive among their employees; blow their whistles on Monday morning at nine o'clock; place a large poster at the entrance to the factory.

"DON'T GET HURT"

TWO PAGES FROM THE FOUR-PAGE PROGRAM

given of the monument; one, with the Mayor delivering an address to school children and other citizens. This monument was suggested by Chairman John N. Mackall of the State Roads Commission, and every one felt that nothing could have focused attention on the seriousness of our accident situation in Baltimore more than this monument. It was unique in the history of such campaigns in this country, as far as we have any knowledge.

Two posters were carried on the windows of all street cars, one representing a child playing ball on the street, running out in front of a car, and the other emphasizing the anguish that comes to any one who has struck and killed a child. These posters were also displayed all over the city, together with a larger poster with the slogan printed on it. Twenty-seven thousand posters in all were displayed in stores, business houses, lunchrooms, banks and in all fire and police stations and public buildings and on trucks and taxicabs, as well as on the street cars.

To indicate the possibilities of providing playgrounds for children, eighty streets were roped off for play spaces during the week. There is some question as to the desirability of doing this, unless it is to be made a permanent arrangement, because children afterward played in the streets without any protection, where for a week they had been taught to use these blocks without having to give heed to passing traffic.

One very interesting incident was the presentation of a medal to a policeman for a heroic act in saving the lives of some children. A delegation of policemen from each station and a band, in addition to the Mayor and prominent citizens, participated and good publicity resulted.

On Railroad Crossing Day checkers were placed at all railroad grade crossings to observe traffic. Out of a total of 61,301 automobiles observed, 275 failures to operate safely were noted, or 0.4 of 1 per cent, while past records at such locations showed an average of 10 per cent failures to operate with safety. The fact was published broadcast that such a check would be made, and this undoubtedly had some effect on the safe operation. Nevertheless, the fact was borne home to drivers of automobiles. There was not an accident of any kind at the grade crossings on that day.

The boy scouts gave a life-saving demonstration at the City Hall Plaza on Boy Scout Day. They also relieved the traffic officers at their posts and handled the traffic on the city streets for an hour, which was an excellent object lesson.

NO ACCIDENT WEEK JULY 17-24TH DONT GET HURT
THINK ... ACT SAFELY
LOOK BEFORE LEAVING SIDEWALK — CROSS STREET AT CROSSINGS
WALK RIGHT

THIS IS ONE OF SEVERAL FLOATS OPERATED ABOUT THE CITY BY THE RAILWAY COMPANY

All the police officers wore safety buttons, and there was not a fatal traffic accident during the week. The total public accidents reported by the Police Department during the week were eighty-six, compared with 105 during the Safety Week of the preceding year. There were two deaths, one a baby who fell from a porch and the other a man who was drowned in the harbor. There were no deaths among school children and only two serious injuries in which they were concerned. There were no deaths from traffic accidents. Last year in the corresponding week there were nine accidental deaths.

Ten thousand "Don't Get Hurt" triangular signs were distributed through the Automobile Dealers' Association to owners of motor vehicles and garages. Fifty thousand pledge cards, carrying an agreement to obey the traffic laws and safety rules of the highway and be especially cautious at street railroad crossings, in school zones and wherever traffic conditions make driving hazardous were distributed by the police to automobile drivers, all over the city. They were asked to sign and carry them in their machines. The back of this pledge card carried the following safety rules:

SPECIAL INSTRUCTION FROM POLICE DEPARTMENT

Due to the vast number of traffic accidents over the country the Baltimore Authorities are conducting an intensive Safety Campaign with the view of reducing them.

Will you, as a Motorist, DO YOUR PART by complying with the following:

Don't exceed speed limits of 15 miles an hour in congested sections, 20 miles per hour in outlying sections, and 35 miles per hour in open country.

Don't forget to Stop, Look and Listen at Railway crossings.

Don't disregard the child on the curb. He can start quicker than you can stop.

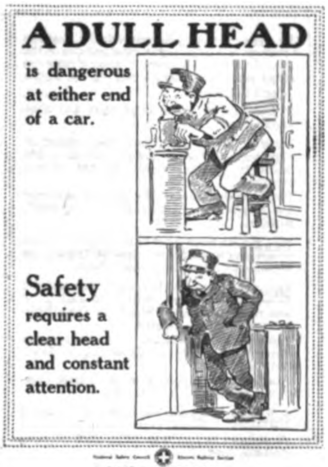
Don't neglect the rights of pedestrians. They have right of way at street intersections.

Don't neglect to approach intersecting streets at slow speed.

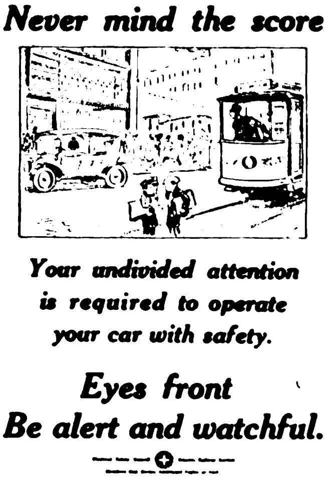
Don't neglect to give proper signal before pulling out from curb into stream of traffic, first seeing that the way is clear.

Don't operate to left of center of highway.

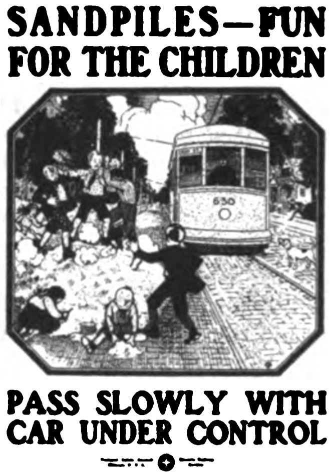
Don't pass on either side of a street car that has stopped for purpose of taking on or discharging passengers.



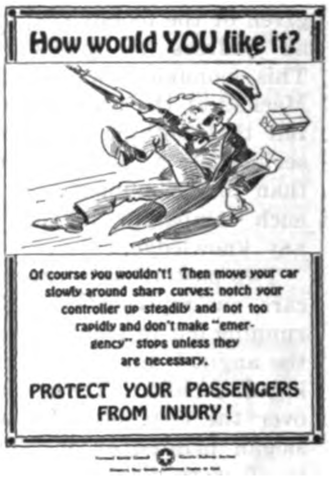
A DULL HEAD
is dangerous at either end of a car.
Safety requires a clear head and constant attention.



Never mind the score
Your undivided attention is required to operate your car with safety.
Eyes front
Be alert and watchful.



SANDPILES—FUN FOR THE CHILDREN
650
PASS SLOWLY WITH CAR UNDER CONTROL



How would YOU like it?
Of course you wouldn't! Then move your car slowly around sharp curves: notch your controller up steadily and not too rapidly and don't make "emergency" stops unless they are necessary.
PROTECT YOUR PASSENGERS FROM INJURY!

National Safety Council Issues Bulletins Especially for Trainmen

Don't fail to give right of way at street intersections to vehicles approaching from right. Don't "hog" your right of way privilege.

Don't drive fast on slippery streets.

Don't crowd another automobile off the road by driving abreast of it.

Don't ignore Danger and Safety signs erected on the highways for your Protection.

In making roadside repairs to tires or engines always stop on extreme right side and never at top of hill or on curve.

This card is handed you through the hearty co-operation and support of the Police Commissioner, Automobile Commissioner, Baltimore Automobile Trade Association and the Automobile Club of Maryland.

SAFETY COMMITTEE,
MERCHANTS' AND MANUFACTURERS' ASSOCIATION.

The street railway company got out a special issue of its four-page pamphlet "Trolley News" and circulated 100,000 for information of the traveling public. In each end of each of its cars it also had a placard with the slogan of the week, "Don't Get Hurt," in plain view of all passengers, with the words: "Of course you are interested."

Meetings were held at twenty schools during school hours, and addressed by the director of the drive, with the safety moving pictures. Safety pictures were also shown in the parks, through the courtesy of the park board, and in many of the churches and Sunday schools the safety subject was emphasized on the first day of the week.

Perhaps the most effective and important result accomplished was getting the safety work into the public schools. The school board has planned, beginning with the next school year, to devote a definite amount of time to teaching safety in all the schools. If any one tried to pick out the best result of Safety Week, I should say it would be this.

We are convinced that a permanent organization to carry out a continuous program of safety work is necessary to combat most effectively the increase in accidents, and one of the results which we hope to achieve as a result of the last Safety Week is to line up a permanent organization. The Mayor of the city now has under consideration the appointment of such a permanent committee to take up and carry forward safety work throughout the year, and this is the logical method to use in safety work, and one which should be of great benefit to the community.

Investment in Safety Profitable

What Britton I. Budd, first vice-president American Electric Railway Association, sends as his message with respect to the value of actively conducting safety work. Mr. Budd has been one of the outstanding figures in the industry in practicing accident prevention work on the Chicago Elevated Railroads, the Chicago, North Shore & Milwaukee Railroad and the Chicago & Interurban Traction Company, of which he is president.

NOT ONLY from a humanitarian, but also from a business standpoint, accident prevention is one of the most important phases of railroad operation. The monetary returns cannot be measured alone from the effect on damage claims. Of even greater value is the confidence of the traveling public in the safety of the railroad. It is difficult to estimate what that confidence brings in dollars and cents, but it is many times greater than the cost of maintaining a safety organization. The public will not willingly patronize a railroad having frequent accidents, the elimination of which requires continuous and systematic safety work.

Britton I. Budd

Prevent Accidents Rather than Pay Claims

An Interview on Safety Work with Cecil G. Rice, President American Electric Railway Claims Association—He Contends a Large Railway Can Afford to Pay Up to $25,000 If Necessary for a Good Safety Director, Whose Activities Should Extend Into General Community Safety Work—Claims Are the Only Expenditures that Bring No Returns—Some of the Byproducts of Safety Are Discussed

BY HARRY L. BROWN
Managing Editor *Electric Railway Journal*

BECAUSE Cecil G. Rice is president of the American Electric Railway Claims Association and has been active in fostering better safety in the Pittsburgh district the *Electric Railway Journal* editors thought he might have some constructive ideas on the subject of interest to pass on to the field through this safety number. So I called on him and imposed on his good nature further by asking his stenographer to take down in his own words whatever bits of wisdom he might choose to dispense. Now that the thing is all done it might be admitted that there was a little unworthy "safety first" in that selection of stenographers, for having had some experience with the mutilation of copy by public stenographers it seemed good forethought to follow a plan that relieved me of all responsibility as to results. But Mr. Rice is so alive to the great need for, and the immense possibilities of, earnest energetic accident prevention work that his stenographer has probably heard much along this line before and the transcript was admirable.

After telling Mr. Rice what my errand was, we settled down to the task in hand. There was no opportunity for him to prearrange a pretty speech, so that what follows is a good exhibit of the knowledge and ideas about safety which are at his immediate command. His responses were entirely spontaneous. Fortunately my questions were taken down too, and these serve to tie the story together, and it is presented here just as Mr. Rice talked it without any "dressing up."

But before starting on the worthwhile part of the matter on this page, perhaps I should qualify Mr. Rice for what he has to say on safety by recording that in addition to being manager of the Associated Bureaus, Pittsburgh Railway, the Philadelphia Company and affiliated corporations, he has found time to serve as president of the Western Pennsylvania Division of the National Safety Council, as a director of the National Safety Council, and as president of the American Electric Railway Claims Association.

RICE SAFETY AWARD

CECIL G. RICE
and the bronze tablet he presented to the company that made the best showing in accident prevention during the year he was president of the local division of the National Safety Council.

Mr. Rice Believes that Accident Prevention Is:

A worthy object
An Americanization lesson
A personal protection
A parental indispensability
An educational requirement
A business necessity
A profitable provision
A legal precaution
A criminal accountability
A civic obligation
A moral duty
A natural trust
A Biblical injunction
A religious service
A humanitarian demand
A community problem
A municipal function
A civilization debt
A national tendency
A universal urgency
A labor union opportunity
A paternalistic essential
A capitalistic virtue
A socialistic contradiction
A bolshevistic opposite
A syndicalistic antithesis

It Affects Every Human Being

With this background a statement by Mr. Rice in his recent booklet, "How a Claim Should Be Adjusted," that 5 per cent of the money now expended by the industry for claims, if applied toward prevention work, would accomplish more lasting results than any other expenditure, was most interesting. He was asked if he could "sell" a manager on this idea and how he would advocate the expenditure of that 5 per cent.

"I am not a salesman," said Mr. Rice, "but I believe managers are susceptible to reasoning based on facts. It has been proved that accidents can not only be reduced but in some instances they can be and have been eliminated. The same fundamentals which have been tested in general industry will apply to public utilities and the public in all activities. Accident prevention has long since passed the experimental stage. It is simply a matter of education. Experience has shown that 85 per cent of accident reduction is through education, 10 per cent by mechanical devices and 5 per cent through discipline."

"Suppose you were to start in with a safety campaign, or any safety work, with the authority to expend 5 per cent of your previous year's claims expenditure. In that work, how would you go about it?"

"First, I would analyze the fatal and other accidents that had occurred in the community where the company operated and chart the cost of fatal and non-fatal accidents. I would then determine the different industries and people who were affected directly by these accidents and form them into a community safety council, as has been done elsewhere. With this organization I would develop safety instruction courses for workmen, managers, superintendents and others, and sell them the idea of safety, which is that safety is a mental attitude. The objective is merely to get the individual to think of the safety of himself and those about him. Unless he is won over to this attitude he is not a safe man either at work or at home or in public. It is my belief that any human being has a point of contact where safety will appeal to him, if that contact can be determined. This plan takes into consideration that safety must not be attempted as a selfish proposition, but on broad general lines backed up by real heart interest. I mean, more specifically, that a traction company should not attempt to do all the safety work that should be done with the public under its own name and for the sole purpose of saving expenditures.

"A traction company has two lines of endeavor. One is that with its own employees and its own mechanical equipment; the other is with the public. Any work done along accident prevention lines in churches, clubs and schools and any association which brings about thought on the part of the individual reacts to the direct benefit of the traction company, because these same people become passengers upon the cars."

"In other words, you would promote traction safety by taking steps to interest people in other lines of safety work?"

"May I illustrate by citing one way in which the reaction redounds to the benefit of the traction company directly. The medical bureau of the Pittsburgh Railways examined 200 persons for employment recently. Out of these 200 men, eighty had received safety instruction in other companies. The company also got the benefit of their training before they became employees, for they were naturally thinking and disseminating safe conduct before they came into the company's employ."

"What would you do within the traction company itself to promote accident prevention in connection with the things the company only can control?"

HOW TO ORGANIZE THE RAILWAY FORCE

"The work within the organization itself is upon the same fundamental basis; that is, of developing thought. To be successful the work must be systematic and persistent. Brass-band methods are only of use in centering momentary attention. Every unit within the company organization must be organized on the idea of safety and the idea 'sold' to the men, not forced upon them. It must start from the highest executive officer and work down to the men on the job. Safety is a specialty just as much as accounting, for instance. It is not a matter which can be left to the operating department, because its immediate function is to keep the cars moving. On a property that operates over different divisions, I would first organize in each carhouse a safety committee with the local superintendent as chairman, with dispatchers and representatives of the men, either elected or appointed, and change the personnel frequently so as to bring in new thoughts and new men. This safety committee would report to another committee which included the entire division. The chairman of the carhouse committee would form the division committee with the division superintendent as chairman. The division superintendent would then report to a central safety committee including, in addition to the division superintendents, the general manager, superintendent of transportation and other department heads. This central safety committee would receive the suggestions sent from the other committees and report to an executive committee, which would include the highest executive officer of the company and be composed of possibly five or more executives who would have the authority to put into effect any recommendation they might approve."

"That organization would function primarily to act upon safety suggestions brought up from the bottom, but how would you take safety suggestions down from the top?"

"The same organization can be used to carry out executive orders. Anything desired by the executive committee would be put into effect by recommendation from this body to the central safety committee, and so on down through the safety organization."

"What would be your means of training employees?"

SAFETY SELLS ITSELF

"Safety is something that sells itself if a person with a heart and personality and the ability to express himself and having a knowledge of the accident hazard finds an opportunity to reach any group of any size. Each of the carhouses should hold meetings of their men when the crews are changing, or, if necessary, in the evening and the men paid for the time they spend. To start with, the accidents should not be discussed as a traction proposition, but as it touches the individual, as it affects the man himself, his family, his relatives and neighbors. This gets it away from the selfish motive. Accidents really have an appeal to every human being. For instance, it is possible to show that accidents, fire and sickness caused an unnecessary expenditure of $3,500,000,000 last year in the United States. This means a cost of $35 to each individual, or $175 for each family of five. This expenditure is unknown to most people, but it is reflected in all their purchases. Accident costs are included in the price of clothing. A painter charges in his overhead the cost of workman's compensation. It is included in the building of houses, in practically everything."

"Just how is that reflected in street car fares?"

"Every time money is spent by a traction company on account of accidents, or the claims which follow accidents, this takes away that amount that otherwise would be available for service and equipment. Claims are practically the only expense a traction company has for which there is no return. Even in taxation paid to the city or county or government there is a return in the form of protection and service. Claims not only return nothing, but they are the source of much antagonism."

"You make the statement that it is possible to avoid accidents on a street railway system. How far can that statement apply?"

"It applies just as far as a company is able to develop and maintain safe equipment and train its men to avoid accidents, and to educating the public to habits of safe thinking and acting."

"Then you think there is no irreducible minimum as regards accidents?"

"If the work is properly organized, each year's result should show a reduction over the previous year's number of accidents, except where extraordinary disasters might occur. There is, in addition to the reduction in the number of occurrences, what is equally important, and that is the reduction in severity of occurrences.

"The value and advantage of accident work, however, should not be confined simply to the saving of claims costs because it has been found to be very efficient in developing the morale of the employees and in building up improved public relations."

"Now that is expressing the value of safety work in general terms, but some general managers would want you to get down to brass tacks, as to the value of it. How could you show them that it is something they cannot afford to overlook?"

"A traction company is usually thought of as a cold, impersonal and heartless corporation. It is believed to be greedy. The opinion of the riding public is formed very largely by that which they see of the individual representative on the cars; that is, the motorman and conductor. You can readily see that if we who do our work in offices were forced to stand on blocks subject to the critical gaze of every one who passed, we probably would do things that might be offensive. That is what the conductor and motorman have to guard against. Now when people come to realize that the conductor and motorman operating the car upon which they are riding are individuals with a heart and family and are doing the best they know how to avoid an accident, and that the company itself earnestly desires to prevent accidents to passengers and to all persons who may approach the hazard in any way, there is a personal response that gives an entirely different opinion of the men, and therefore of the corporation.

"Some time ago," continued Mr. Rice, "I was a passenger on one of our cars when the motorman saw a little girl who evidently desired to cross the street. He stopped and the little girl started across the street but saw another car coming and turned back. The motorman locked his car and personally escorted her across the street safely. When I left the car, I said to him, 'Mac, that was mighty fine of you to help that child across the street.' He replied, 'Oh, I have children of my own and I wouldn't want them to get hurt.' In this, the motorman showed the angle of appeal in his case to be the thought of his own children."

HOW TO KEEP UP THE INTEREST

"Do you think it a good idea to try to stimulate unusual interest in safety work among employees by having large meetings and talks, or is that a form of interest that is too difficult to keep up?"

"Since the objective is to cause the individual to think, efforts with groups are the best means of attack. It is just as easy, or easier, to impress your thoughts upon a gathering of 1,000 or 2,500 people as it is on one person. I would think that group meetings are by far the most efficient way of reaching the men."

"Is it not true that in times past a good many electric railways have gone into safety work with great success for a while, but that the work has gone stale?"

"The reason for that is that much of the effort has been spectacular and not built along constructive lines. While the work was interesting for a while, it was probably not systematic and persistent and it was carried on under the name of the traction company, which gave those unfriendly to the traction company an opportunity to condemn and belittle the work. When the work is done through a locally organized safety committee or council and includes all lines of accident prevention and not simply traction accidents, there is no let-up in the result. The accomplishment should increase from year to year.

"It has been learned that accidents involving automobiles have reached the highest peak among causes of fatal accidents. There are 10,500,000 automobiles in the United States. That is one for each ten people, or one for every other family. They are increasing at the rate of 20 per cent or more than two million cars per year. Their development and general use has far outdistanced the means provided to control them. Nevertheless, it is possible to control them. First, the manufacturer of the car should sell the idea of safety with the car itself. When a person is learning to operate his car he is susceptible to advice and would then receive safety suggestions he would laugh at and ignore after he had become an expert driver.

"The second step, in which a traction company can assist, is in forming and securing enforcement for uniform traffic laws. When the automobile was used for short jaunts from the owner's home to the office, the traffic laws then in effect were sufficient, but now a week-end trip may take a car into several different states, each with different traffic conditions and rules. Support should be given to organized efforts being made for uniform traffic laws.

"Third, it should be brought about that before a person is permitted to drive a car he should demonstrate his mental fitness and physical ability. It is ridiculous that any individual, in most states, can secure a license upon mere application. Before a person can operate a steam engine he must pass an examination. It is criminal for a man to carry firearms, where he must develop an intent to do some harm before it becomes dangerous. An automobile has many times as many possible victims and the injury is without intent, but there is no reason why a careless automobile driver should not be as criminal as the carrier of a revolver.

"The next thing to bring about is the strict and impartial enforcement of traffic laws by city, county and state authorities. The next step is to secure the strict and impartial enforcement of traffic laws by the courts. Another means of reduction is to organize safe drivers' clubs, interesting the owners, the drivers and those who superintend the operation of large fleets of cars, and hold meetings which are attended by the drivers. The same appeal may be made to them as is made to any workman and thus bring about a public sentiment which is reflected in the enforcement of the laws."

CONTEST PUTS ZEST INTO SAFETY

"In planning safety work on a railway property is not a good deal to be accomplished by fostering competition in accident records among the various divisions?"

"No division superintendent can operate and control his division efficiently without a knowledge of what is occurring upon his division. Only by comparison with the results obtained upon other divisions can he determine what should be accomplished. Competition is one of many means, but always the objective should be kept in mind: to develop a mental attitude. My experience has been that division superintendents are so intensely human that there is temptation to excuse themselves. The most frequent excuse found is—'I report every accident occurrence on my division but some of the other fellows don't.'

"To overcome this overworked excuse, certain points of comparison should be developed. I would suggest something like this: First, the average number of witnesses per accident; second, the per cent of unreported accidents to the total number of accidents; third, the number of accidents per fatality; fourth, the number of accidents per million car-miles; fifth, the number of accidents per million passengers; sixth, the number of accidents per suit entered; seventh, the cost of accidents per million car-miles; eighth, the cost of accidents per million passengers; ninth, the average cost per accident; tenth, the percentage of gross revenue expended for claims.

"I have seen comparisons of this kind made which developed amazing differences among the various divisions of a company. Of course, there are some operating variables in different divisions, but in such cases this can be overcome by restricting comparisons as far as possible to those conditions that are standard in all.

SOME GENERAL ASPECTS OF THE WORK

"The statements I have made are based, for the most part, upon my actual experience. It was my privilege to serve as president of the Western Pennsylvania Division of the National Safety Council, including twelve counties in Pennsylvania, during the year 1921. Originally it was an industrial organization. A study of the statistics showing fatal accidents revealed the fact that industry was responsible for less than one-third of the fatal accidents and that automobiles, burns and scalds, and falls, entirely aside from industry, were the leading causes of accidents. One thing that impressed this on my mind was the case of a workman who was given the Carnegie Hero Fund Medal and money for having saved a fellow workman who was overcome by gas in a pit. This same man shortly afterward, on his way home from work, was struck by an automobile. His back was broken and for the remainder of his life he is a hopeless cripple, dependent upon the support of his wife and minor children. This led me to think how useless it was to keep a man safe while at work but allow him to be exposed to danger in public. Then it was that I recognized the necessity for combining industrial, home and public safety work, because the fundamental objective is the same in all three lines: To create a mental attitude that will cause the individual to think and *want* to prevent death, injury and loss from accidents, fire and sickness to you, yours and others, at work, at home or in public—a triplet expression phrased to help put over the idea.

"If a man is injured at work he at least is given medical attention and the workman's compensation benefit. Injured about his home, or on the streets, his family is cut off from that support by reason of his accident. It has been shown, based upon workman's compensation data, that it is twelve times more important to the individual to protect himself than to the company which employs him. We therefore turned the industrial organization into a council having as its object '*safety always and all ways*.'

"Safety instruction courses were arranged where speakers on various accident hazards appeared. One of these courses ran eighteen weeks, meeting every Monday evening. The attendance increased from 500 to 2,500. At one banquet, at $3 per plate, more than 1,000 people interested in all phases of safety work attended. The Superintendent of Public Instruction caused accident prevention to be taught in every school in the Commonwealth. The city schools took up and are teaching safety in connection with their regular studies. It has been made one of the major studies. Although the Coroner of this county operates his office on a fee basis he has been won over to the work of accident prevention and is using all personal and official power to that end."

Mr. Rice was then asked for the tangible results of the Western Pennsylvania Division of the National Safety Council. He said:

"The effect of reduced accidents under workman's compensation showed a net saving of $500,000 in the twelve counties where this work was carried on. A reflection of the effect of this work was shown in the number and severity of traction accidents, which were reduced from a year's peak of ninety-six fatalities to twenty-seven, which was the lowest in the history of Allegheny County. In three years traction accidents decreased 33⅓ per cent. In the same county taxicabs formerly had a considerable number of collisions with street cars. One of these companies reduced its total number of accidents 85 per cent and this reduced the insurance premium $12,000 per year—from $800 per car to $75 per car, which is the lowest rate in the United States."

"Your idea is that a traction company should have a man who would devote his entire time and energy to safety work. Do you think that his attention should not be confined to the traction company entirely, or should it be given over partly, also, to general safety work in the community?"

"Generally, yes. He should take an active part in the work as a community thing. There are but three ways to carry on safety work; that is, through organized community work, through an organized safety committee among employees, or by doing a few of the things that would be done by those organizations, although they do not exist. The job has to do with human nature. It requires an expert to be successful at that. While it should not be so, it is my belief that to start with, the greatest task of a safety director would be to sell the idea properly to the traction officers themselves, and to bring about an efficiently developed plan that would lead to the objective sought. Concrete detailed methods of organization will be a feature of the Claims Association convention at Chicago the week of October 2."

"How much do you think a traction company could afford to pay for a director of safety, based on results that might be expected?"

"A large property could afford to pay whatever is necessary up to $25,000 per year to get a man who could handle the work properly. For example, take the 5 per cent for prevention work mentioned earlier.

"A company with twenty millions gross receipts may have a claims cost of about 5 per cent or $1,000,000. Of that amount, 5 per cent would provide $50,000 for expenditure on claims prevention work as follows: One-half, or $25,000, for the director's salary, and $25,000 capital for the rest of the safety work. If this safety director could forestall ten claims verdicts in the course of a year he would more than pay for all the expenses of the safety work besides creating a condition that will continue and increase such savings.

"There is no other industry to which accidents and the resultant claims mean as much as to the traction company. A safety director must have highly developed executive ability. Such ability is worth as much in safety work as in any other line of endeavor.

"It is my belief that in ten years from now there will be no claims departments. Their title suggests and encourages claims. The need for having them is removed when accidents are prevented. All money expended for claims is wasted. Accidents can be prevented. Claims can be prevented. These are the possibilities. That they can be reduced is a proved fact. An efficient safety director could, I believe, take a property, and under reasonable conditions almost guarantee to bring about a fixed proportionate reduction with a fixed expenditure."

Safety—and the Safety Engineer on a Transportation Utility

The Many Duties of a Safety Engineer—What Such an Official Has Accomplished on the Lines of the Beaver Valley Traction Company —The Qualifications of a Safety Engineer

BY W. H. BOYCE
General Manager Beaver Valley Traction Company and Chairman
Safety Committee of the American Electric Railway
Transportation & Traffic Association

OUR safety department has reduced its claims cost from 9.42 per cent of the gross revenue to 1.96 per cent in 1920 and 2.07 per cent in 1921. Accidents, in point of number, eliminating special reports required but not classified as accidents, have been reduced 49 per cent.

Up to May 29 of this year we operated for eighteen months without a fatality accident. Then there was one, for which the company was not responsible, to a pedestrian on the street. There has been no passenger fatality in eight years. There has been but one employee fatality in eight years.

We have but three law suits pending, and the last five cases tried in court resulted in our favor either by non-suit or verdict for defendant.

Our annual gross revenue is about $720,000. Last year we collected more than 13,500,000 fares, not including transfers.

The total number of classified accidents was 706, including 224 accidents in which automobiles were concerned, and of this number 111 were where automobiles had collided with the rear, side or front of our standing cars.

The first safety committee meeting held on our property was on Sept. 9, 1912. This was three years after I came to the property.

In 1909 this car line compared favorably with many others of the period. There was a great deal of prejudice against the property and those connected with it, most of it uncalled for. Undoubtedly those in charge had conducted the property in a way to compare favorably with the condition on other roads of that time. The usual opposition to a utility and the political baiting existed to a great degree.

As a new management we found some methods in force and some of the equipment inherited which did not entirely meet with our approval. It was seen that our first duty was to learn just what the public believed it wanted and then make an effort to give it or make a reasonable explanation why certain things could not be given. In this we met discouragement. The public was not ready nor always willing to believe what we gave as our reasons. We learned that what the traction company said was "taken with a grain of salt," even though it was the absolute truth. Organizations had arisen which had for their avowed purpose improvement of traction conditions, or what they considered improvements. Frankly the situation presented was a most trying one.

FRONT AND END VIEWS OF THE SAFETY CARS IN REGULAR SERVICE ON THE LINES OF THE BEAVER VALLEY TRACTION COMPANY

This car has created a great deal of attention and has been the subject for much newspaper mention in various parts of the country. It has a safety appeal suitable to all who can see

H. O. Allison, now our safety engineer and employment supervisor, was then general manager of the *Daily Times*, the most influential newspaper in our territory. He had been in conference with the officers of the company on several different occasions in regard to traction problems, and we had learned even then that from the editorial sanctum of the daily press could be gleaned valuable information as to public sentiment and public relations. We knew that the public was not in accord with the traction tactics of the day. Many local men were interviewed for the purpose of ascertaining just what could be done to bring about more harmonious relations.

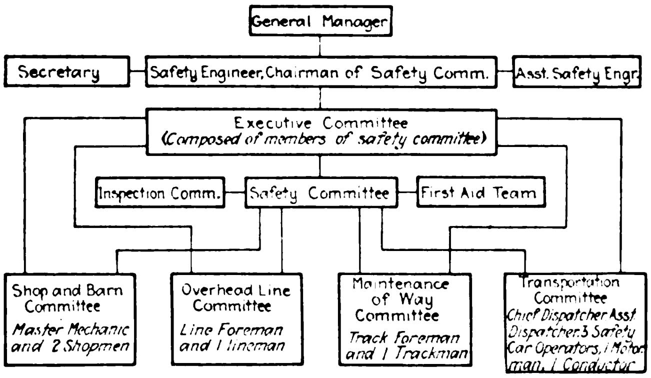
On Jan. 23, 1912, a letter was received from Mr. Allison setting forth a proposed campaign of paid advertising. In making that suggestion he said in part:

> Your advertising will prevent accidents through the education of the public. Try advertising for one year. One law suit less will more than pay the bill. You should advertise to teach the patrons of your line what they can do to make your service more satisfactory. It will create good will.

> If you should go along in a way implying that you are doing a favor to permit anyone to ride on your cars, failure faces you. You should be grateful, not the public. Let the public understand that you are grateful and you will win its approval.

In that we found the solution. Lapse of time has justified the belief. Shortly after this proposal was received, with the aid of Mr. Allison, an accident prevention advertising campaign was mapped out for the road and copy was written, considered and sometimes rewritten. As the project was so new, frankly we had some hesitancy about just how to take the first step.

One of our first advertisements was entitled "We Will Pay If We Owe; We Will Not Pay If We Do Not Owe." Another was a full page of "Don'ts" for passengers, pedestrians and drivers. Since then we have learned not to say "don't," we prefer the word "never," and to say what we have to say in fewer words. Our copy was read and began to have its influence. We were then convinced that we had rubbed Aladdin's lamp, and found the gold in "safety and publicity."



General Manager

Chief Dispatcher Asst. Dispatcher. 3 Safety Car Operators, 1 Motorman, 1 Conductor

PLAN OF THE ORGANIZATION OF THE SAFETY COMMITTEE OF THE BEAVER VALLEY TRACTION COMPANY, NEW BRIGHTON, PA.

SAFETY ENGINEER APPOINTED

Until Mr. Allison left the local newspaper field in 1916 to enter a manufacturing project we collaborated on the preparation of advertising for the road. The coming of the World War changed his plans and on our solicitation he entered the Associated Bureaus of the Pittsburgh Railways and Duquesne Light Company at Pittsburgh, Pa., under the able leadership of Cecil G. Rice. His progress there was rapid, and through a special arrangement a part of his time was devoted to our company, as we saw the field and need for some one learned in safety principles and accident prevention and had in mind his affiliation with our property just as soon as the position could be created for him. This was done in 1919 when Mr. Allison was appointed safety engineer of the property. It was the first case of such a position on any street railway, so far as I know.

THE RESULTS OBTAINED

In addition to the results mentioned at the head of this article it has been our good fortune to bring about the following:

1. Co-operation of the public, through an understanding of the problems of the company.
2. Material reduction in the cost of accidents and claims until the department has become a revenue producer through the amounts saved from this source alone when compared with other years.
3. Increased fares: Four specific changes have been made without protest.
4. Employee co-operation: The adjustment of wage scales has always been peaceable. During the period immediately following the war the employees loaned the company $8,000 to assist it over a critical period. The employees also have a material interest in the costs of operation and expenditures made as well as in the merchandising of rides.
5. Co-operation of the public in that requests for $420,000 for paving in 1921 were trimmed to $15,000. Relief has been had on other stretches through the granting to the company of a private right-of-way with curb alongside to prevent travel on the tracks. This has been of material assistance in reducing accidents and making schedules.
6. Prevention of accidents: Decrease of claims costs, decrease of prejudice, creation of friends instead of foes, co-operation instead of hindrance.

We have the facts tabulated. They are here to be seen. They stand as our record and our proof, and their study by any railway official in any capacity is welcomed.

Credit for these results does not center in any one individual. The entire personnel of our organization is important to the whole scheme. From employees in minor positions we have received suggestions and recommendations whose adoption helped in the whole result. Years of growth have been required to help mature some of the plans.

COMBINING DEPARTMENTS

We combined our claims department with the safety work supervision and employment. In doing this we did what we consider the only logical thing for any road of this size to do. The claims department is called upon to investigate all accidents and adjust all claims. Why should it not work to prevent them? The men are concerned in the accidents, so why should not the claims department have the say as to the type and character of the men employed?

Our safety engineer has made many contributions of safety articles to the public and technical press. He is frequently called upon to address various organizations on the subject of safety. During the past year more than fifty talks have been made in the public schools. He is the proud owner of some 1,500 accident posters made by school children, following his talks to them. These were made on a special card 11x14 in. which we supplied.

SAFETY COMMITTEE ORGANIZATION PLAN

The safety committee is composed of the safety engineer, the assistant safety engineer, a secretary, and fourteen members consisting of master mechanic, two shop employees, chief dispatcher, assistant dispatcher, three safety car operators, one motorman, one conductor, line foreman, one lineman, track foreman and one trackman, and is divided into an executive committee, inspection committee and department committees. The personnel of No. 1 first aid team is made up of members of the committee. A second first aid team is composed of selected employees.

Recommendations concerning any department are first referred to the members from that department, who in turn place it before the safety committee. The recommendation may then go to the inspection committee for a complete report, or may go direct to the executive committee, which, if approving, refers it to the safety engineer, who in turn refers it to the general manager.

Under the supervision of the executive committee special monthly meetings are held with all employees. Meetings of the entire committee are held at least once a month. Each six months the terms of six of the members expire and new members are elected from nominations proposed by any employee, subject to the vote of the remaining members of the committee. The secretary of the committee has charge of all records.

In our opinion no public utility is complete without its safety committee. Any public utility having experience with the work of such a committee will never after be without it. On this and the next page some of the activities of our safety department are listed.

THE QUALIFICATIONS OF A SAFETY ENGINEER

Complying with the editor's request that I analyze the qualifications of a man best fitted to become a safety engineer on a public utility, I should first say that this is a position that requires careful consideration in filling. Many employees can work at it, but few will be able to accomplish the desired results.

If the choice has to be made outside of the organization a man should be selected who has had a good general business experience, preferably one who has made a success of safety, claims or newspaper work or as a salesman. The qualifications should be those of a successful man in any walk of life. He must have initiative, persistency, judgment, diplomacy, sympathy and an earnest conviction of the fact that he is able to conserve human life by his work. He should possess the stamina, energy and vocabulary to express himself in any situation that may arise. He must be able to judge and handle men. His general knowledge must be sufficiently broad to compare favorably with that of those with whom he is to come in contact. He should be able to surround the position with a certain dignity and he should have a goodly portion of authority. Preferably he should have had some experience in accident prevention work. This is more important than a knowledge of electric railway operation, which can be acquired if he does not have it.

If the safety engineer is appointed from the employees of the company and has had no previous safety experience, he should have an opportunity to study up on safety organization and methods before beginning his new work. This information may be gained by getting into and keeping in touch with the electric railways that are among the foremost in organized safety work.

A man of family is preferred to avoid the same anomaly that is presented when old maids attempt to instruct the mothers of children in the care of their darlings. It takes a man with a child of his own to realize what an accident to a child means.

A good safety engineer is a treasure, because he will organize a safety committee and do wonders with it. Without him, such a committee would be like a ship at sea without a rudder. A general manager cannot couple such work with his own and get the results desired. It is perfectly proper for the manager to work in harmony with the project and probably pass on many of the things which are called to his attention. That is expected, but for him to be the "daddy" of safety gives the child a parent out of place with the schools he will attend as he grows up. Safety engineering is a profession, a commendable profession and one in which a man of the highest caliber is justified in working, and it is a work to which the highest type of men is being attracted. It is a work which, when it is once understood, grips a man's soul and energy to the point that he becomes tireless in his efforts. To sow that seed and create that interest among the indifferent is the work of a professional safety engineer and none other will be able to do it so well.

MORE ACCIDENTS IN CIVIL LIFE THAN CASUALTIES IN MILITARY SERVICE
DON'T TAKE CHANCES! THINK! SAFETY FIRST
TAKING A CHANCE! RISKING HIS LIFE —AND OTHERS
DON'T CUT OFF APPROACHING CARS.
TRAFFIC RUNS IN BOTH DIRECTIONS
TOO LATE TO BE CAREFUL
DEATH'S PLAYGROUND! WHERE DO YOUR CHILDREN PLAY?
WAIT! BETTER LOSE A MINUTE THAN YOUR LIFE
DON'T FORGET! ONE CAR MAY HIDE ANOTHER
GAMBLING! LIFE AGAINST SECONDS
SOMEBODY'S CHILD SOMEBODY'S FAULT! WHERE DOES YOUR CHILD PLAY?
TOO SMALL TO THINK OF SAFETY. KEEP HER OUT OF DANGER

SAFETY COMMITTEE OF THE BEAVER VALLEY TRACTION COMPANY

This photograph was published along with a first page news article in three daily papers of the territory announcing a public Safety Rally attended by 1,500 who came on individual invitations issued. The members of the committee are: Top row left to right: T. B. White; M. S. Walker; J. E. Cossin; O. W. Ward; W. F. Allshouse; Dana McDade; B. A. Beebout; Alex Webster. Center row left to right: J. J. Tesh; W. H. Boyce, general manager; Agnes F. Hartman, secretary of the committee; H. O. Allison, safety engineer; R. M. Ague. Bottom row left to right: J. W. Kelley; J. R. Marshall; D. Lee Noss.

OUR SAFETY ENGINEER'S DUTIES

From our office manual we take the following which defines in a general way the work of the safety engineer on our property:

> This department has jurisdiction, supervision and responsibility in degree set forth and concerning the following:
>
> *Accidents:* All investigation. All inspection. All adjustments if indicated for liability, possible liability or policy reasons. Declining if so indicated by the facts unearthed and assembled from all available sources. Preparation of all accident cases in suit. All necessary court inspection, records, assembling of the facts and concise presentation preparation for use of attorneys at trial. Consultation with legal department. Summoning of and payment of court witnesses. Locating of witnesses. Checking of claimants pending adjustments and those in suit. Preparation of defense and presentation of defense facts in cases at suit. Attendance at trials. Testifying. Direction of engineers' plan of scene of accident and the photographing of the scene. Indexing, filing, and recording all claimants, principals in no claim occurrences, observers, employees, public officials, doctors, lawyers, laymen, and those concerned in occurrences resulting in injury, and those involved in suits in trespass.

Accidents: Prevention of. Talks to men. Written instruction on rules concerning violation of and enforcement of rules. Bulletins giving cause of accidents, illustrating, and making known preventive measures. Training of men. Cautioning of men when indicated. Selection of trainmen. Creation of desire for no-accident record, and a first thought for safety.

Employment: Selection of all trainmen, source of supply and employment of barn, track and office employees. Application records. All inquiries and checking of past employment. Applicant tests. Service records.

Injury: First-aid room, equipment and supplies. Application. Instruction. Recommendation.

Workmen's Compensation: Entire charge. Complete responsibility as to records, reports, and payment as fixed and provided for under the State workmen's compensation law.

Safety: Inspection of property, plant, track, equipment and manner of work. Recommendations. Suggested improvements. Enforcement.

Medical: Attention. Selection of physicians. Physicians' reports. Payment of physicians. Physicians' records. Hospital selection. Payment of hospitals.

Employees' Welfare: Recreation. Physical recommendation. Consultation. Financial aid investigation and recommendation to general manager. Housing. Legal service. Medical attention.

Funds: Active account for payment of cash releases and expenses. Reimbursement made through proper department.

Incidental: Police report to this bureau. Records are kept here. This bureau advises and if need be attends at hearings.

Publicity: Construction. Policy. Discussion. Dissemination. Verbal and direction of publication.

Reports: Comparative and accumulative of accident claims cost, welfare, traffic, workmen's compensation, legal expense.

Annual Report: To be prepared at close of fiscal year and should contain reports comparative and cumulative. Samples of work. Records of occurrences. Bulletins. Suggestions. Recommendations.

But with all the direction, suggestions and detail duties outlined by the Office Manual it is impossible to obtain the results desired unless the man selected has a heart interest in his work and is one who continually dreams of and then thinks out new ways for accident prevention material to be put over properly with employees and the public.

Newspaper Reprints Houghton Safety Circular Entire

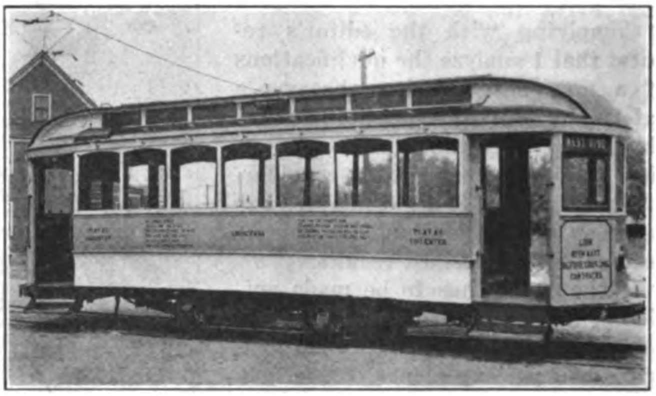
WITH the aid of matter and cuts supplied by the National Safety Council, Receiver S. B. Tuell of the Houghton County Traction Company has been doing some good work among the school children of the district—so much so that one of the local papers reprinted entire the four-page leaflet of June 2 issued as the School Safety Number of the company's own publication, *Traction News.* This leaflet carries brief safety talks on each of its four pages and carried catchy illustrations.

The safety message to the school children was put across in several ways. One was in the form of direct talks to the younger children by the company's safety representative; another was in placing a copy of the leaflet on the desk of every high-school student, and a third was in the usual distribution via the cars. A little different practice followed in the latter case is that in addition to the usual box from which passengers can help themselves, there are pamphlet clips on every window post. The platform men take care that each clip always contains one copy of *Traction News* so that the passenger having the circular staring him in the face is more likely to reach up for it than if he had to take it out of a remote box. The customer may be always right, but he is sometimes lazy.

Kiddies' "Play-as-You-Enter" Safety Car

CARRYING the message of safety to children at the time they are most responsive to the teaching—while at play—is the idea back of the "Kiddies' Kar" which the Pennsylvania-Ohio Electric Company has placed in Cascade Park, New Castle, one of the cities served by its railways.

A disused small car is used for the purpose and has been turned into a play car for the children's playground at the park. It has been completely redecorated inside and out, the outside being attractively painted in white and blue with red trimming. Inside the car in the advertising rack are nursery rhymes, pictures for children and the like to entertain them. The youngsters have the full run of the car and are at liberty to play at being street car men and passengers to their heart's content, the car being fully equipped with gong, fare register, signal bells, controller handle, brake handle, and all the other paraphernalia of a street car.



THIS IS AN UNUSED "PLAY-AS-YOU-ENTER" CAR IN A PARK, AND THE KIDS CAN PLAY IN AND AROUND IT. IT IS DECORATED WITH SAFETY MAXIMS

But while running about, in and out, the car the youngsters are met with safety suggestions designed to impress them with the danger of practices in which children are apt to indulge. Each of the four corner panels of the car has been painted yellow and on this vivid background in bright red are the warnings:

"Look both ways before crossing car tracks."

"Never touch hanging wires; they may be deadly."

"Don't play in the streets; it's dangerous."

"Be careful always and you will be safe."

Then on the bright blue band under the windows are painted parodies on Mother Goose rhymes carrying further safety thoughts. These are:

Hey, diddle, diddle,
The Cat and the Fiddle,
  The Cow jumped over the moon.
Take care when you jump,
Or you'll get a bump
  And spoil a whole afternoon.

Tom, Tom, the Piper's son,
Learned to play when he was young.
He learned the safest way to play
Was from the tracks to keep away.

Before the play car was placed in the park it was paraded over every car line in New Castle, carrying a boys' band, which made plenty of music to attract the attention of thousands of persons. It will be run over the lines of the city from time to time to carry the safety thoughts to as many youngsters and grown-ups as possible and at the end of the park season will be placed in various playgrounds about the city where it can continue to amuse the boys and girls and give them some safety instruction.

Organized Safety Work Pays

In Addition to Other Advantages Material Reductions Were Made in the Rate Paid for Compensation Insurance and in Damage Claims

By F. H. Hill
Vice-President Elmira Water, Light & Railroad Company

THE Elmira Water, Light & Railroad Company is a combination utility furnishing electric light and power, natural gas and street railroad service. The total number of employees is about 325. The company operates 48 miles of street railway lines, both city and interurban.

Organized safety work on our property was begun about two years ago, at the suggestion of the Utilities Mutual Insurance Company of New York City, our compensation insurance carrier. It was really the rather selfish idea of reducing insurance premiums which prompted us to undertake this work.

A safety committee was organized, with myself as chairman, consisting of a number of department hands, foremen and workmen, so that each department has one or more representatives. Then we have also a safety inspector, a member of the committee, whose duty it is to make weekly inspections of all the company's property for the purpose of discovering accident hazards. Usually another employee (a different one each week) accompanies the safety inspector on his weekly inspection trip. Similar inspections are frequently made by the engineers of the Utilities Mutual Insurance Company.

The safety committee meets once a month in my office, when the recommendations of our safety inspector of the utilities company and safety suggestions of employees are carefully considered and passed upon. Orders for carrying out suggestions and recommendations are sent to the proper foreman by the safety inspector, and such orders are followed up until completed. We constantly invite and urge employees to send to the safety committee suggestions and constructive criticisms, primarily having to do with accident prevention, but suggestions along other lines are also welcome. Many excellent suggestions are obtained in this way. All suggestions from employees are answered, telling what action was taken and giving the reason if the suggestion cannot be carried out.

A typical suggestion was that received from a motorman recommending the painting of the word "stop" on the folding doors of safety cars, so that when the door is open the word "stop" in large letters is plainly visible to the drivers of vehicles following the safety car.

The meetings of the safety committee are decidedly interesting and valuable. While most of the time is taken up with safety problems, quite frequently other matters of general interest to all employees are discussed. The meetings are informal—all members sitting around in a circle and cigars are passed. As a result all the members of the committee feel at home, and no one is afraid to give his opinion of the various subjects that are brought up. At each meeting all accidents during the preceding month are gone over with a view of preventing similar accidents in the future.

In order to reach all the employees of the company directly we frequently hold meetings of various groups where a representative of the Utilities Company gives a safety talk, followed by a demonstration of the prone pressure method of resuscitation. We have also held employees' meetings where safety talks were given to employees and their families.

We also make use of bulletin boards at points where they will be seen by all employees. We are subscribers to the Elliott service pictures, and these pictures, changed every day, are placed beside the bulletin boards. On the bulletin boards are posted safety bulletins furnished by the National Safety Council and the Utilities Mutual Company, also notices of our own asking for safety suggestions or giving the employees' accident record. As a means of preventing public accidents we have occasionally used newspaper space inviting the cooperation of automobile drivers in accident prevention.

Among the tangible results of our safety work has been a considerable reduction in the number and severity of accidents to employees and a marked decrease in accidents to the public.

ADVANTAGES SHOWN BY FIGURES

The reduction in accidents to employees can be seen from the following table of accidents:

	Lost Time Accidents	Days Lost
1921	31	2,441
1922 (at rate of)	14	160

The accident record for 1922 is based on actual results for the first six months, multiplied by two.

The effect of our good accident record is indicated in the rates per $100 payroll on our compensation insurance:

Carhouse rate 1921	$3.087
Carhouse rate 1922	2.233
Average rate for entire property 1921	3.268
Average rate for entire property 1922	2.559

As our payroll is in excess of $400,000 per year the reduction in rates has meant quite a saving in our annual premium.

Another indication of the effect of safety work is the reduction in the cost of public accidents on our street railway system. For the past five years the cost has been as follows:

1917	$10,831.60
1918	17,881.47
1919	25,563.34
1920	13,375.79
1921	8,244.98

The increase from 1917 to 1919 was no doubt caused by the increased traffic and congestion of the streets due to the large increase in the number of automobiles.

As stated, organized safety work was begun on our property early in 1920, and at about the same time we began using safety cars. The reduction in public accident costs on our street railway system during 1920 and 1921 is due to both the organized safety work and the use of safety cars. It is rather difficult to say just how much of the credit should be given to organized safety work.

To sum up, I might say that organized safety work on our property has proved well worth while from many points of view. It has resulted in a reduction in accidents to employees, thereby decreasing the cost to us of compensation insurance and also greatly increasing the morale among our employees because of safer working conditions. Similarly a decrease in accidents to the public on our street railway system has occurred, with a great saving to us in damage claims and a reputation of safety for our street cars. To the manager of a public utility that has not yet undertaken organized safety work, I would say begin at once. It pays.

Organized Safety a Positive Force in Reducing Accidents

As So Much Depends on the Operatives, the Greatest Care Should Be Used in Their Selection and Training—The Collateral Advantages of Safety Campaigns Are Considerable—Safety Should Be Made a Major Policy

By A. W. Koehler
Director of Safety, New York State Railways

ORGANIZED accident prevention in the electric railway field is an institution of recent times. The last decade has seen it develop from a very humble beginning to a place where its positive progress is now readily discernible.

One of the difficulties in the way of the accident preventionist has always been the fact that the results of his work have been intangible. There was no means of knowing how many accidents might have occurred had it not been for some restraining influences. The results have been cumulative, however, and now after a period of ten or more years, during which time experience has shown that accidents do respond to preventive measures, it is possible to gage in terms of reduced frequency and severity rates and in dollars and cents the actual value of organized safety.

In a factory, where the process of manufacture of a product is largely a matter of repetitive movement, and where the worker does not have to contend with widely varying conditions over which he has little or no control, the conditions are different. Such an industrial plant lends itself far more readily to the establishment of safeguards which tend to lessen accidents.

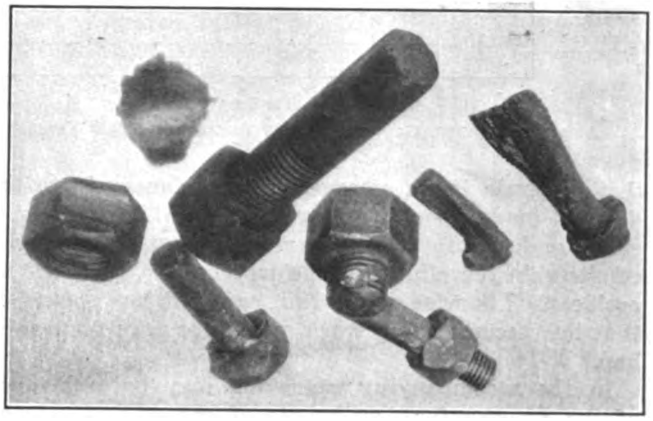
The human element, always the dominant factor in accident prevention, plays an even more important role in the safety program of an electric railway company than in industry.

Mechanical safeguards have but a limited application in street railway operation and consequently a much greater reliance must be placed upon the personal responsibility of the men in charge of the cars.

The motorman who operates a car under the congested traffic conditions of a city today is called upon to confront different conditions every day. Unlike the worker in a shop who is concerned chiefly in his own safety, upon the vigilance and careful conduct of the motorman and conductor depends the safety of all of the persons riding in a street car as well as many in the immediate neighborhood of the car.

While the co-operation of the public may be sought in preventing accidents through bulletins in the cars and such channels of publicity as may be open to the company, the bulk of the burden of saving people from accidental injury is borne by the men who operate the cars. Through a series of messages to the car riding public, the New York State Railways are endeavoring to enlist the help of the patrons of the street cars in reducing the number of preventable accidents. One of these is shown in the car card reproduced herewith. While a number of persons may respond to these suggestions, the inherent tendency of the American to take a chance is so deeply rooted in his general make up that it will require a long and persistent effort to rouse him from his apparent indifference to his personal safety.

Another means which is being employed to reach the public is the contribution of safety articles to the house organs of some of our large industries. Talks on safety before various clubs also serve as a means of awakening the members to a realization of the many thoughtless and really dangerous practices in which they indulge daily. The press gives space to these talks so that the public generally is introduced to itself in a light that may have a tendency to precipitate some sober reflection. The public schools are instilling into the minds of the coming generation the fundamentals of safety so that this problem may be simplified in time to come. The police are co-operating splendidly in our accident prevention activities and their assistance is a big factor in curbing the reckless motorist.



THESE OBSTRUCTIONS ON THE TRACK HAVE CAUSED DERAILMENTS

It is readily seen, however, that if any material progress in accident reduction is to be made, too much reliance cannot be placed upon the co-operation of the public.

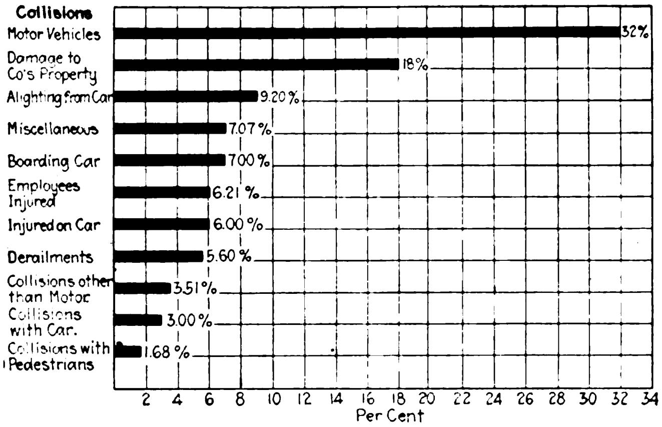
The major portion of the results from preventive measures must come from extraordinary effort on the part of the street railway men. A careful selection of men for positions to which so great a responsibility is attached should be made. It would be manifestly unsafe to the public, to the company and to a man himself to permit a man unfitted physically or temperamentally for a position of motorman to operate a street car.

A man on the front end of a street car must have keen eyesight, good nerves, a good sense of distance and a co-ordination of mind and muscle that will permit him to act on the instant. Again out of consideration of the public, the company and the man himself, no man should be permitted to operate a street car until he is thoroughly competent to do so and has satisfactorily demonstrated to the motor instructor his ability to handle a car safely. He should then be followed up from time to time to see that he has not developed any unsafe habits. Any time spent in better training the new man is well spent, as it is the new man who is involved in accidents far more frequently than the oldtimer.

The conductor, though less able to control the accident situation than the motorman, does contribute to or detract from the safety of the passengers by his actions.

A door opened before the car comes to a stop may mean a fall, or a door closed before a passenger is inside means a smashed finger or worse. A word of caution to an elderly man or woman, eager to get off as quickly as possible to avoid holding the car, may prevent an accident.

Of equal importance to careful men is an equipment that responds in an emergency instantaneously to the demand made upon it. A gong that will not make a sound or but a faint one, or a brake that fails to hold, counteracts the efforts of the motorman to prevent an accident. Likewise a bad rail, one that has spread or that has become badly worn, paves the way for a mishap.



ANALYSIS OF THE CAUSES OF 6,000 ACCIDENTS, NEW YORK STATE RAILWAYS

In the accompanying engraving may be seen some of the reasons for derailments of cars. Each of the objects shown was found on the car tracks in the city of Rochester, and several of the larger ones were responsible for the car leaving the rails. The bolts shown vary in size from ½ in. in diameter to 1¼ in. There are telltale marks on these "derailers" which bear evidence that more than one car passed over them.

After a heavy rain it is quite possible that in a low spot enough water might cover the track so as completely to hide from view an object such as is illustrated. Even though a car might pass over a nut or bolt without being derailed, it is inconceivable that the presence of the object would not make itself known by the jolt as the car passed over it. A motorman who will allow such an object to remain on the track, indifferent to the fate that might befall his follower, is not contributing to the safety of the car-riding public and his apathy may result in an accident which might have been avoided.

The finding of such objects as these on the rails should impress motormen with the need for the most careful scrutiny of the rail and should cause them to be particularly careful in running over track that is covered by water, snow or ice.

ACCIDENT RECORDS ARE ILLUMINATING

Accident records, aside from being necessary to furnish the basis for adjusting claims and bearing witness to the fact that accidents are costly, are very illuminating and full of valuable information to the safety department. They are the barometers of the accident situation and may be employed to serve as mileposts in the progress of accident reduction activities. By representing graphically all of the various classifications of accidents, it may be seen at a glance which of the groups are responding to prevention methods and upon which more strenuous efforts need be expended.

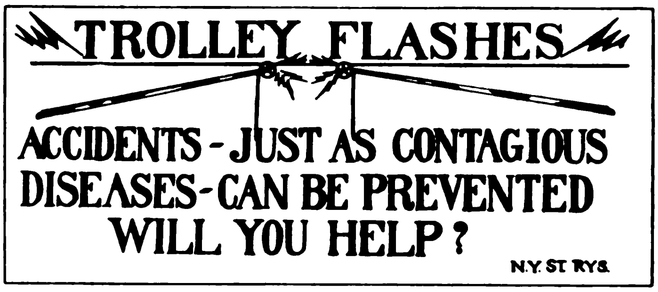
Thus it is possible to deal more intelligently with the accident situation than it is where the situation can be less readily visualized, and avoids also a too general application of the principles of safety. To tell a group of men that a certain classification has increased 10 per cent is not nearly so impressive as to let them observe a sharp rise in a graph which presents the fact to the eye in an unmistakable manner. An analysis of 6,000 accidents, including both serious and minor, brings to light a number of interesting and enlightening facts.

From the accompanying chart it may be readily seen that accidents involving the automobile are by far the most numerous. With the increasing number of automobiles that must operate on streets which are no more numerous or wider than formerly, it is plain that physical conditions are such as to make for an increasing number of motor accidents. Fines have not helped matters a great deal so that some more potent remedy must be found.

A locomotive engineer or a street car motorman is not permitted to operate a train or car until he has been found competent. The movements of steam railroads and electric cars are confined to a given territory, through which their tracks are laid. The driver of an automobile in many cities need pass no examination and may drive his machine wherever and whenever he pleases.

Until the operator's license is more universally adopted, incompetent persons will operate machines, and the number of their victims will not be lessened. All of the blame for automobile accidents, however, cannot be laid upon the motorist for pedestrians in many instances contribute through their own negligence to accidents which need not have occurred.

Next in order of frequency are accidents which cause damage to the property of the company. Although there may be no personal injury the cost of these accidents is no small item and adds to the burden of expense that must be borne by the company.



TROLLEY FLASHES

ACCIDENTS - JUST AS CONTAGIOUS DISEASES - CAN BE PREVENTED

WILL YOU HELP?

N.Y. ST. RYS.

EFFECTIVE CAR CARD TO CAUTION PASSENGERS

Accident frequency alone cannot be used as a criterion of the accident situation. Severity must be taken into account as a very few severe accidents may be far more serious from the standpoint of the effect on the minds of the public, as well as from the standpoint of dollars and cents, than a much larger number of minor accidents.

Nevertheless, every minor accident must be considered as a potential major one, for what may one time be a minor accident, under almost identical circumstances in another case may be a serious one. For this reason no pains should be spared or nothing left undone that might tend to prevent those accidents which may be looked upon as of small consequence.

To be successful, accident prevention must not be considered as a thing apart but should be regarded as part and parcel of efficient operation. It is an operating proposition just as truly as are some of the other problems which are considered as having a prior lien on the time and attention of the operating officials of the railway.

Common sense must govern the administration of a safety department in order to command the respect and co-operation of other departments. Nothing will more quickly make the safety department a target for ridicule and discount its effectiveness than the submission of trifling matters to heads of departments busy with more importants matters. On the other hand, every department head is glad to lend his assistance when worthwhile matters that do concern his department are referred to him.

To compare results achieved by one company with those of another in a city located in a different part of the country may be interesting but no definite conclusions may be drawn therefrom. Local conditions govern the situation in all cases. While certain measures that have proved effective in one locality may be used advantageously in another, it does not follow that the same amount of good will result.

While the saving made by accident prevention activities in actual dollars and cents is one of the benefits to be derived and a very substantial one, some of the by-products are not without considerable value. It is to be expected that as accidents fall off in number, operating conditions improve, there are fewer fill-ins, less abuse of equipment and a higher morale.

The value of courtesy, too, has an important bearing on reducing accidents. Courtesy wins favor from the car-riding public. Even a word of caution, when gruffly spoken, loses its effect. A motorman or conductor who has treated the people who ride on his car courteously has no difficulty in securing the names of witnesses in the event that an accident occurs through no fault of his. The testimony of such witnesses will go far in absolving him from blame and releasing the company from responsibility.

The good will of the public is an asset that is invaluable to any public utility company and one that may be cultivated or destroyed according to the manner in which it is represented by its motormen and conductors.

In conclusion, therefore, the most important considerations in connection with accident prevention are as follows: Safety a policy, not a side issue, careful and courteous men, safe equipment, co-operation of the public gained through various channels of publicity, and everlasting effort.

How to Prepare for a "No-Accident Week"

Much of the Success of Such a Campaign Depends Upon Arousing the Group Instinct, Latent in the Majority of Mankind—Suggestions of How This Can Be Done Are Given in Detail

By Fred M. Rosseland
Chief of the Public Safety Division, National Safety Council

AN EFFECTIVE means of introducing accident prevention work on an electric railway—or of reviving it if it has been allowed to lapse—is to conduct a No-Accident Week! The campaign need not involve the expenditure of any large sum of money, but it does require time—time in the preparatory work, time during the campaign, time of the executives who are directly responsible, and the time of the supervisory force. But the time need not slow up schedules; on the contrary, if well spent it will reflect to the advantage of all involved.

The psychological value of a No-Accident Week is well proved by the numerous drives in this country during the World War. Concerted action of this kind arouses the group instinct, latent in the majority of mankind, and wins by providing a definite objective in the possibility of honor reflected to the company and an assurance of appreciation for the effort. It is an appeal to the individual and group pride of the employee which, properly fostered, is invaluable to the management.

A No-Accident Week furnishes an interesting topic for conversation and discussion between employees of all grades and between employee groups and the supervisory force which can readily be developed into a valuable spirit of loyalty to the company. In a word, it is impossible for a group of individuals to work together intensively even for a week on a no-accident drive without developing a new regard, a new appreciation, a better understanding of one another.

In the following outline of preparatory work, I shall refer to the person in charge as the general manager, although the superintendent or general superintendent or a vice-president may have the responsibility for the campaign.

Having made the decision to conduct a No-Accident Week, the general manager will first arbitrarily select the week or he may refer this question to a special committee of his assistants. In either event the date chosen should allow at least two weeks for preparation. Three weeks would be better. The No-Accident Week may properly start at midnight on one Sunday night and continue until midnight the next Sunday night, a period of seven full days. Then the executive committee should be formed, to consist of the general manager as chairman and the four or five principal department heads of the organization. If a complete safety organization is in operation, this committee may be dispensed with and its duties given over to the central safety committee.

The executive committee should arrange to secure from the claims department, or the accounting department, the accident record of the company for two or three weeks preceding the No-Accident Week and for the corresponding week in the preceding year or two.

Plans should be made to hold a safety rally of all employees—divided into groups, if necessary—during the week before the no-accident campaign. These meetings should be addressed by the general manager or by the head of the particular division employing the men present at the meeting. The speaker should tell simply and forcefully what the company proposes to do, what the accident record has been and why the campaign is to be held. In closing, he should solicit the support and co-operation of every employee to make the campaign a success.

At these meetings signed pledges should be secured from every employee. The following pledge is suggested:

X. Y. Z. TRACTION COMPANY,
OMAHA, N. Y.

NO-ACCIDENT WEEK
Aug. 7-13, 1922

I am heartily in accord with my company's Accident Prevention work, and I will make a special effort to prevent accidents of all kinds during No-Accident Week.

(*Signed*) ....

(*Dept.*) ....

The dispatchers and supervisory force should be instructed to greet every employee with whom they talk on company business with some such phrase as "Remember, no accidents this week!"

A special letter to be signed by the general manager should be prepared to be mailed or handed to every employee just before the No-Accident Week begins. The letter should read something like this:

TO THE EMPLOYEES OF THE X. Y. Z. TRACTION CO.,
MY FRIENDS:—

Beginning at midnight next Sunday night, this company enters on a No-Accident Week, during which we hope not to have a single accident in which our cars or equipment are involved. To win out, we must think and act safely!

Some of us may thoughtlessly take chances to make up time, to finish a job quickly, or for some other reason, but we must stop taking these chances. If we all exercise every reasonable precaution to prevent accidents, chargeable to our negligence or carelessness, during No-Accident Week, the results will be a saving of pain and loss that we may well be proud of. The company asks every man to do his duty to prevent accidents to make the No-Accident Week an unquestionable success.

I know that you are with us and that you will work with me to make our record perfect.

Sincerely yours,
General Manager.

Each day during the campaign—after the first day—every motorman and conductor (or at least each crew) should be given a card or slip showing the record made the day before, together with a record for the week to date, bearing a one-line slogan or one sentence of encouragement such as:

"Do more than ring your bell. Slow down or stop, if necessary."

"Your co-operation is showing results. Thank you!"

"Don't wait for an accident to happen. Report the danger now."

"It pays to be careful. The more careful you are, the better it pays."

"It would be a disgrace to us if we did not give the best that is in us to prevent accidents."

"Careful folks seldom are unlucky."

"We are doing splendidly. Don't let any act of yours spoil the record."

"When caution becomes a habit, accidents will be few."

"It is your co-operation that is making the No-Accident Week a success. Let's keep it up!"

Each day the accident record of the week to date should be posted on the bulletin boards at the division points where all employees may see it. This record should show in comparison the record of the previous week and also of the previous year. These notices should have slogans, words of commendation or encouragement.

If the record is clear for the first two or three days, it is advisable to hold additional mass meetings of employees to "pep them up" and inspire them to continue the effort.

ATTENTION TO ADVERTISING IS ESSENTIAL TO SUCCESS

Preparations should also be made to give due publicity to the No-Accident Week campaign in the newspapers of the community served by the traction company. It is vital that all the safety committees—central, divisional and subordinate—be definitely lined up in the campaign and especially delegated to inspire their fellow workers to continue co-operation during No-Accident Week. It should be suggested that the subject of the no-accident effort be constantly brought up in conversations and every effort made to make it the most important activity of the organization.

Many National Safety Council members conduct an advance advertising campaign among their employees during the week or ten days preceding the opening of the week. For example, on the first day of the advance advertising campaign a large letter N is painted or posted on bulletin boards throughout the company. On the second day a large letter A is added. The third day the large letter W is added. The three letters are then allowed to stand for twenty-four hours. Then the date of the No-Accident Week is set up thus:

N A W
August 7-13.

This is allowed to stand for three or four weeks and then the letters N A W are removed and in place of them are inserted No-Accident Week, the first letter of each word being capitalized to indicate that they are the same letters previously posted. The next day the same copy, just described, is removed and replaced in smaller letters, and in large letters something like the following is placed beneath:

"For the Honor of the Company"

or some similar slogan, which may be changed daily until the actual opening of the campaign or until the end of the No-Accident Week. This idea, which may be adapted and enlarged upon, will most assuredly add "pep" to the whole affair.

It is advisable to use safety bulletins freely during the two or three weeks preceding the No-Accident Week and during the week of the campaign itself. Many such bulletins may be obtained from the National Safety Council by its members, and home-made bulletins developed on the property are easily prepared at small expense.

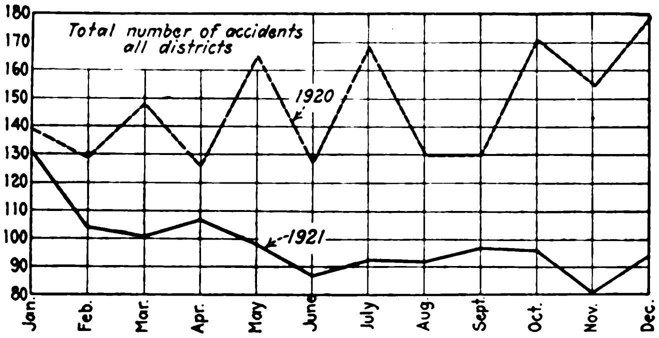
With these preparations made and the recommendations carried out in the proper spirit, a No-Accident Week should be successful. Executives, however, bear in mind that even though a perfect score—not a single accident during the week—is not attained, the week should be considered a success if a substantial reduction is made in accidents compared with the average for the year and with the corresponding week of the previous year.

Conducting Safety Work on a Business Basis

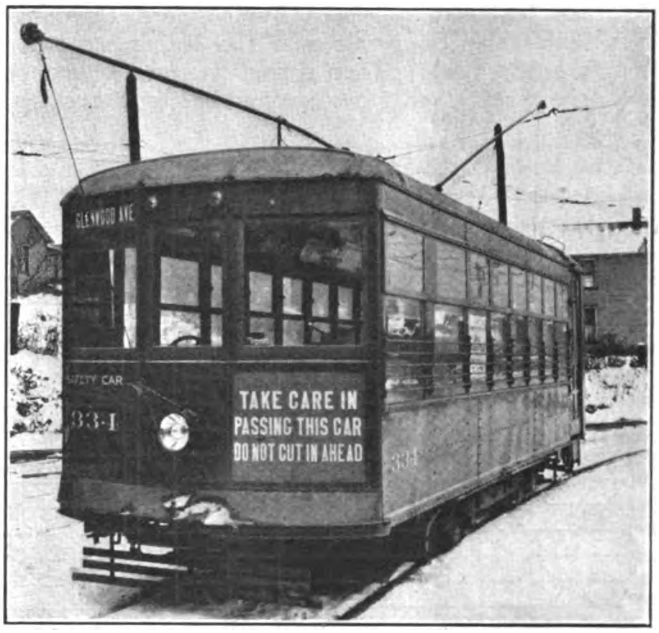
Quiet Study and Effort, Without "Hoorah" Meetings, Prove Very Effective in Youngstown—Solemn Hearing on Every Accident Has Important Influence—Work Conducted on the Theory There Should Be No Accidents Whatever

PREVIOUS to the present plan of conducting safety work on the railway properties of the Pennsylvania-Ohio Electric Company, Youngstown, Ohio, several sporadic attempts have been made to accomplish the desired end by means of a lot of "hoorah" meetings designed to stimulate enthusiasm. But each time the effort has been of temporary benefit, for it was impossible to keep up the interest. When G. T. Seely, vice-president and general manager, undertook to revive the safety work last year, a simple organization was effected, and the work started out in a very quiet way without any attempt to have big meetings or create padded interest. The work has simply consisted of a quiet, consistent plugging for greater caution and an effort to rid the property of dangerous equipment and bad practices.

The organization to handle the safety work comprises a central safety committee and nine local or "intermediate" committees—intermediate between the individual employees and the central committee. The central committee comprises the general manager and various department heads. It meets regularly once a month. Any individual may make a safety suggestion to a representative from his department who is a member of one of the intermediate committees and this committeeman can dispose of a good many of the suggestions, that is, put them in effect without carrying the matter any further. The intermediate committees also meet once a month to consider the various recommendations made as to improving safety. These committees make their recommendations on anything that cannot be done and forward them to the executive committee of the central safety committee. This executive committee is a subdivision of the central committee comprising the general manager, manager of railways, the secretary of the company, and the manager of the light and power department. If a proposal is approved by the executive committee, the work is ordered done and the local committee, and through it the individual, advised as to the action taken. If action is not to be taken immediately, information is given as to why it is postponed and when the work will be done. Any matter which is turned down by the executive committee is sent up to the central committee at its monthly meeting, which considers the question and either confirms the decision of the executive committee or approves the suggestion.



GRAPHS OF TOTAL NUMBER OF ACCIDENTS IN 1920 AND 1921, PLOTTED BY MONTHS AND SHOWING REMARKABLE IMPROVEMENT



DASH SIGN WARNING TO AUTOISTS ON PENNSYLVANIA-OHIO ELECTRIC COMPANY CARS

The advantage of the executive committee is that it provides a means of giving immediate attention to the great bulk of the suggestions made, without waiting for the monthly meeting of the entire central safety committee. Any steps requiring the expenditure of money or requiring a work order must be approved by the central committee of which the general manager is chairman. Nothing is finally turned down until it goes up to the central committee.

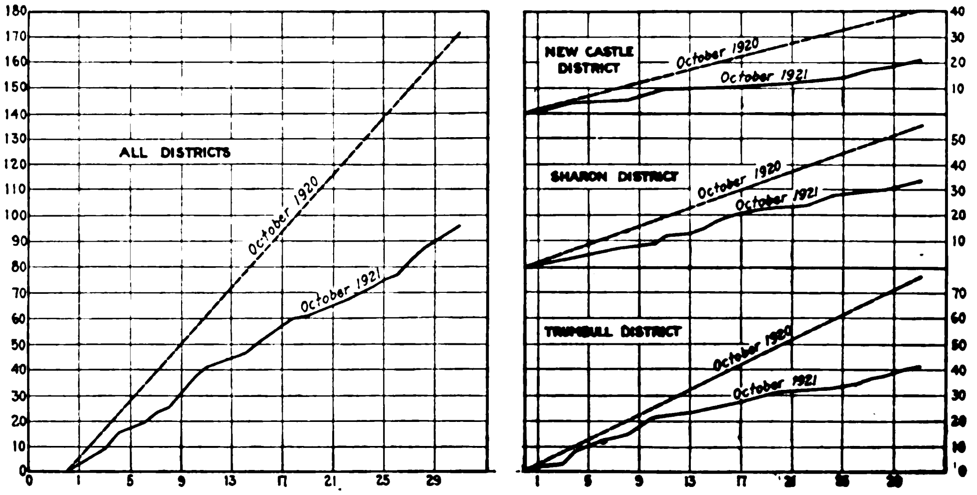
The members of the intermediate committees are selected by a popular ballot of the employees, the election taking place in all departments every six months.

A similar safety organization and scheme of conducting the work is in operation on the Youngstown Municipal Railway, which has a separate operating organization but is also under the management of Mr. Seely. For the entire system, the Pennsylvania-Ohio electric and railway properties and the Youngstown Municipal Railway, the number of safety recommendations received and the action taken during the years 1920 and 1921 were as follows:

INTERMEDIATE COMMITTEES	
Number of safety recommendations received	843
Number approved	660 or 78 per cent
Number not approved	117 or 14 per cent
Number pending	66 or 8 per cent

CENTRAL COMMITTEE	
Number of safety recommendations received	233
Number approved	169 or 73 per cent
Number not approved	38 or 16 per cent
Number pending	26 or 11 per cent

One thing which has undoubtedly contributed very materially to the good record made during 1921 in reducing the number of accidents, as shown in the accompanying curves, is the fact that a hearing is held on every accident. This hearing is conducted with great solemnity either by the manager of railways or general superintendent. A stenographic record of the proceedings is made and the whole conduct of the hearing is much the same as it would be in a court. To submit to this investigation and cross-examination is not a thing that any trainman relishes. Furthermore, there has been remarkable co-operation of the trainmen's union in this safety work. When a man has an accident he not only must stand investigation before the official board, but he must answer to his fellow trainmen, who "razz" him pretty hard because of their efforts to make the accident record of their division show up better than the record for the same period of the previous year and better than the other divisions of the company. Although no reward of any kind is made to the trainmen, the competitive spirit runs high. Each month the curves showing the number of accidents on each division are posted at the various division headquarters, so that the men can compare the results with their own work and with that of the other divisions.



LEFT—TYPICAL SET OF CURVES OF CUMULATIVE DAILY ACCIDENTS FOR THE ENTIRE PROPERTY POSTED MONTHLY IN DIVISION HEADQUARTERS AND SHOWING IMPROVEMENT OVER CORRESPONDING MONTH OF PREVIOUS YEAR. RIGHT—TYPICAL ACCIDENT CHART FOR THE THREE DIVISIONS DISPLAYED IN EACH DIVISION HEADQUARTERS TO KEEP TRAINMEN ADVISED OF DAILY RESULTS

Another part of the follow-up on accidents which has proved very effective is the plan of having each accident reviewed before the monthly meetings of the local safety committees. Reports on the accidents happening during the month are read, and the cause and responsibility pointed out. In this discussion it is brought out what trainmen are responsible and how much the accident cost the company.

The safety work is somewhat intensified by bringing in the influence of an outside man. A man from the Safety Bureau, Chicago, spends one week a month on the property and works with the local committees, talking over their suggestions, telling them how to carry things out, and giving them encouragement on the importance of the work. The men look up to him more than they would to an employee of the company because he is considered an expert on the subject and they respect what he says. His week culminates in the monthly meeting of the central safety committee.

A very large proportion of the accidents which the company has been experiencing are the result of automobiles hitting the street cars or cutting in ahead of a car. A campaign to induce greater care on the part of drivers has been carried on by painting a sign on the dashes of the cars, so located as to be on the right-hand side on the rear end. Some such admonition as the one shown on the car reproduced herewith is painted in large yellow letters on a red background, this combination making the message stand out very prominently. Several different warnings are employed all urging the use of care in approaching and passing street cars.

Another point in the psychology of the safety work in Youngstown is that the management takes the attitude that there should be no accidents whatever. It realizes, of course, that some accidents will happen, but it does not recognize this as a philosophy, and instead endeavors to impress on the men the idea that if the cars were operated right, there would be no excuse for any accident.

The safety work of the company on the present plan started in January, 1920, but a better showing was made in 1921 than during the first year, probably as a result of the cumulative effect of the effort. The curves reproduced herewith show a comparison of the daily cumulative accidents for a typical month — October, 1921 — as compared to the cumulative average for the same month of 1920, for the New Castle, Sharon and Trumbull districts, and for the entire property. A fifth pair of curves shows the total number of accidents by months for the year 1921 as compared with the total for 1920, from which it will be noted that the safety work is bearing fruit abundantly. The results of the safety work over the entire year 1921 showed a reduction of more than one-third in the number of accidents as compared to the previous year. The actual figures are as follows:

	1921	1920	Decrease
New Castle district	269	403	33.2 per cent
Sharon district	448	660	32.1 per cent
Trumbull district	458	704	34.9 per cent
Total	1,175	1,767	33.5 per cent

There have been other influences at work besides the accident prevention activities, to be sure. Some of the decrease in accidents must be attributed to the fact that a somewhat smaller number of passengers was carried, although the car miles operated increased slightly, due to the introduction of Birney safety cars on the city lines in the New Castle and Sharon districts in place of larger cars. The Birney cars in themselves and new interurban cars of the Peter Witt type in the Trumbull district contributed materially to the reduction of accidents. Nevertheless, in the opinion of Mr. Seely, the fact remains that in the cutting of accidents nearly in two in the period in which organized safety work has been carried on, much of the showing, probably the major part, must be attributed to care in operation, to interesting every employee in the cause of safety, to consistent, quiet, unremitting accident prevention work.

Teaching Safety to Children

Portland, Ore., Takes a Leading Position in Safety Instructions for School Children—There Is an Active Division of the National Safety Council and a Variety of Plans Is Followed

THE city of Portland evidently believes in the old proverb to train a child up in the way he should grow, and when he is old he will not depart from it. It has been customary for ages to speak of a child as being heedless, but many of the school children in Portland, thanks to the Oregon & Columbia Basin Division of the National Safety Council, assisted by the Portland Railway, Light & Power Company, are much less heedless than the adults.

The Oregon & Columbia Basin Division of the National Safety Council is an organization made up of the large industries in Portland who contribute to its support on the basis of 5 cents per employee a month. The Portland Railway, Light & Power Company is a member, and B. F. Boynton, its claim agent, is a vice-president of the organization. The city of Portland and the Chamber of Commerce contribute lump sums to the support of the organization, as does also the railway company. Some of the results obtained among the school children are shown in the accompanying table. While there has been an increase in the number of automobiles registered in the state and city as well as an increase in the school attendance, there has been a marked decrease in the number of accidents to school children.

Through action by the Oregon Legislature at its 1921 session a very practical impetus was given to the stimulation of educational work in accident prevention by employers. The state has a workmen's compensation law, as well as a state industrial accident fund and an industrial accident commission. The action of the Legislature was to pass two important amendments affecting the employers' contribution to the state industrial accident fund. These provisions became effective July 1, 1921, and provided a reduction of 5 per cent from each monthly payment required by the act to the fund, provided the employer followed certain rules of the commission designed to promote safety organization and educational work and accident prevention. These rules are along the lines followed by the National Safety Council, so that automatically each member of the council receives a refund of 5 per cent on his contribution to the accident fund, if he lives up to the rules of the coun-

THE PORTLAND COMPANY BELIEVES GOOD RESULTS CAN BE SECURED BY BILLBOARD SIGNS cil. The other amendment was to provide another rebate for those employers having a small number of accidents and an added rate for those having a large number of accidents.

A number of ways were followed to stimulate interest in safety in the public schools. One was the chart with paper disks illustrated in the accompanying engraving. This was placed on the bulletin board of each school with the name of the school printed on it. Red paper disks, to be pasted on the chart, are provided to represent accidents in traffic during the twenty-four hours. These disks are printed with the name of the school and the date of the accident and are pasted in the circular spaces provided in the upper part of the chart. Three are shown on the chart reproduced. There are also yellow disks to represent accidents on the playground during school hours only. A school that has an accident places a red disk in the upper row on the chart, while in the other schools the red disk is placed in one of the lower rows. If no accident to any child attending a school is reported during the month the school having this clear accident record is entitled to a green or safety disk, placed in the lowest row on the chart. There are ten spaces in this row, one for each month of the school year.

SAFETY CARS WITH SAFETY FIRST SIGNS ARE RUN FREQUENTLY ABOUT THE STREETS

An active interest in accident reduction is thus established among the children, and the bulletin board at each school is scanned every day to see that that school has been free from accident. This interest has created an endeavor among the pupils to keep the red disks off the chart.

To provide a definite organization, safety committees have been organized in each school, and buttons given to the members of these committees to distinguish them. A "safety patrol" was also organized among the boys, preference being given in the selection of the members of this patrol to the boy scouts. These boys wear green cloth arm bands, marked "Safety Patrol," and are detailed at the street crossings to assist in getting the little children across in safety and to report automobiles which violate the ordinance relative to passing schools except at reduced speed during the school period.

The duty of the safety committees is to read the school bulletins in their rooms each week and to lead discussions on safety topics. These committees meet once a week under the supervision of a teacher, and once a month the manager of the public safety section of the Safety Council meet with the children. Two assemblies of all pupils are held twice a year, spring and fall. In addition, there is a rally for the safety committees in May, and at the last meeting more than 1,000 children were present. A safety play was given by the pupils of a grammar school, and there were fire prevention exercises and short talks by city and school officials. The pupils then together took the safety pledge:

> I pledge myself to help advance the cause of safety; to do all I can to prevent injury and death to my playmates and myself; to make myself my brother's keeper and thus decrease the amount of suffering, death and sorrow in the world.

The work of the safety committee in the public schools is not confined to reduction of accidents on the streets. It includes other causes of casualty, including fires. Several fires occurred in the schools during the past year, all starting among the shingles on the roof, and one building in which nearly 700 pupils were housed was destroyed, but at the sound of the fire alarm the pupils were out of the building in forty-five seconds.

The railway company has taken an active part in this entire campaign, having done considerable work before

Membership of safety patrols			220	

the Safety Council was organized. Prizes were offered for the best paper among the children on "The Prevention of Different Types of Accidents." At one time 50,000 blotters printed with different "don'ts" on them were distributed through the schools. At another time the reminders took the form of small celluloid calendars with the list of "don'ts" on them, and on another occasion the children received "safety first" buttons which they could pin on the lapels of their coats. At one time it seemed as if nearly every child in Portland was wearing one of these buttons.

A statement of the safety campaign in Portland would be incomplete without something about the work done by the Portland Railway, Light & Power Company among its own men. Its first, and perhaps its most effective, work is among its new trainmen after they had been broken in and before they are allowed to operate their cars. On a certain day each week all these men are brought in to be instructed along the lines of safety and also what to do when accidents occur. Prizes have also been offered to the men for the best paper on the prevention of different types of accidents, and these prizes have been in cash. A portrait of the prize winner was then posted in the particular carhouse where the employee worked.

Safety talks are given in the company paper, placards are posted in the shops, carhouses and substations, and safety signs are carried on every car. Metal watch fobs with a safety warning on them have been presented to each motorman and conductor. Safety committees have been organized at the different carhouses, and occasionally means of furthering the safety idea are discussed with the safety committee over a dinner. Cars carrying safety first signs are operated through congested districts in the city, and safety first signs are carried on billboards throughout Portland. Illustrations are given of these.

An effort is now being made in Portland to have a more rigid test for automobile drivers' licenses, as it is felt that many accidents have been caused through the operation of automobiles by men and women who mentally are not qualified for this responsibility.

Accident Reduction in Los Angeles

The Safety Bureau Was Begun on the Principle that Carelessness Causes More Accidents than Want of Knowledge—The Men Are Thoroughly Drilled to Be Careful and Watch Out—Excellent Results Are Already Being Secured

BY JOHN C. COLLINS
Supervisor of Safety, Los Angeles Railway

IN PROBABLY no other city in the United States is the hazard of accidents involving street cars so great as in Los Angeles. It is true that Los Angeles does not have many days when the streets are slippery, but for that reason drivers of vehicles are not familiar with those conditions when they do occur. The automobile traffic is dense, both in the center of the city and in outlying districts, because every day of the year is an out-of-door play day in Los Angeles for those who have time to take advantage of it. In most Eastern cities automobile traffic is less during the winter months, but in Los Angeles it is almost twice as heavy in winter as in summer.

Several years ago I was engaged by the Los Angeles Railway Corporation to study the question of how the different types of accidents might be reduced by better instruction and other work among the trainmen. I found many angles to this question—type of men, different nationalities, frame of mind, etc.

As an experiment I started two years ago to work on a man who was less than twenty years of age and had had no previous experience with cars or automobiles. When he had learned to start and stop a car smoothly, I instructed him in safe operation along special lines with the idea of keeping him from having an accident for which he was to blame. When I thought he had formed the habit of doing what he should, he began at the foot of the extra list and has now worked up to a regular position on one of our main lines. In these two years he has not let any part of his car hit anything, nor made a report of a step accident. This is much more than I would expect from any man.

Another experiment was with a different type of man, more reckless and an auto driver thirty years of age, who had been instructed in the regular way. When he could operate a car, I went over the accident question very thoroughly with him in the office. He has been running cars almost ten months without an accident.

All this has proved to me that with men properly trained accidents can be avoided; that carelessness causes more accidents than want of knowledge, and all that is needed is to work on the man's mind—to get him to think. This may take time, or some reward may have to be offered to him for thinking and a penalty assessed for not thinking.

SAFETY BUREAU STARTED

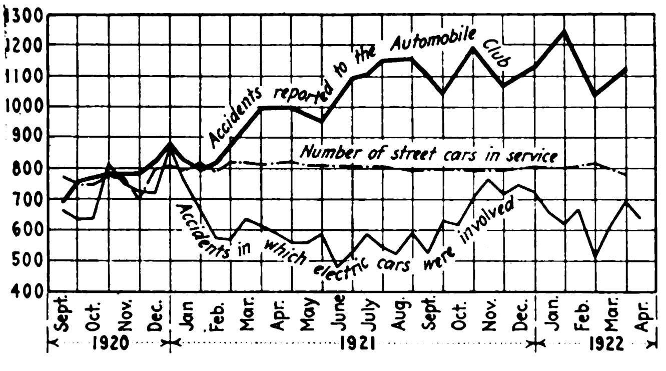
The Safety Bureau of the Los Angeles Railway Corporation was started Oct. 1, 1920, with this foundation —that any man, no matter how good, might have an accident, but that no man need have one for which he was to blame. By eliminating the accidents for which they are responsible, the men do away very largely with the so-called "unavoidable accident" as well.

In our weekly paper, *Two Bells*, we carry a series of short articles dealing with accidents, each class of accident being covered before another is started. The heading each week calls the attention of the trainmen to changes at some particular place, or to the fact that they are getting careless in observing some rule, jumping from one thing to another to get them to think. This is for general results and, in the language of the trainmen, worded so that the poorest man in the service can understand it, for he is the one that needs it the most. We present conditions just as the men meet them every day.

Every new motorman starts cautiously. As he gets acquainted with the other men and more familiar with the controller, the air and the lines, he is apt to become overconfident before he has had the practical experience necessary to guide him. After a while he settles down to street car operation, learning from experience that taking chances does not pay. We are trying to keep the new man from going through the overconfidence period by giving him the benefit of our experience. They say a thing cannot be done. We show them it can and more easily than they have been doing the old way.

We give no bonus for safety, although a man receives credits for each month he has a clear safety record, and demerits are assessed for accidents wherein he is to blame. This affects his standing when the yearly bonus is awarded. This bonus is based on the man's general record each month and is paid in a lump sum on Dec. 15 of each year.

We conduct a contest among our divisions, the winning division receives a safety pennant which it retains until some other division wins it. The duration of the contest was originally for ten weeks, but we find this is too long a time, the divisions falling behind losing heart as well as interest. In order to keep up the interest, we decided it would be better to have a vacation from April to October, then hold six contests starting Oct. 1, each contest ending with the month. The first five will be based on responsibility, the sixth one on the total number of accidents. While the contest is on each division is kept informed every day relative to its standing. We let the division superintendent use his own method to encourage the division spirit, as he should be better acquainted with his men and conditions more than any other man. He is given a free hand, so he cannot say that he was interfered with.



RELATIVE NUMBER OF AUTOMOBILE AND STREET CAR ACCIDENTS

This chart shows the increasing number of accidents reported to the Automobile Club of Southern California in which automobiles are involved, the decreasing number of street car accidents and the total number of street cars.

In this contest first place changes many times. This shows the men are interested and fighting. We have a trained man who looks over the files and places the responsibility without knowing the name of the man who had the accident, or his division, so there is no chance that one will be favored over another. We have a chance to recheck after the claims department has made its investigation or settled the claim.

We have not enlisted in a safety week contest, but work to that end the year around, devoting our attention particularly to the following six general types of accidents: Rear end collisions with cars or vehicles, steam railroad crossings, electric switches, curves, cross streets and the boarding or alighting accidents.

Road space is our main strong point working against collisions with any object ahead. It would take a fair size book to go into details of the plan. In an article like this I can give only a few ideas of the plan.

To explain road space it should be explained that the city is divided into two zones. No. 1 is the congested district and No. 2 is from the edge of the congested district to the terminal. In part of No. 2 zone, three or or four different lines run on the same track, then separate to go over their own routes. While running at full speed in this zone the cars must not operate closer than 600 ft. from one another. If the leading car stops, the motorman of the following car must throw off power immediately and approach the car in front with a decreasing speed, making a full stop 100 ft. back of it and remain there unless signaled to close up by the crew of the leading car. If signaled to close up, the motorman of the second car must not use more than five points on his controller and must stop 10 ft. back of the leader. This not only does away with rear end collisions but enables the men to coast a great deal with their cars under better control at dangerous places and does away with a great many unnecessary stops.

The Los Angeles Railway pays considerable attention to the enforcement of this rule. Each new man is thoroughly instructed in it, and this instruction gives him a foundation to work from in No. 1 zone, or when any objects, such as track intersections, curves or other cars, are ahead or there are autos standing on or near the tracks.

When a car is following an auto, the same road space is used as when a car is being followed except the distance is somewhat shorter, depending on the speed, but the safety stop is always in reserve. The idea is not so much to scare the autos off the track as it is to stay from them while they are on the track. We are working with the police and the Automobile Club of Southern California, trying to show them they have a responsibility as well as ourselves.

DETERMINING RESPONSIBILITY

The accident reports, which are made out in much better shape, go to the claims department, where they are looked over and passed to the Safety Bureau to be analyzed. We have a man who is an expert at placing responsibility, using the law of the last clear chance. On a large chart he shows the total number of accidents and the responsibility. The chart is by months and covers the year, shows who is responsible, division, line, type of car, kind of accident, place, time of day and length of service of the man who had the accident. This is entered by code numbers. From this chart we can get almost any information we wish. It is interesting to look over, as each month shows things not expected. For the start we used everything we thought might be useful, so we could cut later to what we needed.

Then we have an individual record card, trainman's name, age, division and when he entered the service. Every accident a man has is entered by code number on this card, as well as the type of accident, who is responsible and the degree of responsibility. No other record is made on these cards, except notes of our observation of the man's work and those received from the instruction office or supervisors.

These notes are for our information when we interview the man. When the clerk enters an accident on the record card he also looks it over. If the trainman is having too many accidents, although not to blame, or has had one where he was to blame, a yellow tag is placed on the top, so the card can be picked out at a glance. If we consider it desirable we look the man over on the road, and if we instruct him the yellow tag is replaced by a green one. If the man does not respond to instruction or continues to have accidents, a red tag replaces the green one, and the man is under closer observation.

When a yellow tag is placed on a card it is called to our attention. If the man is having more than his share of accidents, though not to blame for them, I know I will find a careless man.

There are two general types of careless operators, widely differing from each other. One is of fine texture, neatly dressed, shoes polished, hair trimmed, cap slightly to one side of his head and decorated with a flower. Most of his attention is on himself and lady passengers, very little on his work. The other is of coarse texture, doing rough work, careless about his personal appearance, shoes not polished, hair not trimmed, shaves probably twice a week, collar changed when he shaves, uniform dirty, just naturally careless all his life about his personal appearance and other things as well. I call their attention to their carelessness just to let them know we have an eye on them. They usually snap out of it then.

If checked with full responsibility, a red tag is put on the card and an appointment made for this man at the office for an interview, twenty minutes being allowed to each man. We accomplish a great deal of good at these interviews. Naturally we have looked up the man's record card and the file of his accident. After an explanation we may cut down the degree of responsibility on account of extenuating circumstances. This is very seldom, however.

We use no pictures but draw on a piece of paper the relative positions of the car and the vehicles, or what the nature of the accident happened to be, talk the accident over, explain the six types of accidents that we wish the man to avoid, giving him something to think about. This is partly routine.

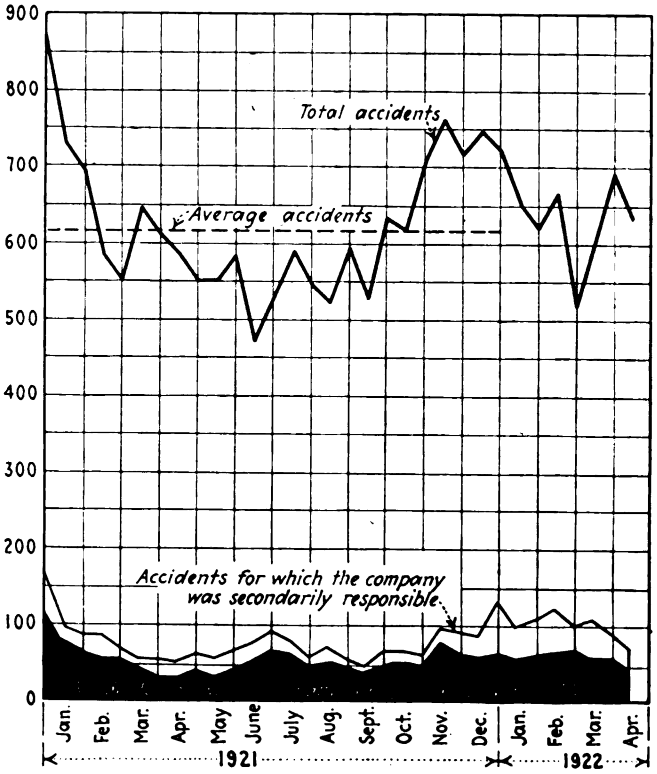
The type of man may change the conversation. If he is young and of the blond type, I try to show him that he is not a good gambler. Most of this type think they are. I show him that a good gambler might put up $5 to win a $25 jackpot but would not put up $5 to win a 25-cent one, and the chances he takes are like those taken by the latter type of gambler. Then I prove it to him.

The accident may show the trainman to be a poor observer. If so, we go about it from that angle. We tell him that a motorman must have good eyesight, smooth muscular action and a moderate degree of caution. Care must be taken in talking to a man of this type that in inculcating a spirit of caution his courage is not taken away. Instead he should be shown that he should be able to observe without concentrating his sight on any one thing.

He should look at nothing, but see everything. By looking steadily at one object, a person will soon shut out all surrounding objects. By looking ahead for different combinations, blind streets or alleys, his mind is more alert, his muscles are more active, his attention is scattered so he will see everything, and he is more likely to see the unexpected, recognizing it instantly. The co-ordination between the brain and muscles is such that he is more likely to act than to debate. The object of this is to get the man to think, to keep him more interested.

Take a man who is careless at heavy track intersection. First I show him his responsibility to his passengers; then where the danger comes from, where to look and when to look. In this manner, if a man is about to cross a crowded street, as he steps from the curb he looks first to the left for vehicles or cars coming from that direction. When he nears the center of the street he looks to the right, because he is going out of one danger zone into another where traffic is moving in a different direction. This glance is taken with no lost time, but must be taken in time.

We sometimes change a motorman over to the back end as a conductor, but I do not recommend changing a conductor to the head end. After a man has worked for any length of time at one thing his mind is drilled on that kind of work.



ELECTRIC RAILWAY RESPONSIBILITY CHART

This chart shows the classification of accidents as regards the responsibility of the company.

A great many of our auto accidents can be traced to the fact that the business man does not leave his office behind him when he starts driving his machine. For years conductors have had the car stop with no effort on their part except giving the bell. In consequence, a conductor as a motorman is subject to "eye" attention or lapse of attention. There is sure to be a time that his mind is that of a conductor, while he is acting as a motorman. He will see the danger and wonder why the car does not stop, not thinking in time that he is the one to stop it.

After six months work along this line, although only two-thirds of the plan is in operation, we see results. The chart showing automobile accidents and the line showing street car accidents are drifting apart, autos going up and cars going down.

We find a man always cuts his accidents down after we have talked to him. Each man tagged by a yellow, green or red tag was having from two to six accidents a month, though most of them were slight and there were many where an auto ran into the car.

An accident, no matter how slight, that might develop into a claim, calls for an accident report. It is cheaper to use paper than to investigate a blind case. In looking over the record cards at the end of the first six months we removed the tags from the cards showing a clear accident record for three months. Remember, these men were considered the worst. We removed twenty-eight red, eighty-three green and 141 yellow tags, making a total of 252 tags. Of these men 151 were interviewed in the office, the others on the road.

Three months of clear accident record is exceptionally good. Some tags were not removed from other cards, but each case showed a decrease in the number of accidents, and all of a much slighter nature. A great many of our men now have a clear record for the six months. That is remarkable, considering what a motorman has to face on the congested streets of Los Angeles.

The men having three months or more of clear record are recommended to the superintendent of operation for credits to offset any demerits they may have received.

If we could have kept our accidents from increasing we would have shown a big gain, but we have actually decreased them, though the hazard is much greater than heretofore. The city has doubled in the last three years, and it is almost impossible to keep up with its growth. The holiday season put the operating department to a severe test, but there was no serious accident.

We have had only two serious accidents since starting this work. Both cases involved men we had not seen because they had just entered the service, and the accidents happened during a storm at night. Both were cases of man failure, though fortunately with no serious injury.

The rest of the plan concerns the instruction department chiefly through its line instructors. We did not want to start that angle until about June, so said nothing about it, as managers and superintendents the world over are anxious for results, and the more results they see the more they want. They are liable to shoot all their ammunition away with one shot, when it should be spread out over a long period of small shots.

A purely educational move affecting habits of long standing requires time. We have been operating for years with very little attention of this kind paid to the accident. Six months more will make very little difference. We must keep the men interested long enough for them to form the habit of thinking so that they will do it as part of a habit.

A doctor has to study for years to be able to save people from pain. We can save lives with one year of study just as surely as a good doctor can. I am confident that in a year we shall build up the safety organization of platform men on surface lines in the country. The men from all departments are more interested in this work, with better co-operation between heads of departments, closer and more friendly feeling between automobile club and police department and the Los Angeles Safety Council. In time they will all "Watch out."

The man who interviews the men should be a practical man with road experience, not a superintendent or claim agent, but he should be closely connected with both. The men put up a stiff fight sometimes. The interviewer must be able to beat them by showing them they do not think and prove it to them. By right thinking no one need have an accident.

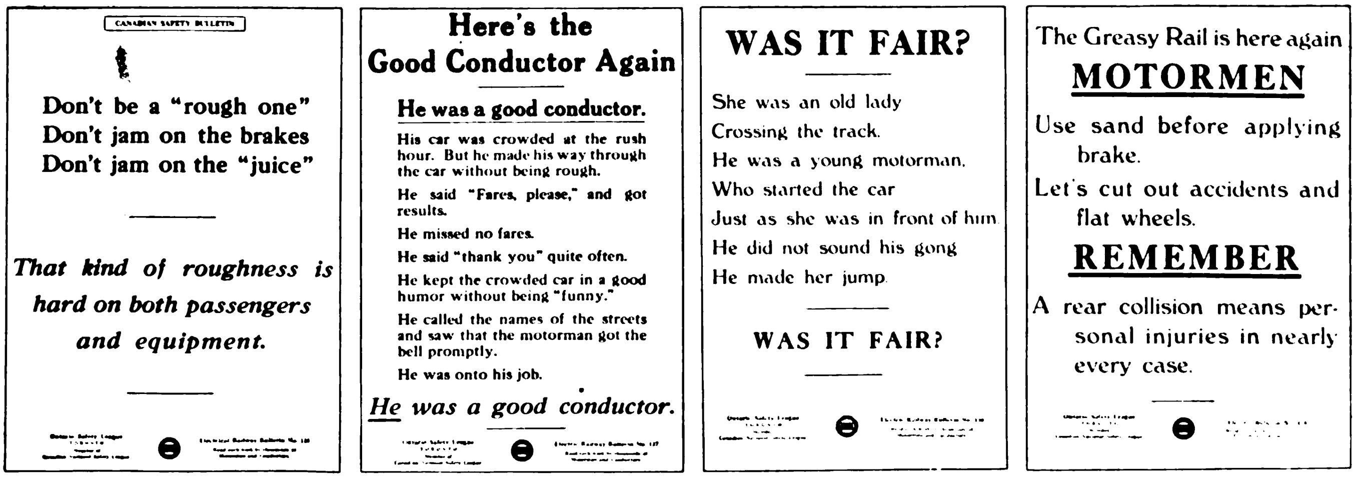
INDIVIDUAL EMPLOYEE RECORD CARD

A card like this is kept for every employee. The first column gives the number of the accident file; the second, the date of the accident; following four columns, the nature of the accident in code; the final column filled in, the responsibility of the operator, e.g. 10, 20, 30. The dash indicates no responsibility and the "X" mark that the car was standing still at the time of the accident.

We see the results by looking over a man's record card every three months. Each accident called to our attention is treated on its own merits, for conditions may be such that make it different from any other that has ever happened.

We do not know how many accidents we have prevented or how serious some of them might have been, but we do know we are saving property from damage, people from injury, and people's lives. We cannot tell whose lives we save, and it is not spectacular enough to draw a Carnegie medal.

To keep from hurting some one, be careful; to keep from getting hurt, "Watch out."



CANADIAN SAFETY BULLETIN

Don't be a "rough one"
Don't jam on the brakes
Don't jam on the "juice"

That kind of roughness is hard on both passengers and equipment.

Here's the Good Conductor Again

He was a good conductor.

His car was crowded at the rush hour. But he made his way through the car without being rough.

He said "Fares, please," and got results.

He missed no fares.

He said "thank you" quite often.

He kept the crowded car in a good humor without being "funny."

He called the names of the streets and saw that the motorman got the bell promptly.

He was onto his job.

He was a good conductor.

WAS IT FAIR?

She was an old lady
Crossing the track.
He was a young motorman.
Who started the car
Just as she was in front of him
He did not sound his gong
He made her jump

WAS IT FAIR?

The Greasy Rail is here again

MOTORMEN

Use sand before applying brake.

Let's cut out accidents and flat wheels.

REMEMBER

A rear collision means personal injuries in nearly every case.

The Ontario Safety League Has Published Some Excellent Posters for Trainmen

Work of a Safety Engineer

Tacoma Has Such an Officer, Whose Work Has Been Largely with the Trainmen and with the Public School Pupils

FOR a number of years past the Tacoma Railway & Power Company and the Puget Sound Electric Railway have taken an active interest in safety work. Some of the work done may be briefly summarized as follows:

Co-operation with safety commissioners in drafting revisions of existing ordinances.

Co-operation with the traffic division of the Police Department in detecting and punishing automobile drivers for violation of traffic ordinances, especially with reference to passing cars while the latter are receiving or discharging passengers.

Co-operation in general matters with the local safety council.

Co-operation with the State Board of Public Works in its efforts to lessen the number of grade crossing accidents.

Preparation from time to time of safety posters, bulletins and other safety literature and their distribution, especially in public garages and automobile clubs, and at the rooms of different civic organizations.

Transmission of letters of caution to careless automobile drivers, based on reports from the trainmen who have been instructed to be on the lookout for carelessness of this kind.

In addition the companies have now a special safety department, in charge of C. Paul Bates, safety engineer. The efforts of Mr. Bates so far have been devoted principally to the work among the men and in the public schools. One part of his duty which he considers very important is a special training in safety, courtesy and service, given to the trainmen after they have been accepted by the transportation department. To each new employee Mr. Bates talks individually, explaining the importance of the railway business as related to the industrial and commercial enterprises in Tacoma, the dignity of the work and its advantages, the necessity for operating rules and the importance of their application, and the need for a trainman to place himself in relation to his work as would be done by a salesman in a department store.

Another of his assignments is to work with and through the general safety committee in carrying out safety reforms throughout the system. This committee is composed of twelve representatives, namely, eight trainmen from the city line, one trainman representing the interurban line and one representative each from the track, power and mechanical departments. The personnel of this committee changes quarterly. Meetings are held monthly at one of the local hotels, where safety recommendations affecting car operation or employees are talked over at a luncheon provided by the company. After these recommendations are approved and formulated, they are submitted to the general superintendent.

The safety department also provides posters for the twelve bulletin boards maintained on different parts of the system for the use of safety poster material exclusively. Two of these boards are for the track department, one for the linemen, three for the mechanical department and six for the transportation department. Bulletins are changed weekly. Some of those used are selected from the service of the National Safety Council and others are prepared by the company's own safety department. Much time is also spent by Mr. Bates in riding over the lines and visiting the properties of the company to keep in touch with what is going on. The safety department also keeps an accident record of each trainman through notations on the employment card furnished by the transportation department. Charts are kept showing the daily average number of accidents per month, the number of accidents classified by nature of accident, etc.

The work done in the public schools is carried out in the same thorough manner. In each of the twenty-six grammar schools in which the company works it arranges with the principal of the school to appoint a safety scout master and then, through this leader, to have a boy and a girl in each room from the fourth to the eighth grade endeavor to induce all of the pupils to learn the safety rules, as given in the Safety Scout Guide. Each pupil who qualifies by learning these rules becomes a safety scout and receives a bronze safety scout pin. One boy and one girl from each grade are selected for especially meritorious work, the selection being made by the principals, the teachers and the safety scout master. Each receives a commission signed by the superintendent of public schools and by the president and the secretary of the local safety council. These commissioned scouts are further rewarded by being invited as the guests of the railway company at the annual safety scout picnic. The commissioned scouts are also eligible to compete for prizes offered by merchants and by the railway company in preparing safety reports, as prescribed in the Safety Scout Guide. A large American flag is also presented to the school having the largest number of safety scouts in proportion to the number of pupils enrolled.

Some of the schools include the safety rules as a portion of their regular English lesson.

San Diego's Accident Bonus

Three per Cent of the Gross Is Set Aside for Accidents and Accident Prevention, Including in the Latter a Bonus to the Men—The Plan Is Popular and Effective

By W. H. Moore
Claims Agent San Diego Electric Railway

ALONG "safety first" lines I suppose we have tried about everything that is usually tried by all electric railway companies, including campaigns in the schools, stereopticon slides for the benefit of the platform men, and all kinds of literature that seemed good and came to our attention from time to time. Of these no further mention is necessary, as all roads, no doubt, have tried all these different ways. But in 1914 our general manager, quoting from his bulletin, "sought to find some way in which motormen and conductors could take a more personal and vital interest in the safe operation of street cars and protection of the public; . . . seeking some solution of the accident troubles in relation to street cars."

Each year since that date, with few changes, 3 per cent of the gross receipts from cash fares, ticket revenue, and special car revenue was set aside as an accident fund. Out of that 3 per cent all claims for personal injuries and property damage (including outside law, court, medical, hospital, surgical supplies, coroners' and undertakers' expenses, including fees for witnesses at coroners' inquests, etc.) are paid and the rest is divided at the end of the calendar year among the platform men on a man-hour basis. All men, whether they have had accidents or not during the past year, participate, but when the "safety checks" are passed out, the attention of those who have been careless is called to the accidents they have had and they are cautioned to be more careful during the new year.

OPERATING COSTS CLASSIFIED AS SEPARATE EXPENSE

The cost of operating the claim department and services of our attorneys and the law department (salaries and expenses of the law and claim departments) are not deducted from the 3 per cent fund, but are considered as separate expenses.

The probable cost of cases pending before the Supreme or Appellate Courts is held out of the amount to be distributed to the car men; that is, the amount of the verdict is prorated over the number of years estimated to elapse before the decision of the court of appeal is anticipated and so much is taken out of the fund each year. If the case on appeal is reversed, the amount held back is given to the men at the next distribution.

Any man not on our payrolls on the day of distribution does not participate. By this we mean that if he has worked eleven months of that year and has resigned before the day of distribution, he loses whatever had accrued to his account had he stayed on the job. Many of the men have, from year to year, received checks of about $100, quite a neat little sum when you take into consideration that no extra work was required on the part of the men to receive this increased earning.

The good safety record of the company is greatly helped by the carmen's safety committee, made up of five carmen appointed thus to act. Their duties are to meet once a week and review the accidents during that current week. In that manner they are conversant with any dereliction of duty by any of their fellow employees and they have full authority to take the matter up with the platform man in question and caution him about any future carelessness. The members of the carmen's committee are paid for the services they perform in meeting weekly, at the rate of $3 each per night, which is deducted from the carmen's fund.

This system has continued from its inception in 1914 to the present date, with several small changes from time to time.

The position of the men in regard to this plan has been set forth by a member of the carmen's committee (Motorman F. Hollingsworth), who says:

> The advantages of the bonus plan as a prevention of accidents are many and far-reaching.
>
> In the first place, there are many persons who do not regard a hazard of accident seriously, while with others it leaves a lasting impression. This being the case, we are unable to interest all platform men alike in the prevention of accidents from a moral point of view.
>
> We find, however, that there are few persons who will not become interested in a movement where there is a chance of ultimate reward, especially if it be of a pecuniary nature.
>
> If a motorman or conductor sees a chance to add $5 or $10 to his monthly pay check, he at once becomes interested, and, knowing that his chance lies in the prevention of accidents, he will strive to that end regardless of what his attitude might be from a moral standpoint.
>
> A motorman starting out with a determination to prevent accidents soon discovers that if he is to be successful he cannot take chances, he must have his car under control at blind corners, he must sound his gong freely, he must not run in a reckless manner. In other words, he finds it to his advantage to obey all rules and regulations pertaining to safety.
>
> The conductor is in a similar position. He must be careful not to start his car before his passengers get aboard or alight, he must watch his steps closely and be ever mindful of the safety of his passengers.
>
> With both motorman and conductor striving to prevent accidents it becomes apparent to them that safe operation and violation of rules will not work in harmony. With this idea instilled in the minds of platform men, we are not only preventing many accidents but also find that we have raised the standard of platform efficiency through the hope of reward, vastly more than could have been done by any fear of punishment.
>
> Benefits derived by the bonus plan for the prevention of accidents are not confined wholly to platform men, but to the public as well. For instance, when it becomes generally known that platform men on the street cars are working for a bonus, in preventing accidents, it has the psychological effect upon the public of making them more careful, and creates an impression that the carmen are doing their best to transport them safely and that a certain amount of responsibility for their safety lies within themselves. It also has the effect in many accidents of the injured person taking the blame upon themselves, rather than to think the car crew is to blame for every accident that happens.

Municipal Employees to Watch Out for Safety

ON JULY 8 Mayor John F. Hylan of New York addressed a letter to the heads of all city departments asking each city employee to watch out for safety. The letter reads, in part:

> It is the duty of every such employee to bring to the notice of the proper officials any conditions that may come to his or her attention that tend toward danger or injury to the public, even though it be in places or departments in which the city employee as such has no official concern. This is a duty every city employee owes to the city as a loyal citizen.

The Mayor said that while the recent subway disaster in New York was one in which no department of the city government had any responsibility, its happening called into action several city departments to arrest and alleviate conditions arising out of the disaster and that each of these departments functioned with the utmost promptness and efficiency.

Safety Campaign in Oakland

THE San Francisco-Oakland Terminal Railways are taking an active part in the current campaign to instill caution into automobilists, and for this purpose the company has prepared a poster for display on all of its cars, picturing an automobile accident. The design, as will be seen, is somewhat similar to that being used by the steam railroads, but the background is a street and the colliding agent is an electric train instead of a steam locomotive. The electric train shown is like that used on the rapid transit service of the San Francisco-Oakland Terminal Railways, operating between Berkeley, Oakland, and other Eastbay towns and the ferry to San Francisco.

S.F.-O.T. Ry.

POSTER OF KEY ROUTE TO EDUCATE AUTOMOBILISTS

A Traction Edition of the Safety Pin

AN INDUSTRIAL edition of the *Safety Pin* has been published at Erie, Pa., for about three years. Recently a traction edition has been issued. Briefly, it is a small twenty-two-page pamphlet in the form of a diary, for distribution among the trainmen. There is a maxim on safety or good service for each day of the month, with other sententious paragraphs and enough humor to make it interesting.

Uniforms Given for Good Safety Record

THE trainmen of the railway of the Wisconsin Public Service Company, Green Bay, Wis., are not labeled "safe" or "unsafe" and probably if they were they would object seriously to the labels; but C. E. Warwick, superintendent of the railway department, has evolved a plan that accomplishes practically this very thing and the men are working hard to keep the signs polished and bright. A safety campaign was started on April 1 and publicly impressed upon the employees and the traveling public on May 14 when every trainman blossomed out in a new uniform with a carnation in honor of Mothers' Day. The offer made by the company was that a rebate on the uniform of $4 would be paid to each trainman who passed a period of three months in the employ of the company without a serious avoidable accident. In this way it was possible for a man with a good record to pay for a new uniform in a year.

For those who completed a period of three months with but one slight accident that might have been avoided by extra precaution, the company agreed to give a $3 refund on his uniform, and a $2 refund with but two not serious accidents charged to them. Every serious accident avoided by foresight or by extraordinary skill of the operator will offset one slight avoidable accident.

The men took up the plan with spirit and out of about twenty slight accidents that occurred between April 1 and July 1, but one was considered to have been avoidable by greater care on the part of the operator. Two men closed the quarter with "A plus" records. This means that in addition to not having any avoidable accidents during the quarter each avoided a near accident by foresight and extraordinary skill.

How One Company Cautions Automobilists

THE carhouse of the Paducah Railway is on the main artery of travel in that city, and the company has utilized this fact to do some effective "Safety First" advertising, particularly to automobilists. Adjoining the carhouse is an open plot, and here the company has erected in a conspicuous position a series of effective signs. Adjoining one, a Ford car which had been damaged in an accident was placed, with a sign of its own which declared that there were more than thirty automobile accidents in Paducah during April and twelve persons were injured.

The number of accidents in which street cars in Paducah have been involved has been reduced materially during the past two or three years, and this fact is attributed by the company to the result of its safety-first campaign, of which the signs are a part. Thus, for the five months ended May 31, 1922, the company, which operates more than 19 miles of single-track equipment, has paid out only $7.50 for accidents. Practically all of the trackage is in the city of Paducah. The Paducah Railway is controlled by Stone & Webster.

Letters to the Editors

Good Wear from Journal and Axle Bearings

KENTUCKY TRACTION & TERMINAL COMPANY,
LEXINGTON, KY., JULY 15, 1922.

To the Editors:

I notice in your issue for May 13, page 794, in the report of the Central Electric Railway Engineering Council, a reference to Ulco brand Frary metal bearings.

In January and February, 1922, the Kentucky Traction & Terminal Company at Lexington, Ky., received from the Cincinnati Car Company ten new lightweight double-truck cars weighing 25,100 lb. completely equipped. Ulco brand Frary metal journal and motor axle bearings were specified to be furnished with the new equipment, and this company, I believe, was the first to specify this material in both journal and motor axle bearings on new equipment. To date we have operated 327,282 miles and have not had a single failure in any instance, either in broken or hot bearings. These cars are averaging about 7,200 miles per car per month with a lubrication cost of 4.3 cents per 1,000 car-miles, all of which, in my opinion, speaks well for Ulco brand Frary metal bearings.

W. G. STUCK,
Master Mechanic.

Another Chicago Offer

Nature of Proposition Made by Surface Lines to Its Employees on July 18 Not Made Public

Possibilities of a strike on surface and elevated lines in Chicago were strong at the end of the week. With the men holding out for a renewal of present contracts and the companies insisting that there would have to be a cut in wages, the situation was recognized as being serious. It was thought the break might come suddenly when the men had a chance to vote on another offer made by the Surface Lines on July 18.

The nature of this proposition was not made public, but it was thought to be about half way between the original suggestion of President Blair of a 60-cent wage and the present maximum of 80 cents an hour. President Budd of the elevated roads has not named any new wage for his trainmen, but he has stated that they might look for a reduction in the near future. It has been customary to pay motormen on the elevated 2 cents an hour more than the maximum rate on the surface lines.

Fortified with the endorsement of 99 per cent of those who voted on the strike proposition, union officials for the trainmen of the surface and elevated lines in Chicago insisted that nothing but a complete backdown of the companies would prevent a tieup of the roads. This was the situation on July 14 when the result of the elevated employees' vote was announced as being practically unanimous.

It was then stated that the two unions would get together and determine on a common basis for action. Conferences were also held with Presidents Blair and Budd, who said they could not consider a renewal of present contracts but were willing to hear from the men on compromise proposals. It was also rumored that rates of fare on the elevated roads would be lowered if a satisfactory adjustment could be made with the men as to wages.

The Chicago situation is said to be complicated by a political angle, the trainmen as well as the management of the Surface Lines having stated that they feared they had been singled out for punishment because they were not on friendly terms with the city administration. They also rejected the overtures of the state board of arbitration, saying they have their own provisions for arbitration if that method is finally accepted.

In commenting on the threatening situation in Chicago in its issue for July 18 the *Evening Post* said:

> The car men will do a stupid thing if they strike in order to show their antagonism to the city administration. Chicago will object to having its nose cut off in order to spite its political face, and that is what such a strike would amount to.
>
> The gentlemen of surface and elevated lines are doubtless efficient motormen and conductors, but when it comes to playing politics with the city hall they are likely to find themselves well outside the class of experts.
>
> For shrewd ingenuity in the advantageous use of opposition we have had no equal in local politics to our present Mayor. We are inclined to think he would welcome a car strike aimed at the Pageant of Progress. We are certain he would make capital out of it far exceeding in value to him any satisfaction the strikers might derive.
>
> Better forget the political aspect of the situation. The time to deal with that is when the campaign begins and the votes are being made. The place to deal with it is at the ballot box.
>
> If Messrs. Blair and Budd are in the reasonable humor which report attributes to them, the wise course is to make the best terms possible, and let us all get on with our work.

Local union officials at Chicago were waiting on July 20 on the decision of Mr. Mahon, International president, for strike orders. Mr. Mahon is in Worcester, Mass., and has failed to take any action. Mr. Blair in offering 65 cents an hour announced that the company had submitted the best terms it conceived possible under the 7-cent fare. He emphasized his willingness to meet Mr. Mahon or any other union officials in a conference looking toward mediation.

Bill Fixing Hours of Labor Killed

The bill of Representative Reilly which passed the Legislature at its recent session has been vetoed by Governor John M. Parker. The bill provided a maximum of nine hours work in twenty-four hours for conductors and motormen in the employ of the New Orleans Railway & Light Company, New Orleans, La., instead of eleven hours in twenty-four as now obtains.

The bill was energetically supported by the trainmen's union and other labor organizations, and just as energetically opposed by Receiver O'Keefe, of the New Orleans property. He predicted that it would disrupt the contemplated reorganization of the company and would lead to a higher rate of fare than that contemplated by the company under the new agreement with the city calling for the reorganization of the company.

The Governor was urged by the interests behind the labor organizations to ignore the fact that the legislative committee had pronounced the measure unconstitutional and to leave this matter to be determined by the courts. He turned a deaf ear to these appeals, however. In affixing his veto the Governor declared:

> In my judgment they (the carmen) should work as long and make as much overtime as in their wisdom they see fit. No man's productivity or hours of labor should be limited without his consent. We should encourage real work, with reasonable hours and good pay for extra work.

Operations Resumed

Service Restored on Steubenville Line in Jefferson County—Tie-Up in Other Three Counties Continues

At a conference held in Steubenville, Ohio, on July 10 between representatives of Division 285, Amalgamated Association of Street and Electric Railway Employees, members of which division walked out on May 1, and officials of the Steubenville, East Liverpool & Beaver Valley Traction Company, the controversy which existed between the union and company was settled and the next morning operations on the lines of the company in Jefferson County were resumed. However, an agreement has not been reached with the men who operate the lines of the company in Columbiana County, Ohio: Beaver County, Pa., and Hancock County, W. Va., and the tie-up in those three counties continues.

Failure to succeed in arbitrating was attributed to the fact that the traction company refused to deal with union representatives at the meetings, but at the final conference they did so. In the contract signed, it is stated that the company shall recognize Division 285 and deal with the local committee in settling any difficulties which may arise during the continuance of the contract, but that the company does not recognize the international union. It was reported, but not confirmed, that representatives of the international union were present at the conference and sanctioned the action of the union men in signing such a contract. Aside from a slight wage cut of about 5 to 8 per cent, this is the only feature of the new contract which differs from the old.

During the continuance of the agreement, the wages for motormen and conductors in cents per hour will be as follows:

First six months of service	45
Next twelve months of service	47½
Thereafter	50

Five cents per hour additional for one-man car, express or freight, including messenger, work cars and snow sweepers.

Line car men same rate as two-man passenger cars.

The wages for carhouse men, in cents per hour, will be as follows:

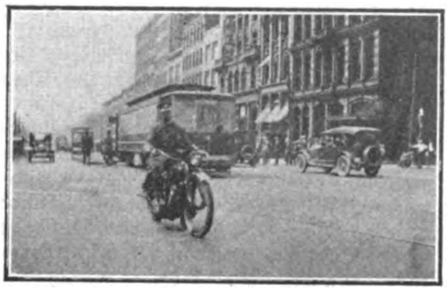
Day utility men	35
Night oiler	38
Night Inspector	38
Day repairmen	42

There appear to be no developments in the reaching of an agreement with the men operating cars in the counties outside Jefferson, but it is understood that the negotiations with these men are progressing, with the outlook fairly favorable. At the present time cars operate only as far as Port Homer, a small town on the northern border of Jefferson county.

All Day Service on Many Buffalo Lines

Mitten Management Is Carrying Out Successfully Its Plan for Opening Up All Lines With Men Recruited Under Its Co-operative Plan

MITTEN MANAGEMENT, Inc., operating the local and interurban lines of the International Railway, Buffalo, N. Y., has broken the backbone of the trainmen's strike in western New York and is operating cars on regular schedule throughout the day on most of the city lines of the International in Buffalo and on the Park & River division at Niagara Falls, Ont.



MOTOR CYCLE POLICE PROTECTING BUFFALO CARS

Although all cars are being operated under police guard, the company has discontinued the use of wire screened cars. Very few passengers are being carried but various men's and women's clubs are urging the public to patronize the cars to encourage the company in its fight against union domination by the Amalgamated Association. There has been some rioting, but up to July 19 no serious damage has been done by the strikers and their sympathizers.

Although the cars are being operated by experienced trainmen brought to Buffalo from other cities, Herbert G. Tulley, president of the International, says the company has received the assurance of a large number of men who went on strike that they are standing loyal to the company and are willing to return to work whenever they are called upon by the company. Until better protection is afforded by the police, it is said, these men will not be called upon to operate cars.

Cars are being operated on all West Side lines and some East Side routes of the International on 5 and 10-minute schedules and President Tulley said cars would be operated on all lines if the company could be assured of adequate protection. Some of the East Side lines will be the last to be operated by the company because they run through large foreign settlements and the company fears rioting and disorder as soon as cars are operated on these lines. Cars are being operated from 6 a.m. until 7 p.m.

Uniformed police ride on each car and in many instances motorcycle police trail each car. On some of the west side lines motorcycle police are detailed to patrol two or three blocks and do not follow the cars. At the outset the company used double-end cars on all lines, but now the International is using the type of cars adopted by the various lines.

President Tulley said that there can be no arbitration of the question of union recognition and that the only basis upon which men can return to work is the Mitten co-operative plan similar to the plan now in operation in Philadelphia.

As soon as the International feels that it is giving the public adequate service, President Tulley said he would appeal to the Mayor to have a ban placed on the operation of jitney lines within the city and in competition with the company's cars. If this does not prove successful, the company says it will apply to the courts for an injunction restraining the operation of jitney lines and also restraining the striking employees from interfering with the operation of cars or intimidating loyal employees and passengers.

CO-OPERATIVE PLAN EXPLAINED

This statement on the strike situation was made to the *Electric Railway Journal* by President Tulley:

> The only remaining question at issue is whether the electric transportation system in Buffalo shall be controlled by the foreign leaders of the Amalgamated Association, with headquarters in Detroit, or whether it shall be controlled at home and for the benefit of the people of Buffalo. In order that the company might be able hereafter to provide uninterrupted and satisfactory service, it is plain that this question as to whether control shall be lodged here or in Detroit must be fought out once and for all time. If we should sign an agreement as demanded, we should have only a recurrence of the disturbance upon the expiration of the new agreement in May and periodically thereafter, and Buffalo never could be assured of undisrupted and adequate service.
>
> The International and Mitten Management, Inc., are through with the old union and its closed shop and foreign dictation. The men who come back must come back under the Mitten Co-operative plan.

President Tulley of the International issued a statement setting forth the principles of the so-called Mitten co-operative plan. His remarks on this matter follow in part:

> The Mitten Co-operative plan for adjustment of the relations between employee and employer is based upon the fundamental principle that the successful running of a railway depends most upon the men who run it.
>
> The plan recognizes the right of employees to bargain collectively upon all matters affecting their wages, working conditions and discipline. It provides uncontrolled election of wage workers' representatives by each branch group of employees, elected by and among themselves by secret ballot. These, with an equal number of representatives appointed by the company, constitute branch committees, department committees and general committees.
>
> The branch committees serve as lower courts, where local points of difference are for the most part settled on the spot.
>
> All branch committeemen in each department come together as the department committee. Differences not settled in branch committees, on departmental questions, are carried to the respective department committees, as a higher court, where, by across-the-table discussions, local branch differences of opinion are adjusted to the broader viewpoint of the department as a unit.
>
> All department committees elect, from their own numbers, their representatives constituting the general committees as a superior court, where any limited departmental viewpoint merges into the larger vision of the best good for all.
>
> Final arbitration—the Supreme Court—if needed, is assured through an arbitration board in which the public, as the third great party in interest, is given the decisive voice.
>
> The co-operative association supported equally by employees and employer, assures the workers sick and death benefits and old age pensions, together with opportunity for the safe deposit and investment of their surplus earnings, made possible by their own thrift and the joint accomplishment of men and management.

The Rotary Club of Buffalo has adopted a resolution supporting the open-shop attitude of the International Railway and the Mitten Management, Inc.

EMERGENCY JITNEYS AWAITING BUSINESS

S. F. Northrup, director of the Bureau of Relations of the State Industrial Board and Henry D. Saylor, State Industrial Commissioner, were in Buffalo during the week ended July 15, but nothing was accomplished by either official. William Weatherwax, former superintendent of the Chicago traction lines under Mr. Mitten, who is acting as Mr. Mitten's Colonel House in Buffalo, continues to work in conjunction with President Tulley.

As the result of the injuries sustained by members of several train crews who were mobbed on July 19 by bands of strikers and their sympathizers, the International was forced to suspend service over several East Side lines until more adequate protection can be furnished.

Franchise Ordinance Hangs Fire

Refusal of the General Council to pass the new railway franchise ordinance as agreed on by the Mayor and officials of the Louisville (Ky.) Railway, and favored by the various leading civic and business clubs, attorneys for the city, etc., is resulting in the fare argument getting no place for the time being. The Mayor is showing plainly that he favors passage of the ordinance, and has gone before the Council Committee, with Clayton B. Blakey, City Attorney, to explain the settlement plan in detail. It is reported that the Board of Aldermen is in favor of the plan, and will vote for it when it comes up.

Among the tangles to be unraveled are the question of the 7-cent cash fare, service to be guaranteed by the company, one-man car issue and valuation of the properties of the company. Attorney Blakey claims that a valuation of a little more than $18,000,000 as proposed by the bill is the best that the city can expect, and held that he did not believe any court could overturn that proposal, as Federal courts have held that replacement cost of such companies should be used as the rate-making basis. The city in assessing the property value used a method provided by law, explained City Assessor E. E. Bristow, who explains that the capitalization on the net earnings or the market value of the stocks and bonds of a public utility must be used as the basis of an assessment.

The Mayor holds that delay in passing the ordinance is costing the citizens $2,000 a day, and that it may take years to reach a final decision in the courts if the case is further delay. The Mayor in part said:

> While, of course, I want to give the Council a reasonable time to consider the measure and do not want to be in a position of interfering with the legislative functions of the Council, I wish to call attention to the fact that the ordinance was well studied by the administration before it was submitted. If it is amended and the company does not agree to the amendments, it will be absolved from making the $900,000 of improvements called for. The case may then be thrown back into the courts, meaning a long delay and much expense for the settlement of the case.

There are indications that the lower board is holding out for a flat 6-cent fare, instead of 7-cent cash, and 6 cents on tickets, opposing a 7-cent fare in any form.

Suggests Reorganization Based on Actual Valuation

Scaling down the Cincinnati (Ohio) Traction Company's capitalization by reorganization based on its actual valuation, has been suggested to Mayor Carrel's Street Railway Committee, by William C. Culkins, executive secretary of the Chamber of Commerce and former street railroad director of Cincinnati. At the fourth meeting of the Mayor's committee, Mr. Culkins explained the history of the various railway ordinances leading up to his issuance of an order to the traction company for an effective financial reorganization and a discontinuance of the interlocking interests with the Ohio Traction Company. He said he did not commit himself as to the method to be used, because at the time he held a public office. As a private citizen, however, he said, that he could call attention to two methods. One was by reorganization based on actual valuation and the other was by a readjustment of outstanding securities.

Of the three valuations made in 1914 he said, he thought, that of the State Public Utilities Commission at $24,000,000 came nearest to being fair and equitable. That of the late Ward Baldwin, at approximately $12,000,000 he regarded as being too conservative and being merely a "junk" value, while the traction company's own estimate of $36,000,000 seemed excessive. A valuation made by his office as of Dec. 31, 1920, based on the methods used by the utilities commission, fixed the valuation at $23,000,000.

Members of the Mayor's committee were given to understand that the suggestion made by W. Kesley Schoepf, president of the traction company, that the meetings be executive, "when the affairs of the company are gone into deeply" was not prompted by a desire to conceal anything from the public, but to prevent publishing "disconnected or partial statements to misrepresent the affairs of the traction company."

Minnesota Road Now Doing Well

Rehabilitation of the former Dan Patch gaso-electric line operating from Minneapolis to Northfield by the present owners, who took over the bankrupt plant in May, 1918, has proceeded to an extent that its business is about to pay a return on the investment. The road was sold in 1918 under the receiver's hammer at $200,000. In the coming report of the Interstate Commerce Commission the valuation of the line, as a basis for determining freight rates will be about $4,000,000.

The capitalists who took over the line discovered that the Minneapolis, Northfield & Southern, as the road is now known, is an effective belt line reaching the great transcontinental and Chicago, Winnipeg and Duluth railroads. Its freight business in automobiles is greater than that of all other Minneapolis roads, due in part to the fact that the president is the head of a great motor car distributing agency. More than $400,000 has been spent in rehabilitation. The freight business has grown from almost nothing to 2,000,000 tons a month and its passenger business to ten trains a day.

One move of the new owners was to reduce the passenger rate on the electric lines from the legal 3.6 to 2½ cents per mile. This increased the train demand very materially. March passenger business was 50 per cent more than in 1921. The March report of tonnage was 2,000,000 tons as compared with 1,200,000 in 1921, and a negligible amount in 1918.

Outing for New England Men

The New England Street Railway Club will hold its annual outing at Newport Beach on July 27. Machines will leave Boston at 7.30 a.m. from the Engineers' Club, corner of Commonwealth Avenue and Arlington Streets, and will arrive at Newport Beach at 10.30 a.m. The day's festivity will consist of sports on the beach, bathing, shore dinner, dancing and an automobile tour through the famous summer colony. Trains leave Boston for Newport 8.20 a.m. (daylight saving). Automobiles will be at Newport station to carry those going by train. Trains leave Newport for Boston 4.50 and 9 p.m. (daylight saving). Tickets covering day's program will be $2.50.

Compliance With Commission Order Brings Satisfactory Results

Very satisfactory results have been reported by the Bureau of Accidents to the Pennsylvania Public Service Commission due to the compliance on the part of the electric railway companies to the General Order No. 5 of the commission. This order requires the conductor to precede the car over the tracks of railroad grade crossings and signal the motorman as to the safety of the movement. During a period of eight years and nine months there were only five street car passengers killed in collision accidents of railroad trains and street cars, although the latter cross the tracks of railroads at 611 points, 310 of which are on main lines.

Service Restored on Abandoned Line

The Chamber of Commerce of Bridgeton, N. J., is considering a plan to aid Clayton W. McPherson in operating the line of the Bridgeton & Millville Traction Company, which was abandoned by the corporation on June 15. Officials of the company announced at that time that the line had not paid in two years.

Mr. McPherson, after a conference with officials of the American Railways, purchased the 10-mile line of the Bridgeton & Millville Traction Company and has begun operations. The present cars are now being used but modern one-man cars will later be placed in service. The lease secured by Mr. McPherson is a short one and has been sanctioned by the Board of Public Utility Commissioners.

Merger Talk Revived

Senator King, of Utah, is preparing to introduce in the Senate a bill requiring the merger of the Washington Railway & Electric Company with the Capital Traction Company, operating railway service in the District of Columbia. Talk about a merger of this kind has been revived at every session for the last ten years, at least.

Railway Seeks New Franchise

Following the recommendation of the citizens' transportation committee's report made to the City Council last March, the San Diego Electric Railway on May 29 made a formal petition to the City Council, asking that body to submit to the voters a charter amendment to enable the company to apply for and receive a new franchise to replace its present franchise.

The purpose of the move, it is announced by Claus Spreckels, the general manager of the company, is to relieve the company of paving obligations and also to secure an indeterminate grant. According to the company manager, the election is asked merely to empower the Council to grant the new franchise, and the details of the franchise itself are to be negotiated between the City Council and company officials after the election. At present the charter makes a 2 per cent tax on gross receipts and certain paving obligations mandatory.

Compromise Agreement Reached in Grand Haven

A compromise agreement was reached some few weeks ago between the employees and the management of the Grand Rapids, Grand Haven & Muskegon Railway, Grand Haven, Mich., which established wage rates for another year of 42½ cents an hour for the first three months service men, 47½ cents for the next nine months service men and 52½ cents for those in service more than one year.

At the expiration of the previous year's agreement the company had made an announcement of a 5 cents an hour reduction, at the same time changing certain working conditions. The men protested but agreed to accept the reduction if certain provisions were made for the maintenance and repairmen and extra men. A meeting resulted in the compromise which was made upon the basis of 2½ cents per hour from the former rates.

Twin City Company's Right to Abolish Neutral Zone Sustained

Decision was filed by the Minnesota State Supreme Court on May 19 upholding by vote of three to two the decision of Judge F. M. Catlin of the Ramsey County District Court abolishing the so-called neutral fare zone on the Minneapolis-St. Paul and other interurban lines of the Twin City Rapid Transit Company. The decision was based on the terms of the Brooks-Coleman act, passed by the last Minnesota Legislature conferring on the State Railroad & Warehouse Commission right to determine reasonable rates.

The zone was established by the St. Paul City Railway in 1905, carrying the one-fare limit from Minneapolis to Snelling Avenue in St. Paul and from St. Paul to Bedford Street in Minneapolis, and it was abolished by the company on Jan. 7, 1922.

The decision is to effect that the St. Paul City Railway may collect fare at the city limits and that the right was not taken away by the Brooks-Coleman law of 1921.

It has been estimated the decision means an annual increase of about $300,000 in fares in the so-called midway or neutral zone, due to the fact that those who board the cars in this zono bound for Minneapolis will pay two fares and a second fare riding from Minneapolis into this zone.

The case arose through appeal by the petitioners, John H. Anderson and others, who were refused an injunction in the lower court forbidding the railway from wiping out the zone, which includes a district largely industrial employing people in both cities. The judges all agreed that the one-fare zone had been maintained voluntarily by the company up to the time the state railway act was passed. It could have been abolished any time up to then. The majority of the court held that the 1921 law did not change the right of the company to wipe out the zone. The dissenting judges, including the chief justice, held that the fare arrangement was authorized under the meaning of the law and that it should have been kept in effect until the Railroad & Warehouse Commission authorized the change.

Doherty Reported to Be After Kansas City Properties

Henry L. Doherty has an eye on the Kansas City street car system, says the Kansas City *Star*. According to that paper:

> Doherty engineers are giving the railways property a close scrutiny. Singly and in groups his representatives have been here and negotiations are understood to have been in progress with Armour and other interests. One of Doherty's best engineers is supervising this examination of the street car system.
>
> Coupled with Doherty's interest in the railways is an understanding in financial circles that an effort soon is to be made to extract the railway from the receivership and effect a reorganization.

At the office of Henry L. Doherty & Company in New York no secret was made of the fact that Doherty engineers were in Kansas City examining the property there, but it was said there was nothing for publication at this time.

Accident Circular Distributed

A sixteen-page accident prevention circular for distribution in the public schools of Cincinnati was prepared last summer in co-operation with the local Safety Council of the Cincinnati Chamber of Commerce by John A. Murkin. It is well illustrated, many of the views being of electric railway subjects and designed to encourage safety ideas in children while on the streets. They relate not only to the safety of the child himself but the safety of others, as when a thrown ball or stone breaks the windows of a street car. The older folks also are not forgotten in the injunctions.

News Notes

Service Resumed.—Service was resumed recently by the Washington (Ind.) Street Railway after an interruption of two days, during which time not a car was operated. Lightning burned out the armature coils and generator set supplying current.

New Company Becomes Reality.—On July 1, Spokane's trolley car riders exercised transfer privileges over all car lines in the city, the "Spokane United Railways," the new merger company, taking over the lines at midnight. All old franchises were surrendered by the two companies when the new one was issued by the city. Under the agreement with the city, jitney bus competition will be eliminated after Jan. 1 next, when the physical merger of the lines must be complete.

May Try Trackless Trolley.—It was recently intimated to the Rotary Club by Street Railway Commissioner Cann of Toledo, Ohio, that the Community Traction Company was considering trying out the trackless trolley on the south Erie Street tripper line because the present line was losing money every day. He also referred to the stabilizing fund of the company which he said would be close to $500,000 today but for bus competition. In his opinion a saving of $400,000 could be effected yearly by the installation of one-man cars over the entire system.

General Tax Fund Protected.—Completing the victorious litigation of the "fourteen taxpayers" to protect the general tax fund of the city from invasion for the Seattle (Wash.) Municipal Railway, Superior Judge J. T. Ronald recently signed a judgment enjoining the city from using in any way, including borrowing, any moneys from the general fund of the city in the maintenance and operation of the street railway, or in the payment of depreciation charges and making replacements. The judgment was based on the *remittitur* of the State Supreme Court, and was issued on motion of Attorney O. B. Thorgrimson of counsel for the "fourteen taxpayers."

Meetings on Safety Will Be Called.—Employees of the Monongahela Power & Railway Company are to be called into monthly meetings at which safety matters will be discussed. The first of the sessions will be held in Fairmont in the near future. Like gatherings will be called in Clarksburg and Parkersburg. One feature of a coming meeting will be the presence of a surgeon who will give employees practical demonstrations as to how to apply first aid treatment in case of accidents. The local company at Fairmont is placing great stress upon the safety features in an effort to instill the safety idea in the minds of the employees.

Financial and Corporate

Reorganization Operative

Preparations Being Made for the Sale of New Orleans Road to Bondholders Under Foreclosure

The plan outlined and described in the ordinance adopted by the Commission Council of New Orleans some months ago looking to the reorganization of the New Orleans Railway & Light Company is now in effect. The holders of 98 per cent of the 4½ per cent bonds of the company deposited their securities with the bondholders protective committee, of which R. S. Hecht is chairman. A resolution declaring the plan operative was adopted by the committee on July 15.

It is now proposed that, pursuant to the reorganization plan, the property of the New Orleans Railway & Light Company shall be put at auction, sometime in August, when it will be bid in by the protective committee, representing the bondholders. The date of the sale to be fixed shortly by Special Master Chaffe will be advertised for thirty days before the sale. Following the purchase of the property, another month may elapse in proceedings to be instituted to wind up the receivership, after which the new company will be launched. The new car fare and gas rates will probably not become effective before October.

J. D. O'Keefe, receiver of the New Orleans Railway & Light Company, has issued a statement showing the earnings of the company for the first three months of 1922, for all departments, were $1,058,340 out of a gross revenue of $3,876,447, making a rate of return of 9.5 per cent on the compromise valuation of $44,700,000. The earnings of the company, for all departments, for the year ending March 31, 1922, were $3,379,610, out of a gross revenue of $14,844,295, making a rate of return of 7.6 per cent on the compromise valuation. This return is on the basis of 8-cent fare. Under the new agreement, when effective, provision is made for a 7-cent fare, the reorganized company to be allowed a rate of return of 7.5 per cent.

While this would seem to indicate a rate of return of only 6.2 per cent beginning next October, when the new agreement becomes effective, those in position to know say that they feel fairly certain that the 7-cent fare can be successfully maintained, through the trial period, on account of the company being able to operate its several departments more economically through the installation of additional equipment, at the power station, and the use of large modern cars. This will make for greater convenience and comfort as well as for faster schedules, which is confidently expected will increase the carrying capacity of the company.

The detailed report, sent to Commissioner Paul Maloney of the department of Public Utilities, and given out by him for publication, is as follows:

	Railway	Electric	Gas	Total
THREE MONTHS ENDED MARCH 31, 1922				
Operating revenue	$2,086,211	$900,250	$889,985	$3,876,447
Operating expenses	1,287,479	474,478	430,167	2,192,125
Net operating revenue	$798,732	$425,771	$459,818	$1,684,322
Taxes	182,993	74,418	68,570	325,982
Net operating income	$615,738	$351,353	$391,247	$1,358,340
Renewals and replacement reserve	185,000	65,000	50,000	300,000
Gross corporate income	$430,738	$286,353	$341,247	$1,058,340
TWELVE MONTHS ENDED MARCH 31, 1922				
Operating revenue	$8,705,029	$3,401,770	$2,737,496	$14,844,295
Operating expenses	5,484,501	1,921,472	1,569,822	8,975,795
Net operating revenue	$3,220,527	$1,480,298	$1,167,674	$5,868,500
Taxes	735,592	290,295	263,001	1,288,889
Net operating income	$2,484,935	$1,190,002	$904,672	$4,579,510
Renewals and replacement reserve	740,000	260,000	200,000	1,200,000
Gross corporate income	$1,744,935	$930,002	$704,672	$3,379,610

Large Tax Payment Made

The sum of $781,411, representing the first payment of taxes that the Connecticut Company, New Haven, Conn., has made to the State in five years was recently handed to the State Treasurer at Hartford by President Lucius S. Storrs. This leaves a balance of $1,469,258 in unpaid taxes due the State from the company, which has been unable to meet its obligations to the State since 1917. Through legislation passed at the last session of the General Assembly, when it was apparent that the financial condition of the company had immensely improved, it was decided that the Connecticut Company should be called upon to pay one-half of its annual net earnings to the State in taxes until it had completed payment of all obligations, and at the same time an annual tax of 3 per cent of the gross earnings of the company for current taxes was levied. The company formerly paid at the rate of 4½ per cent, but the Legislature reduced the figures to 3 per cent.

Overtures for Purchase Must Come from City

Charles N. Black, president of the Market Street Railway, San Francisco, Cal., has notified Supervisor Warren Shannon, chairman of the special negotiation committee for the city, that his company would not name a price at which it would be willing to dispose of its transportation system to the people of San Francisco. The city must make an offer, President Black said, since the movement to purchase the properties of the company was not inaugurated by the directors of the company but by the city.

Mr. Black is quoted in part as having said:

> We desire to assure you that the disposition of the company and of its stockholders expressed in our letter of Dec. 17, 1921, remains unchanged, and the officers of the Market Street Railway are prepared to meet with your committee at any time for a discussion.

President Black's letter is an answer to a communication dispatched by Supervisor Shannon on behalf of his committee on June 14, following a series of meetings at which the valuation of the company's properties was under discussion.

Supervisor Shannon requested the directors of the company to name the price at which they would be willing to sell to the city.

Engineers for the Market Street company have placed a $51,856,218 valuation on its system. The State Railroad Commission engineers named $41,424,961 as the physical value of the system, while M. M. O'Shaughnessy, city engineer reported to the supervisors that he believed the properties to be valued at $40,000,000.

Disregarding the physical valuation estimated, Supervisor Shannon favored an offer of $25,000,000, based upon the earning reports of the lines for the past year. Valuations of $17,000,000 and $18,000,000 were suggested by Supervisors James B. McSheehy and Eugene E. Schmitz.

Eastern Massachusetts on Dividend Basis

A dividend of 3 per cent has been declared by the public trustees of the Eastern Massachusetts Street Railway, Boston, Mass., on the sinking fund stock and first preferred stock, series A, of the company.

The dividend is payable on Aug. 1 to stockholders of record July 25, 1922.

A statement which was made by the company about the matter says:

> This dividend declaration follows numerous fare reductions and rehabilitation of the street railway by the public trustees, under the leadership of Homer Loring, who has just resigned as chairman of the board.

The public trustees have had charge of the management of the system since June 1, 1919, and discontinued 123 miles of track since that time. In 1920, the road was operating 681 miles, but has since reopened some of its discontinued track, so that it is now operating 734 miles.

Earnings Favorable on Boston Property

The Boston (Mass.) Elevated Railway on July 14 made its first payment to the Commonwealth of Massachusetts on the $4,000,000 loan assessment which was advanced by the various communities in which the company operated in 1919 to cover the company's deficit from operation. This initial payment amounted to $517,196. It will be distributed among the contributing communities.

Under the Public Control Act the company has accumulated a reserve fund which last June amounted to $1,517,196, and the law requires that what the company can set aside in excess of $1,000,000 shall be applied to a reduction of its debt to the communities. Earnings are so favorable on the road at present that it is believed that the company will be able to pay off on this indebtedness regularly until it has been wiped out. Until this debt has been paid the Elevated has no legal right to reduce fares. At the present time it is carrying children for a limited period for a 5-cent fare, just as it is maintaining short hauls over which it is charging only a 5-cent fare, but these are not general reductions.

The June receipts in excess of cost were $87,529, against $79,415 for June a year ago. The number of 5-cents passengers it carried last June was 5,978,699 as against 1,803,309 in June a year ago. The total revenue passengers for June 1922 were 28,659,926 against 27,569,116 during June, 1921.

The Boston *Herald* of July 16 said:

> The Boston Elevated Railway today has more than $3,000,000 cash on deposit, and for the first time in 11½ years does not owe a dollar to the banks. The road earned more than $1,000,000 in excess of dividends in the first half of this year and on Friday made an initial payment of $517,196 on account of the municipal loan assessment of 1919. This brief account of their stewardship is one in which the public trustees might well take pride.

Interurban Road Acquired by North American Company

The North American Company has taken over the Milwaukee Northern Railway, operating about 57 miles of interurban electric railway line from Milwaukee north to Sheboygan, Wis. The company has a large passenger and freight business and furnishes electric light and power in the intermediate territory. Its total assets approximate $4,000,000 and its annual gross earnings are about $600,000.

By this acquisition practically all of the electric railway lines radiating from Milwaukee except the Chicago & North Shore line running south to Chicago are under the control of the North American Company.

Substantial economies in operating costs will be effected by operation of the Milwaukee Northern Railway in conjunction with the present system of the Milwaukee Electric Railway & Light Company and the latter company's large public service building in Milwaukee will be used as the southern terminus of the Milwaukee Northern line.

It is probable that the Milwaukee Electric Railway & Light Company will establish a bus line from Sheboygan to Fond Du Lac, thus permitting direct connection between the Milwaukee Electric Railway & Light Company's system and the Fox River Valley, making possible direct travel from Milwaukee to Green Bay.

Financial News Notes

Purchase Announced.—Oshkosh Gas Light Company, Oshkosh, Wis., has been purchased by the Wisconsin Securities Company through its subsidiary the Wisconsin Public Service Company. The price was in excess of $2,000,000. The Wisconsin Securities Company has also purchased the Menominee & Marinette Light & Traction Company which supplies Marinette, Wis., and Menominee, Mich., with utility service.

Preferred Stock Offered.—Dominick & Dominick and W. A. Harriman & Company, both of New York, N. Y., are offering $1,200,000 of 7 per cent cumulative first preferred stock, par value $100, of the American Water Works & Electric Company. The stock is offered at 87 to yield about 8.05 per cent. The stock may be redeemed as a whole or in part, after three years from date of issuance at $110 per share and accrued dividends.

Surplus Reported. — The Fonda, Johnstown & Gloversville Railroad, Gloversville, N. Y., has a corporate surplus as of June 1, 1922, amounting to $432,927, according to a statement which President J. Ledlie Hees sent to the stockholders. Mr. Hees stated that for the year ended May 31, 1921, the company earned 1.52 times its interest requirements, after deducting depreciation reserves, and 5.74 times its 6 per cent preferred stock dividend.

Capital Structure Changed.—The Appalachian Power Company, Princeton, W. Va., has been authorized in an amendment to its charter to increase its capital stock from $12,000,000 to $7,500,000 of preferred and 60,000 shares of common stock. The change in the capital structure of the company is in accordance with the plan to pay off the accumulated dividends on the preferred stock referred to in the *Electric Railway Journal* for June 10, page 949.

New Issue Offered.—Blodget & Company, New York, N. Y., are offering $900,000 of first and refunding mortgage gold 5s of the Cumberland County Power & Light Company, Portland, Me. The bonds are offered at 89¾ and interest to net 5⅞ per cent. They are dated Aug. 1, 1912, and are due September, 1942. The purpose of the issue is to reimburse the company in part for the cost of a new steam turbine generating plant and other additions now under construction.

People Will Decide.—The application of Oscar J. Mutchler, receiver of the Slate Belt Electric Street Railway, Easton, Pa., to issue $60,000 of receivers' certificates was heard recently before Judge William McKeen at Easton. It developed during the hearing that the company had been notified to pave certain streets in Pen Argyl and Bangor. The court signed a decree permitting the receiver to issue $21,000 of receivers' certificates to cover the cost of the paving. A reorganization plan for the company was proposed and the court directed the people interested in the reorganization to submit the plan signed by Oct. 2, stating that otherwise the receiver would be directed to offer the property at public sale.

May Appeal Tax Issue.—Litigation in which Kings County, the City of Seattle and the Puget Sound Power & Light Company figure over taxes imposed on the municipal railway for 1919 may be carried to the Supreme Court of the United States on an appeal. A. W. Leonard of the company has advised that the company wishes to make the appeal, and asks the city to join with it. A tax of approximately $400,000 was imposed on the railway in 1919, the year the property was purchased by the city, three-fourths of this being levied against the city and the remainder against the company, which had possession of the lines for three months of that year. The tax was opposed in the state courts both by the company and the city, but the Supreme Court held it valid. It is now two years overdue, and the interest, accumulating at the rate of 15 per cent, now amounts to about $15,000. The Council finance committee has the matter under consideration.

Public Utility Rating Book Issued.—A new edition of Moody's Public Utility Rating Book has just come off the press. The new issue contains the latest financial statements and earnings reports of public service enterprises of every kind in this country and Canada as well as the prominent foreign concerns. Analyses of securities are presented and a definite investment rating is assigned to every bond and stock issue. For many years Moody's rating books were used mainly by banks, financial houses and investors, but recently the public utility volume has come into general use upon the part of officers and managers of electric light and power, traction, gas, water, telephone and telegraph companies. The Public Utility Rating Book is one of a series of four volumes, the other sections covering Industrial, Government and Municipal securities, and Railroads. The industrial book for 1922 was issued early this summer, while the government and railroad books will be out within the next few weeks. They are all issued by Moody's Investors' Service, New York.

Traffic and Transportation

More Service Ordered

Transit Commission Requires B. R. T. to Add Sixty Trains in Rush and Forty in Non-Rush Hours

The New York Transit Commission issued an order on July 14 directing a marked improvement in service on the subway and elevated lines of the Brooklyn Rapid Transit System. The order, which will become effective on Aug. 15, directs the operation of 100 additional trains daily. Sixty to be supplied during the rush hours and forty during the non-rush hours. A further addition of thirty-five trains a day will be required in the fall.

The commission also directed the company to purchase and equip at once fifty new steel cars to permit the removal of the last of the wooden cars from the Centre Street subway loop. An effort will be made to have this equipment ready for service during the coming winter. In the meantime the wooden cars will be replaced temporarily by 100 metal-sheathed cars having a base that is said to be as strong as a steel car. This will remove much of the hazard of wooden car operation in the loop at once and provides ultimately for all-steel equipment.

While the commission did not go quite as far in its order to the Brooklyn Rapid Transit Company as it did in its recent order to the Interborough Rapid Transit Company, particularly in regard to new cars, the commission explained that the financial situation of the Brooklyn Rapid Transit Company, which is in the hands of a receiver, was such that it seemed that fifty new cars, to cost about $750,000, was all that the commission could direct the company to order. The commission added that it was expected that an improved financial condition would permit further outlays for new cars by the company in the fall.

The commission stated that in providing the increased subway and elevated service and in the provision made for financing the purchase of the new cars it had had the co-operation of Judge Julius M. Mayer of the United States Circuit Court and Receiver Lindley M. Garrison. After receiving a copy of the order, Mr. Garrison announced that it would be accepted. The purchase of the fifty new steel cars will not require any new financing, as in the case of the Interborough, which was directed to purchase 350 new cars, 100 of them immediately. It has been agreed that the Brooklyn Rapid Transit will purchase the new cars out of funds on hand in the depreciation fund provided for by contract No. 4 of the dual subway contracts.

The additional car mileage effective on Aug. 15 will be approximately 9,000 during the non-rush hours, and 3,000 during the rush hours. In the non-rush hours, the order contemplates that the company shall provide a seat for every passenger. The percentage of increase in seats provided on the different lines and during the different hours runs from 5 to 70 per cent. The greatest proportionate increase is on the Broadway elevated line, where there will be an increase of 70 per cent in service between 3 and 4 o'clock in the afternoon.

The service order does not apply to schedules for Saturday afternoons, Sundays and holidays. The commission said it would issue an order later covering such periods, but because of the great fluctuations of traffic on these days had refrained from making a definite order at this time. The commission will exercise close supervision over this traffic, and the company has promised its co-operation in taking the best possible care of the Saturday afternoon, Sunday and holiday crowds.

Five-Cent Fare Must Wait

Nothing can be done by the officers of the city to bring about 5-cent carfare on the Seattle (Wash.) Municipal Railway lines until after the Circuit Court of Appeals hears the appeal of the city in the so-called "specific performance" suit brought by the Puget Sound Power & Light Company, Mayor J. Brown states. The Circuit Court is scheduled to sit in Seattle and hear this case early next fall. The suit was brought by the Stone & Webster interests, to compel the city specifically to perform the contract of purchase under which the city took over the local road at Seattle from Stone & Webster. It was heard by Federal Judge E. E. Cushman in the District Court, and the decision upheld the Stone & Webster interests. The city appealed the case to the higher tribunal.

Six-Cent Cash Fare Authorized in Duluth

Authority to increase its fares to 6 cents with a provision that tickets be issued in minimum lots of five at the present rate of 5 cents, effective on Aug. 1, 1922, was granted to the Duluth Street Railway in a decision handed down on July 14 by the Minnesota Railroad & Warehouse Commission. By its decision the commission rejects the application of the company for a 7-cent fare, or four rides for a quarter. The commission also establishes 7½ per cent as a fair rate of return on the company's investment. The city had recommended 6 per cent. The city will seek a temporary injunction against putting the new fare schedule into effect. The fare is 5 cents now.

Ten Cents in Levis

Interesting Commission Decision Covering Eleven Mile Road Beset by Strike and Fire

The Public Service Commission of Quebec has decided to grant the request of the Levis County Railway for authority to modify its schedules and zone limits. An order to this effect has been formally entered. Under it, the company is authorized to charge 10 cents per passenger per zone, but tickets are to be sold to school children at the rate of twenty-five for $1.25 at the company's offices to children not more than sixteen years old.

The commission also decided that cost of maintenance of that part of the highway between the company's tracks and outside of them to the ends of the ties shall hereafter be borne by the municipality in which the tracks are located. Moreover, the company is to be reimbursed for all expense incurred to it for any change of location or repairs necessitated by work carried on by the municipalities.

In St. Romauld snow removal is to be carried on by the tramway as at present, but in Levis, Bienville and Lauzon the municipalities are to pay up to $16,000 toward the expense of snow removal but are not to be subject to costs beyond this amount. These payments are to be made in the proportions of eleven-sixteenths by the city of Levis, four-sixteenths by the town of Lauzon and one-sixteenth by the village of Bienville.

Within the limits of their legal authority, the four municipalities are to prevent competition against the tramway by bus and other common carrier. A full report of operations for the first year of operation under the new order is to be filed with the commission during the first month after the completion of the full year's operation. Any questions arising in dispute over the interpretation of the provisions of the new order are to be submitted to the commission for settlement.

Operation of the property at Levis has been fraught with unusual difficulties in the past few years. Up to 1919 the track and rolling stock were in poor condition, but in that year the railway effected an almost complete reconstruction. In 1920 there was a strike, and no sooner had the road again been returned to a condition for satisfactory operation when on Feb. 21, 1921, the carhouse and its contents of cars and snow-fighting equipment were destroyed by fire. Since then service has been unsatisfactory because of the inability of the company to refinance itself under the existing conditions. Although the municipalities realized the need of the company for relief they were unable in conference with the company to arrive at an agreement and so the case came before the commission. This occurred on March 24, 1922, under the provision of an amendment to the acts of the province.

The company contended that the line

had always been operated at a loss and that as this fact was well known the company was not in a position to secure the new capital required to rebuild the system.

In view of the conditions which existed the commission was called upon to value what remained of the system and to determine what would be required to insure proper service, and at the same time guarantee to those who advance funds a legitimate return on the investment. The commission said quite frankly that there could be no question of guaranteeing the interest upon all the money sunk in the venture but only upon the part which remained as an asset. Dr. L. A. Herdt for the railway and William R. Russell for the city estimated the value of the system as to the serviceable capital upon which there should be a return. Mr. Herdt was of the opinion that the system should not be valued as if it were about to be sold, but rather at its renewal cost at the moment of valuation. Mr. Russell did not express any opinion as to the principle, but valued the system partly according to its renewal cost and partly according to its depreciated value. The commission valued the system by endeavoring to estimate the cost of labor and of intact materials as in the case of a new enterprise, the balance being valued at its actual or depreciated worth. The commission said:

> The commission is of the opinion that in fixing the rates, the theory that the visible assets should be estimated at their cost of renewal is fair, as otherwise the invested capital could never be fully remunerated, because of the fact that from the moment material is employed, and even before the construction work has been terminated and the system put into operation, it has already undergone a certain depreciation; further, the system under valuation should originally have been constructed of new material and kept in such a good state of maintenance that its cost of operation would be equivalent to that of a new system.

This was the theory propounded by the commission. It found, however, that some second-hand material was used in building the line and in reconstruction and that the company never carried any reserve fund. Such being the case the commission felt called upon to make an option between the two theories on the basis previously stated. It accordingly placed the total value of the visible assets at $575,096, of which $467,558 was credited to the value of the visible assets without the general outlay. The new capital requirement the commission placed at $219,068, making a total of $794,165. With reference to a legitimate return the commission ruled for 6 per cent on present capital and 7 per cent on future capital. It estimated the total fixed charges at $65,723, made up of $34,505 representing interest at 6 per cent on $575,096; $15,334 representing interest at 7 per cent on $219,068; and $15,883 representing depreciation at 2 per cent on $794,165.

Then came the nice question of fixing the fare. As previously indicated, it was concluded that by adults paying a 10-cent fare and school children 5 cents the average fare would be at least 9 cents. Two million passengers at 9 cents would produce a revenue of $180,000, an increase of $28,479 in the gross receipts over the probable revenue under the old rates. This estimate the commission pared to $20,000 because it felt that the suppression of the sale of tickets would tend to diminish the riding habit. In consequence there would be a deficit of $12,196. The opinion of the commission was that the only visible means of meeting the deficit was to oblige the municipalities to bear a portion of the expenditures for paving and snow removal.

The commission's estimate of earnings of the Levis County Railway follows:

Gross receipts	$171,521
Cost of operation	105,581
Surplus	$65,939
Fixed charges	65,723
Net Surplus	$215

The Parish of St. Romauld sought to abide by the contracts in existence, but the commission held that its ruling, in order to be binding, should apply alike to all the municipalities through which the company operates. Since the order was issued St. Romauld has entered an appeal on a point of law, maintaining that the commission has no jurisdiction. Later the city of Levis entered an appeal, although it was in fact this municipality that brought on the investigation by the commission. In consequence, the company after having started to reorganize the fire loss suspended all operations. Four days later the city of Levis withdrew its appeal and the company is now proceeding to take the steps necessary to replace the fire loss, although the appeal of St. Romauld is still pending. Should St. Romauld win, the company will probably discontinue service in the winter in that municipality, simply operating when it pays to do so.

Other Cities Will Try Dollar Pass

Following studies made by Walter Jackson, the railways in the cities of Tacoma, Everett and Bellingham, Wash., in which Stone & Webster operate, have decided to adopt the dollar pass. The new plan goes into effect in Tacoma on July 24 while Bellingham is expected to begin with the pass on Aug. 1. In Tacoma the pass will replace the 10-cent cash fare and a ticket rate of about 8 cents. Bellingham retains the 7-cent cash fare with fifteen tickets for one dollar, and Everett retains the 10-cent cash fare with four tickets for a quarter, but has promised a trial of the 5-cent fare when the new franchise and improvements become effective.

Backing up Mayor A. V. Fawcett in his fight to force the Tacoma Railway & Power Company to establish a 5-cent fare basis in the city, the City Council has issued a franchise for the operation of twelve sixteen-passenger buses over the South Tacoma-Point Defiance line, in competition with the railway lines. The buses will charge a 5-cent fare. The jitney franchises was granted by the city after the Tacoma Railway & Power Company, through its manager, Richard T. Sullivan, had refused the proposition of Mayor Fawcett that the company issue twenty tickets for $1 without transfer rights, and sixteen tickets for $1 with transfer rights. The company has definitely declined to consider further such a plan, ascertaining that such a reduction in fare would be ruinous to the company.

Transportation News Notes

One Fare Extension Benefit Patrons.--The Detroit (Mich.) Municipal Railway has extended its one fare zone service in several sections of the city. This has meant a considerable saving to car riders.

Lower Fares in Effect.—A reduction in fare amounting to about 25 per cent is in effect on the lines of the Rutland Railway, Light & Power Company, Rutland, Vt. An increase in riding has resulted on the North Belt line.

Additional Fare Allowed.—The Capital Traction Company, Washington, D. C., has been authorized to charge an additional fare of half a cent for each passenger over the new Georgetown bridge. This extra fare goes to the government for use of the bridge.

Seven-Cent Fare Extended.—The Public Service Commission recently authorized the United Railways, St. Louis, Mo., to continue to charge the 7-cent fare for a period of thirty days. The fare would have returned to 5 cents if this order had not been issued.

Lower Fares to Continue.—Fares on the city line of the Connecticut Company in Bridgeport and Norwalk, will remain 5 cents until after Sept. 1, Public Utilities Commissioner Charles Elwell has officially announced. This extension of time will give a ten months' test on which to base the fixing of permanent rates.

Wants to Operate Bus Line.—The Johnstown, (Pa.) Traction Company has protested to the Public Service Commission against the proposed extension of routes of motor bus companies operating in Cambria, Somerset and other adjoining counties. At the same time the company asks for a permit to operate a bus line of its own.

Seek Five-Cent Fare.—Employees of the Bethlehem Steel Company who ride between the Steelton plant and their homes will ask the Harrisburg (Pa.) Railways for a 5-cent fare. A petition to this effect has been placed in the hands of the safety and welfare committee by the employees' representatives. The petition states that wages are the same as in the time of the nickel fare and that the present fare should be cut 1 cent.

Personal Mention

St. Louis Names School for Railway Pioneer

As a continuous reminder of what Erastus Wells, pioneer street railway operator of St. Louis, Mo., contributed to the progress of the city stands the Erastus Wells Grammar School at Clarence, Newstead and Carter Avenues. This school, which in a few years is to be reconstructed as a grammar or junior high school, was recently named in honor of the veteran railway operator by the City Council.

Recognition of the great part which railway men have played in the building up of the country is not lacking. A conspicuous example of tribute paid to a railway executive is the monument that was erected in Minneapolis, Minn., to Thomas Lowry, founder of the Twin City Rapid Transit Company. St. Louis is but giving honor to whom honor is due in naming this group of buildings after Mr. Wells.

Pioneering with a fighter's spirit perhaps best describes Mr. Wells' entire railway work. In association with Calvin Case, Mr. Wells established the first onmibus line in St. Louis and west of the Mississippi River and ran it successfully for a number of years. To Mr. Wells also falls the credit of organizing and operating the first street railway, the Missouri Railroad Company of St. Louis, west of the Mississippi. He ventured on this project in 1859 and was president of the company until 1861, when he sold out his interest. He was also at various times president of the Steam Suburban Road, which operated between St. Louis and Florissant, Mo.; a director of the Ohio and Mississippi Railroad and president of the Laclede Gas Light Company. He was also an active leader in all city affairs and in United States Congress, where he served for eight years. Mr. Wells died in 1893.

The connection of the Wells family with the railways of St. Louis has never been entirely ended. For a time there was no direct participation by the family in the actual management of railway affairs there, but at the present another member of the family is performing an important work. He is none other than Rollo Wells, receiver of the United Railways—an illustrious son of the illustrious Erastus Wells.

Commission Engineer Studies Transit Abroad

Daniel L. Turner, the consulting engineer to the New York Transit Commission, has sailed for Europe to spend two months in the study of new methods of transit construction in France, Germany, and Austria. The commission has already made public its $218,000,000 plan of new construction, but hopes to have the aid of the various new methods that have been introduced abroad since the war. Mr. Turner will combine a search for the practical and the beautiful. While in Germany he will study the system employed there in building open-cut subway lines through suburban territory.

Honor Post for C. M. McRoberts

C. M. McRoberts, general claim agent of the Los Angeles (Cal.) Railway, who was elected president of the Pacific Claim Agents' Association at its convention in Los Angeles June 7-9, has been in claims work since 1906.

Mr. McRoberts was born in Indiana in 1874. He was educated at the college at Oakland City and the Indiana Law School at Indianapolis. From his graduation in 1898 until 1903 he practiced law at Princeton, Ind. In 1903 he was appointed to the Government Bureau of Indian Affairs, with headquarters at Muskogee, Okla.

C. M. McRoberts

He entered the employ of the Illinois Central Railroad in the claims department in 1906, being located at Greenville, Miss., and later at Freeport, Ill.

When he went to California in 1911 he was made assistant general claim agent of the Los Angeles Railway and was appointed general claim agent in 1919.

F. W. Brownell, who has been general accountant for the Puget Sound Power & Light Company, Seattle, Wash., now has the title of comptroller.

P. W. Thomson, formerly general manager of the New Brunswick Power Company, St. John, N. B., furnishing railway, light and power service, has returned to his private business in the William Thomson & Sons Company, insurance agents, St. John.

Manuel Trucco, director general, and other representatives of the Chilean State Railways are in this country and recently made a tour of inspection of the Westinghouse Electric & Manufacturing Company plant at East Pittsburgh, Pa., where the $7,000,000 order for electrification equipment which was received last October is now being fulfilled.

A. J. Anderson, auditor of the Salt Lake & Utah Railroad, Salt Lake City, Utah, has been made general freight and passenger agent. A. V. Kipp, who held this position, has been made traffic manager; George W. Shaver has been appointed electrical engineer, and C. M. Osborn acting auditor.

J. C. Kennedy, Dallas, Tex., has been appointed general manager of the Marshall (Texas) Traction Company, succeeding P. J. Hayes, who has been transferred to Hugo, Okla., as general manager of the utility company's plant in that city. Mr. Kennedy announced that the improvements begun under Mr. Hayes would be continued until completed.

Obituary

Martin S. Decker

Martin S. Decker, formerly chairman of the Public Service Commission of the Second District of New York and for twenty years associated with the work of the Interstate Commerce Commission, is dead. His long connection with the Interstate Commerce Commission began with the inception of the commission in 1886, when he was appointed docket clerk. At that time he was a Deputy Clerk of Ulster County, and had studied law while in that position. He drafted many Congressional bills affecting interstate commerce law, including several sections of the Hepburn bill of 1906. He was chairman of the Public Service Commission in 1913 and 1914. In 1909 and 1910 he was president of the National Association of Railway Commissioners.

Walter Hinmon, Detroit (Mich.) Railway Supply Company, was killed in an automobile accident near Detroit on June 23. Mr. Hinmon was formerly connected with the Peter Smith Heater Company and prior to that with the Cooper Heater Company.

Charles E. Arnold, railroad builder, died at his home in Mount Vernon, N. Y., on June 8. Mr. Arnold organized the Saratoga Electric Railroad, and also built railways at Albany, Lake Placid and Saranac Lake. He was interested in steam roads also and was connected with the Port Chester road, which became the New York, Westchester & Boston Railroad, and the West Shore Railroad. He established the Commercial Union Telegraph Company, and for some years recently was manager of the Western Union Telegraph Company in Mount Vernon.

Manufactures and the Markets

DISCUSSIONS OF MARKET AND TRADE CONDITIONS FOR THE MANUFACTURER, SALESMAN AND PURCHASING AGENT

ROLLING STOCK PURCHASES BUSINESS ANNOUNCEMENTS

Power Improvements Will Total $250,000

Improvements and additions costing $250,000 are being made during the present summer by the Indiana Service Corporation on the company's power plant in Fort Wayne.

A new switch house is to be built. This unit, which will cost $10,000, will be an auxiliary to the main plant and an addition to the present building housing the distribution system. The first unit of the new building was begun last November. It will be finished together with a second unit, by the middle of August. Work on the second unit was started recently. The company is doing the construction work itself. Its electrical and civil engineer departments drew the plans for the structure.

The improvement made by this new building will permit a better distribution of power. It will tend to eliminate interruptions to service, assuring a more uniform flow of current. Current, as the result of this new arrangement, will be furnished more uniformly and with less chance of temporary cessation for lighting, for street and interurban systems and for industrial plants.

Another change of importance is the addition to the company's equipment of a new turbine which, it is said, will be larger than either of the two now in use. This change has necessitated the installation of new machinery at the various sub-stations of the corporation and this work is now in progress.

Bids for Chicago Cars

The Chicago Surface Lines is receiving bids on forty-five double-truck four-motor one-man safety cars, sixty-five double-truck four-motor two-man cars and four additional four-motor double-truck cars equipped with motors with sufficient capacity to haul trailers all day and through tunnels. The last four will be purchased by the Chicago City Railway Company. The sixty-five four-motor cars will be purchased for the Chicago Railways to replace those lost in the Devon carhouse fire. These will be very similar in design to the standard Chicago car known as the Pullman type and will seat forty-nine passengers. Of the forty-five one-man safety cars, nineteen will be purchased for the Chicago City Railway and twenty-six for the Chicago Railways. These will be equipped with the double passageway and automatic exit door. They will be ten-window cars, seating fifty passengers with a weight not exceeding 30,000 lb. The sample double-truck safety car equipped with the automatic exit door and double passageway and described in *Electric Railway Journal* for Jan. 14, 1922, page 65, was a nine-window car, weighing 28,050 lb. and seating forty-five passengers. The possibility of a more satisfactory arrangement of equipment was the determining factor in adding one window to the car length. It is expected that the order will be placed in the near future. The report in the *Journal* last week stated that the company contemplated the purchase of fifty trailers, but it is now planned to purchase the above noted motor cars and no trailers.

Kansas City Plans Track Reconstruction

The Kansas City Railways has been authorized by its receivers to do a large amount of track rehabilitation. Trackage changes in the yards at Forty-eighth Street and Harrison and at Ninth and Brighton include the renewal of eight turnouts and additional tracks and entrance curves to provide for freer movement of cars and also additional storage space. The estimated cost of the track changes for the Forty-eighth and Harrison yard is $32,000, and the improvements in the yards at Ninth and Brighton are estimated at $78,000.

Tracks are to be reconstructed on Eighth Street from Broadway to Wyandotte. This requires 560 ft. of double track to be rebuilt. The track is to be 7-in. 91-lb. T rail laid on International steel ties, with 9-in. of ballast. All joints will be welded. The paving is to be of granite upon a 6-in. concrete foundation. Approximate cost of this work is $15,000. Tracks are also to be reconstructed on Thirty-first Street from Troost to Woodland and on Grand Avenue from Twelfth to Fifteenth Street. The same type of construction will be used. The work includes the reconstruction of 3,840 ft. of double track at an estimated cost of $101,000. In addition to this work a large number of minor renewals are also being made, and several layouts of special trackwork are being entirely renewed.

New Cars Being Constructed for Melbourne

The Melbourne & Metropolitan Tramways Board has decided that future rolling stock will be constructed partly in the board's own workshops and partly by contract. In order to provide for the new equipment necessary for the conversion of the cable tramways, additions will be made to the rolling stock equipment at the rate of between fifty and sixty cars annually for several years. Provision will be made at once in the new workshop for constructing and equipping thirty of these cars and tenders will be invited for the balance. It is probable that the board will invite tenders within the next few months for the construction of about sixty single-truck electric tram cars, delivery to be spread over approximately two years.

Wholesale Prices in June

A further increase in the general level of wholesale prices for June, as compared with the preceding month, is shown by information gathered by the United States Department of Labor through the Bureau of Labor Statistics in representative markets of the country. According to the bureau's revised index numbers, this increase measures 1⅓ per cent, which compares with an increase of 3½ per cent from April to May.

The largest price gains were reported for fuel and building materials, in each of which groups the June level was over 4 per cent higher than that of May. Food articles averaged nearly 1½ per cent higher and cloths and clothing over 2¼ per cent higher than in the month before. Metals showed an advance of ⅜ of one per cent, while no change in the price level was shown for chemicals and drugs and house furnishing goods. Farm products, on the contrary, due to declines in grains, hay and eggs, decreased ⅜ of one per cent in average price from May to June, while the group of miscellaneous commodities, due largely to the drop in cattle feed prices, decreased 1⅜ per cent.

No Bidders for Car Plant

No bidders made their appearance, when Sheriff J. E. Cusick of Montgomery County, Ohio, offered the plant of the Barney & Smith Car Company, Dayton, for sale at the courthouse on July 12. No deposits had been received from prospective bidders. Valentine Winters, receiver of the company, stated that a reappraisement would be sought by court order in an effort to dispose of the property. The present appraisement is $200,000. A sale of the property cannot be made for less than two-thirds of the appraised value, which the bondholders manifestly consider too high.

Metal, Coal and Material Prices

Metals—New York	July 18, 1922
Copper, electrolytic, cents per lb.	13.875
Copper wire base, cents per lb.	15.75
Lead, cents per lb.	5.42
Zinc, cents per lb.	5.72
Tin, Straits, cents per lb.	31.375
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$6.55
Somerset mine run, Boston, net tons	3.50
Pittsburgh, mine run, Pittsburgh, net tons	....
Franklin, Ill., screenings, Chicago, net tons	....
Central, Ill., screenings, Chicago, net tons	....
Kansas screenings, Kansas City, net tons	4.25
Materials	
Rubber-covered wire, N. Y., cents per lb.	5.90
Weatherproof wire base, N. Y., cents per lb.	15.50
Cement, Chicago net prices, without bags	$2.05
Linseed oil, (5-bbl. lots), N. Y., cents per gal.	91.50
White lead, (100-lb. keg), N. Y., cents per lb.	12.50
Turpentine (bbl. lots), N.Y., per gal.	$1.18

Proposed Subway for Lisbon

The United States Department of Commerce reports that the promoters of the proposed subway for Lisbon, Portugal, are developing their plans, and it is stated they have recently presented a formal petition to the Municipal Chamber of Lisbon for the necessary authority to construct and operate such an undertaking. The chamber has requested the petitioners to supply it with detailed information concerning the project in order that it may be properly considered.

Another Record Shipment of Railway Material Made

Another trainload of electric railway apparatus left the Pittsburgh plant of the Westinghouse Electric & Manufacturing Company last week for France. The shipment consisted of equipment for the French Midi Railways as part of an order which totaled over $1,000,000. The apparatus shipped weighed approximately 800 tons.

Commercial Conference Called

To assist in the development of international good will and of better commercial relations a Pan-Pacific Commercial Conference will be held in Honolulu in October under the auspices of the Pan-Pacific Union. This is the fourth in the series of conferences which this organization is calling. The first was a conference of scientists, the second of educators and the third of journalists.

Saving in Repairs to Cars Effected

Although there has been an increase in the number of cars in service on the Los Angeles (Cal.) Railway, making safety standards harder to maintain, the total cost of repairing cars as a result of accidents in the first five months of 1922 was only 3 per cent more than the cost for the same period in 1921. According to *Two Bells*, the official publication of the Los Angeles Railway, the total number of accidents of all classes from Jan. 1 to June 1 of this year was 6,257 against 6,084 in the same period a year ago. This shows another benefit of the safety-first practices.

Electrification Planned by French

A special cable to the New York *Times* of July 4 states that the French Cabinet decided to communicate to the Reparation Commission a plan for construction by Germany on account of reparations several big power stations in the Rhone valley for electrification of the railroads in the district. All contracts made between the French government and the German contractors will be submitted to the commission which will negotiate with the German government to secure payment to the contracting firms. A similar plan was proposed by the late Dr. Rathenau several months ago and at that time was rejected by the French government.

Rolling Stock

Valdosta Street Railway, Valdosta, Ga., has ordered fare registers for all its cars from the Ohmer Fare Register Company, Dayton, Ohio.

Cheyenne (Wyo.) Electric Railway has purchased two new cars of the Birney Safety type which will be put in operation during latter part of August.

Ottawa (Can.) Electric Railway has been authorized to spend $30,000 for the delivery within two months of twenty of the latest type Westinghouse motors equipped with helical gears.

Savannah (Ga.) Electric & Power Company started the operation of new safety cars on the Habersham Street line on July 5. The thirty safety cars purchased cost more than $200,000.

Muskogee Electric Traction Company, Muskogee, Okla., will purchase six new cars for use in the downtown district. As soon as the new cars arrive the company will begin rebuilding some of its old cars to provide more efficient service.

New York Consolidated Railroad Corporation, which operates the subway and elevated lines of the Brooklyn Rapid Transit System, has been directed by the New York Transit Commission to order and equip at once fifty new steel cars so as to retire the wooden cars which are now in service in the Centre Street loop, New York. Efforts are to be made to have this equipment ready for service during the coming winter.

Track and Roadway

El Paso (Tex.) Electric Railway is well under way with the work of laying double tracks at Five Points. The program of improvement represents an expenditure of $60,000.

Valdosta (Ga.) Street Railway will extend its tracks several blocks if the commission approves its application for bond issue.

Indiana Service Corporation, Fort Wayne, Ind., has been granted a franchise to double track Columbia Avenue from Anthony Boulevard to Crescent Avenue.

Capital Traction Company, Washington, D. C., has been authorized to extend its tracks over the new Georgetown bridge. The underground current system will be used at a cost of $150,000.

Olean, Bradford & Salamanca Railway, Olean, N. Y., expects to strengthen, for heavier loading, various bridges over the entire system. An extensive interchange track with the Erie Railroad will be built at Allegany, N. Y.

Los Angeles (Cal.) Railway will reconstruct Third Street from Main to Traction Street. New girder rail and ballast will be installed. Work will soon start on York Boulevard between Avenue 56 and Avenue 62. The track will be lowered and new ballast put in.

New York, N. Y.—The Transit Commission received bids for land and river borings in connection with the plans for the construction of the Flushing extension of the Corona branch of the Queensboro subway. The lowest bidder was P. J. Heley, $2,944.

Wichita Falls (Tex.) Traction Company, expects to build within the next month two miles of track to the north side of the town bridging the Wichita River with 200 ft. of steel bridge which has already been purchased. This improvement will mean an investment of about $10,000.

Westville, N. J.—The Common Council of Westville, has appointed a committee to confer with the Public Service Railway relative to removing tracks to the center of the borough streets. The tracks are now on the extreme western section along the Delaware River.

Detroit (Mich.) Municipal Railway is continuing the extensive repair work, rehabilitating the former Detroit United Railway tracks and overhead system taken over by the city on May 15. General manager Goodwin is desirous of equipping the new Belle Isle bridge with car tracks to provide for the routing of through cars to the Isle from various parts of the city for a single fare.

The Connecticut Company, New Haven, Conn., will shortly resume operations on the 1½ mile line on North Main Street, Bridgeport, from the present terminus of the North Main line at Wentworth Street, to what is known as the Bethany Chapel switch. The line has not been in operation for the past three years. The company has been repairing the road-bed and tracks.

Winnipeg (Man.) Electric Railway has practically completed the half mile double track extension on Academy Road. In various sections of the city track rehabilitation work is going on. Portions of the track on Osborne Street have been improved by putting in new stone sett liners. Work on relaying the intersections of Main and Dufferin and Main and Euclid is proceeding.

Virginia Railway & Power Company, Richmond, Va., has received permission from the Common Council to remove its tracks from the loop around Broad, Marshall, Twenty-fourth and Twenty-fifth Streets and from other streets on Church Hill where there are duplicate tracks. In return the company must smooth-pave Twenty-fifth Street four blocks. The company will also double-track Jefferson Avenue.

Tacoma Railway & Power Company, Tacoma, Wash., has been directed to pave between tracks on Pacific Avenue, between Twenty-fifth and Twenty-sixth Streets and to repair the pavement between the tracks on north K Street from Division Avenue to north Eleventh Street; south K from Division Avenue to south Thirteenth; Sixth Avenue from south E to south G Streets and north Twenty-sixth from Alder Street to Union Avenue.

San Francisco-Oakland Terminal Railways, San Francisco, Cal., will soon complete the final unit of reconstruction work on the Oakland-Hayward roadbed along east Fourteenth Street because of the arrival of a large shipment of rails. The last unit will cost about $75,000. Double tracking is being relaid along the Key Route Twenty-second Street line at an estimated cost of $5,000. The company is also preparing to spend $130,000 on repaving and relaying of tracks along Telegraph Avenue from Fifty-fourth Street to the Berkeley line.

The Connecticut Company, New Haven, Conn., will start work shortly on the relaying of trackage and roadbed along Union Street, Rockville, Conn. N. J. Scott, manager of the Hartford division, states that the work will cost between $17,000 and $20,000 and will be done by the engineering department of the company. The company is also laying new ties and repairing the trackage on the suburban line from Rockville to Manchester, Conn., and also on the line to Stafford Springs, Conn. On the Union Street job in Rockville, 90-lb. rail will be used, as the section of the track is located on a deep grade and must endure very heavy traffic.

Houston, Tex.—The new interurban line from Houston down the Ship Channel and extending around the shores of Trinity Bay, serving numerous resorts on the water, has been brought nearer to realization by the action of the City Council of Houston in passing the proposition back to the promoters for a revision of plans before granting a franchise. Mayor B. E. Holcombe and other members of the Council say the franchise will be granted as soon as the desired changes in the plans are made. The promoters had already modified their original plans so that instead of using 4 miles of the municipal belt railway track they will use only half a mile, if the franchise is granted.

Indiana Service Corporation, Fort Wayne, Ind., is considering a plan whereby the congested traffic conditions on Broadway near the General Electric plant in Fort Wayne, Ind., during the noon and evening rush hours will be materially remedied. This will consist of the construction of a "Y" at Wall Street and the construction of car storage tracks at Wall and Broadway. The corporation has secured an option on a triangular piece of property at the corner of Wall and Broadway at a price of $25,000 and this property will be purchased at this price provided the board of safety and the board of public works agree to give the traction company a franchise for the improvements. A present considerable difficulty has been experienced at this point when the great number of employees at the General Electric and Dudlo plants are turned upon the streets at noon and evening.

Power Houses Shops and Buildings

Kansas City (Mo.) Railways through its receivers has authorized an addition to the Trainmen's building at Forty-eighth and Harrison Streets. The building can now take care of 225 cars and more than 600 men.

Jackson (Miss.) Public Service Company, through General Manager Brown, has just closed a contract for a new General Electric engine and boiler having 2,500 kw. capacity. The expenditure with auxiliary equipment involves $125,000.

Trade Notes

Okonite Company, Passaic, N. J., manufacturers of Okonite insulated wires and cables, splicing tapes, etc., has recently opened a branch office in San Francisco, Cal., at 509 New Call Building. S. Herbert Lanyon has been appointed manager.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., announces that H. D. Shute, vice-president and general sales manager of the company, has been elected a member of the board of directors of the Standard Underground Cable Company.

The Standard Underground Cable Company, Pittsburgh, Pa., announces that A. B. Saurman, general sales manager for the company, has been elected a vice-president and will combine the duties of his new office with his previous duties.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has changed its Richmond (Va.) representation from a field location to a sub-office. The change was made to meet increased activities at that point. The new office is in the Virginia Railway & Power Company Building, and W. O. Peale is in charge.

O. O. Berry, of the Wheeler-Schebler Company, Indianapolis, Ind., manufacturers of carburetors, was elected chairman of the Indiana section of the Society of Automotive Engineers at a recent meeting. Lon R. Smith, vice-president of the Midwest Engine Company, who has just retired as chairman, was named vice chairman. Bert F. Kelly, of the Weidley Motors Company, was named secretary, and Mark A. Smith, of the Midwest company, treasurer.

The Johns-Pratt Company, Hartford, Conn., whose selling arrangements through the Johns-Manville Company were recently dissolved, has established a Pacific Coast branch of its own. This office, located in the Call Building, New Montgomery Street, San Francisco, will be in charge of A. J. Moan. Mr. Moan was with Johns-Manville Company for a number of years and is familiar with the Johns-Pratt line of Noark fuses and protective devices, Vulcabeston packing and Johns-Pratt molded insulation. To facilitate deliveries on the coast, a comprehensive stock of all lines will be carried at San Francisco.

Heine Safety Boiler Company, St. Louis, has sent a letter of instructions to all of its erecting men in regard to a special kind of service to customers which they are expected in the future to render. This is to visit different installations of Heine boilers from time to time, according to a list to be furnished by the main office, to receive complaints and make recommendations as to ways in which the setting or operation of the boilers can be improved. It is expected that by this plan users of these boilers will realize that the interest of the Heine company in them does not cease with the final payment. The erection engineers are also authorized on these visits to accept orders for repair parts, should they be required.

New Advertising Literature

General Motors Trucks Company, Pontiac, Mich., has issued a twenty-page booklet which serves as a résumé of outstanding features of G M C trucks. The G M C two-range transmission is described in detail.

Hydraulic Society, New York, N. Y., has just issued a second edition of its phamphlet entitled "Trade Standards in the Pump Industry." This edition contains some additional tables and explanatory data and also a revised list of members of the society.

Metals Coating Company of America, Philadelphia, Pa., has issued a pamphlet describing the Schoop metal coating process. Illustrations are given of various uses made by electric railways, such as the coating with zinc of transmission towers, car frames, railway structures, etc.

Briscoe Devices Corporation, Pontiac, Mich., is advertising its Scoe carburetor in a booklet, explaining in detail the phases of its operation. The travel of the carburetor is governed entirely by the quantity of air drawn in by the motor. The pamphlet states that for the medium-priced car, weighing from 2,200 to 2,400 lbs., a mixture of air may be used which will give an average of 20 miles to the gallon.

The Younglove Construction Company, Sioux City, Ia., has been appointed representatives of the Conveyors Corporation of America, 326 West Madison Street, Chicago, Ill., for the sale of American Trolley Carriers in northwestern Iowa, and in South Dakota. The new representatives located in the United Bank Building, Sioux City are well and favorably known in that section of the country as designers and builders of grain elevators, flour mills, transfer houses and coal pockets. The American Trolley Carrier is equipment for handling coal from cars to storage pile or overhead silos by means of monorail and through the use of self-dumping buckets.

Safety in Pressure Tanks—Check Up Your Heating Torches

OIL-BURNING heating torches, which are frequently used on electric railways, involve an element of danger in the pressure tanks which are a part of the equipment. An explosion of one of these tanks seldom has been recorded in recent years and the comparative immunity from explosion has, no doubt, led those in responsible charge to overlook the need for careful, periodical inspection of such equipment with the view toward accident prevention.

Recently a 20-gal. pressure tank supplied by a hand-pump, normally working at 30 lb. pressure, blew up and injured three men seriously. This tank supplied pressure for an oil-burning heating torch used to preheat rail ends. An examination of the tank disclosed a structural weakness in design and manufacture which was the underlying cause of the explosion, although the direct cause probably was the failure of the pressure gage correctly to indicate the pressure.

Sometimes it takes such an accident to rouse one to appreciate a lurking danger and the attention of users of this sort of equipment is called to the necessity for periodical inspection and thorough tests of all parts of such apparatus as well as the establishment of rules governing its use by employees who are trained for the purpose. It will be well, also, to be certain that the construction of the pressure tanks is adequate to withstand the extraordinary pressure to which they may be subjected if gages happen to fail.

No doubt the matter of proper construction of these tanks will be taken up by the Engineering Association in co-operation with the work which the boiler code committee of the A. S. M. E. has undertaken.

Saving Property, a Byproduct of Telephone Dispatching

THE telephone is now so useful a factor in everyday life that it is really amazing that so many electric railway managers should consider city telephone dispatching with indifference. The same men would not dream of walking 50 ft. to talk to another person who had telephone connections, yet they do not admit the desirability of keeping in touch with men out on the line miles away, with most of the company's valuables (cars in operation) in their possession.

The other day two examples of the usefulness of city telephone dispatching, purely as a byproduct, occurred on one property. A crew on reaching the end of a line in a wooded district noticed that a fire in the dry shrubbery had made such headway that it had already set one of the wooden trolley poles aflame. Therefore, in addition to giving the dispatcher his whereabouts, as usual, the motorman described the progress of the fire. The dispatcher at once got into touch with the nearest traveling repair gang. He had heard from the latter but a quarter of an hour before, so he knew what outside telephone he could call up for immediate results. Even if an outside call had proved impossible, he would have heard from the crew within a quarter of an hour at the longest. On the same property and on the same day the telephone report from one crew that it had crossed a trestle just starting to burn led the dispatcher to instruct the following crew to borrow waterpails for the quenching of the fire.

Thus in one day the telephone dispatching system helped to save hundreds of dollars of property and to prevent delay in service and possibly a serious accident. Any user of the telephone for car control could relate scores of incidents of this nature. With telephone material scarcity a thing of the past, telephone dispatching by city railways surely deserves renewed consideration.

Even the Municipal Railway Is Not Boosted

SEATTLE, justly described as "Queen City of the Northwest," is running its own railways, and one might think from this that all classes of citizens would join together to boost the property in increasing its traffic and in other ways. An editorial in the Seattle *Post Intelligencer* for July 15 shows, however, that the amount of help which it gets, at least in this instance, is not very large. The amusing part of the situation is that this paper has been strongly advocating a return by the Municipal Railway to a 5-cent fare.

The circumstances of the case are that a pageant, called "The Wayfarer," was to be reproduced at the Stadium during the week of July 24-29, and this meant that considerable traffic would naturally come to the railway at that time and for the preceding few weeks during the rehearsals. Nevertheless the paper mentioned published in its issue of July 15 the following choice suggestions:

> Six or seven thousand Seattle folk are generously giving of their time—long and tiresome hours—for rehearsals and for the daily production of "The Wayfarer." The great majority of these must use street cars to get to the Stadium. This total street car bill will amount to a contribution of something like $8,000 or $10,000 in actual cash to "The Wayfarer" upon the part of these same people, who are already contributing free their time and energy to making this great pageant one of Seattle's most widely advertised civic assets.
>
> It is only proper that the citizens of Seattle, who indirectly profit by the good done their city in nation-wide "Wayfarer" publicity, should at least share a part of the burden borne so cheerfully by the cast and chorus of "The Wayfarer."
>
> A call has gone out for the donation of automobiles to transport the cast and chorus from their homes to the Stadium for three rehearsals next week and for the six productions during the week of July 24-29.
>
> The call deserves prompt and generous response. If you can spare a little time to give these worthy Seattleites a lift with your car, by all means do it.
>
> Lend a hand—and a gallon of gasoline!

In other words, the advocate of a lower car fare suggests that the municipally owned street railway be deprived of the $8,000 to $10,000 it could use as at least one drop in the bucket toward lower fares. It evidently did not occur to the writer of this editorial that the amateur Thespians could be supplied with street car tokens at a small fraction of the total cost of automobile transportation, especially as most of this load will come outside business hours.

Car Cleanliness Is a Factor in Building Good Will

NO RAILWAY is completely successful if the interiors and exteriors of its cars are not kept in a condition pleasing to the public eye and nose. Next to good painting comes the general cleanliness of all parts of a car if it is to present an attractive appearance.

Where cars are operated in well-paved streets, or where there is very little dust, clean water will do the trick, but where smoke and dust have to be fought, pumice on waste should be used. Special attention should be given to keeping windows and floors clean, as dirt there is especially offensive to passengers. Floors should be well swept and all interior car parts dusted at least daily. If floors are sprinkled with water or sawdust the dust will be prevented from depositing elsewhere in the car. A disinfectant in the water or sawdust is a good thing also. It has been suggested that cars should be swept at the end of each run. This, however, is expensive and is apt to result in deposits of dust on window ledges and consequent complaints from passengers. In new construction or in remodeled old equipment rounded sanitary corners can be introduced and will be found useful in preventing accumulation of dirt in inaccessible places. Proper design of floor strips and careful attention to their layout and installation will also greatly facilitate the work of cleaning.

Make the job of cleaning cars an easy one and the work will be done in a satisfactory manner.

The Faithful Superintendent

WHO has not met him? You will find him most often on a small-town property that has passed, perhaps, through the hands of half a dozen syndicates. Managers have come and gone, some moving to higher places, others flitting on request when financial control changed hands. Through it all, the superintendent has remained. He holds the men together through thick and thin. He asks the local paper to "lay off a bit" when the nagging gets under the manager's skin. He knows every man, woman and child in town and can tell you how many really can't afford to own a gas-droshky.

Most managers respect the sterling honesty and bluntness of these superintendents who are a decade or two beyond them in years. Few managers are willing to believe, however, that these old bears can be taught new tricks. Our observation runs to the contrary. Though the local veteran has been narrowed by being in one place so many years, it does not follow that he is not good for other things than maintenance of discipline and pulling of political wires. There are few men in this world who are not flattered if asked to give their opinion of a new method; and they will surely try harder to make new plans a success, if they have been advised beforehand, than if such plans are thrown at them fully formed and without time for digestion and correction.

We may tell the sequel of one such case. The local manager was anxious to put the advertising touch into his traffic department. Although his superintendent had always declaimed against advertising, he took him into consultation. The old-timer had the chance to examine ride-selling campaigns conducted by other companies, as shown by their newspaper copy, car placards, etc. No one argued with him while he pondered this material. Finally, he said: "Say, you can't start this kind of stuff too soon for me; and what's more, I'd like to have the chance to handle it myself with the boys and the public from soup to nuts. I thought street railway advertisin' was just framin' excuses for not makin' good. But this is somethin' else again. Lead me to it." And so new wine has been poured successfully into an old bottle!

New England Roads Making Earnings Records

COMMENT was made early in the year on the good news coming out of New England contained in the annual reports of some of the larger companies. As a record of the past these reports were very satisfactory, but it was in the promise for the future that these documents were most inspiring. Another six months has rolled around. Another period of accounting is at hand. The figures for the half years are not presented with the formality that accompanies the publication of the reports for the full year and they lack the helpful comment which goes with the reports for the calendar year, but they are nevertheless an accurate record of achievement.

All of the three big systems—the Boston Elevated Railway, the Eastern Massachusetts Street Railway and the Connecticut Company—show very distinct progress. For the first time in more than eleven years the Boston Elevated Railway does not owe a dollar to the banks. In fact, it has more than $3,000,000 in cash on deposit. In the first half of the year the road earned more than $1,000,000 in excess of dividends and has just made an initial payment of $517,196 on account of the municipal loan assessment of 1919.

As for the Eastern Massachusetts Street Railway, that road has just declared a dividend of 3 per cent on the sinking fund stock and first preferred stock, Series A. Just three years ago the road was placed in the hands of the trustees a financial wreck. The rehabilitation has been brought about chiefly by the use of one-man cars and the discontinuance of lines where the towns did not care to consider paying their share of the possible operating deficit.

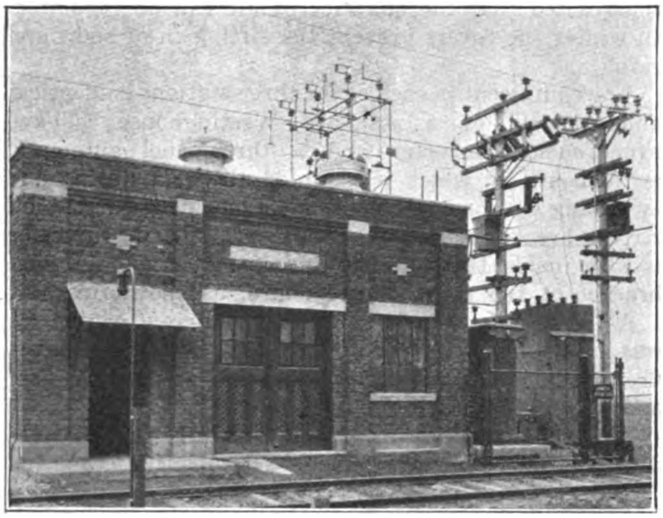
As for the Connecticut Company, it is doing so well that the sum of $781,411 has been paid by it to the State as the first installment of taxes on an accumulated sum of about $2,000,000. It is the first payment made by the company to the State on account of taxes since 1917. This might be considered by some to be a negative figure. It is. But it is none the less significant as a barometer.

There are still some factors present in the situation in New England that are working against the roads there, but there are so many other factors favorable to the companies that progress in the next six months is not likely to be seriously retarded.

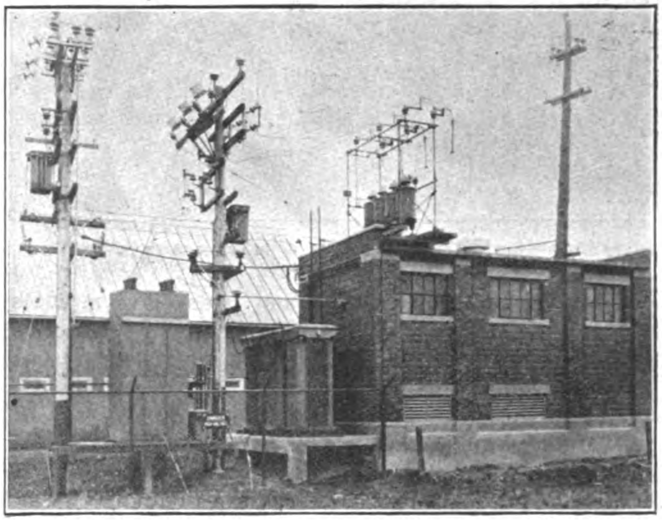
Substation Layout of an Ohio Railway

The Columbus, Delaware & Marion Electric Company Uses Three Automatic Substations on Its Interurban Lines, Operating in Conjunction with Two Manual Substations—Some Details of Design and Construction Are Given

By R. P. Meily
Sales Engineer Westinghouse Electric & Manufacturing Company



AUTOMATIC SUBSTATION AND WAITING ROOM AT RADNOR, LOCATED ON A 2 PER CENT GRADE. NOTE THE SIGNAL LIGHT OPERATED FROM WAITING ROOM BY PROSPECTIVE PASSENGER



REAR OF RADNOR SUBSTATION, SHOWING LOCATION OF TRANSFORMERS, SWITCHBOARD AND HIGH-TENSION EQUIPMENT AND THE ELECTROLYTIC LIGHTNING ARRESTERS ON THE ROOF

THE Columbus, Delaware & Marion Electric Company has recently completed the installation of three automatic railway substations which operate in conjunction with the manually operated station at the Scioto power plant and the Marion City substation.

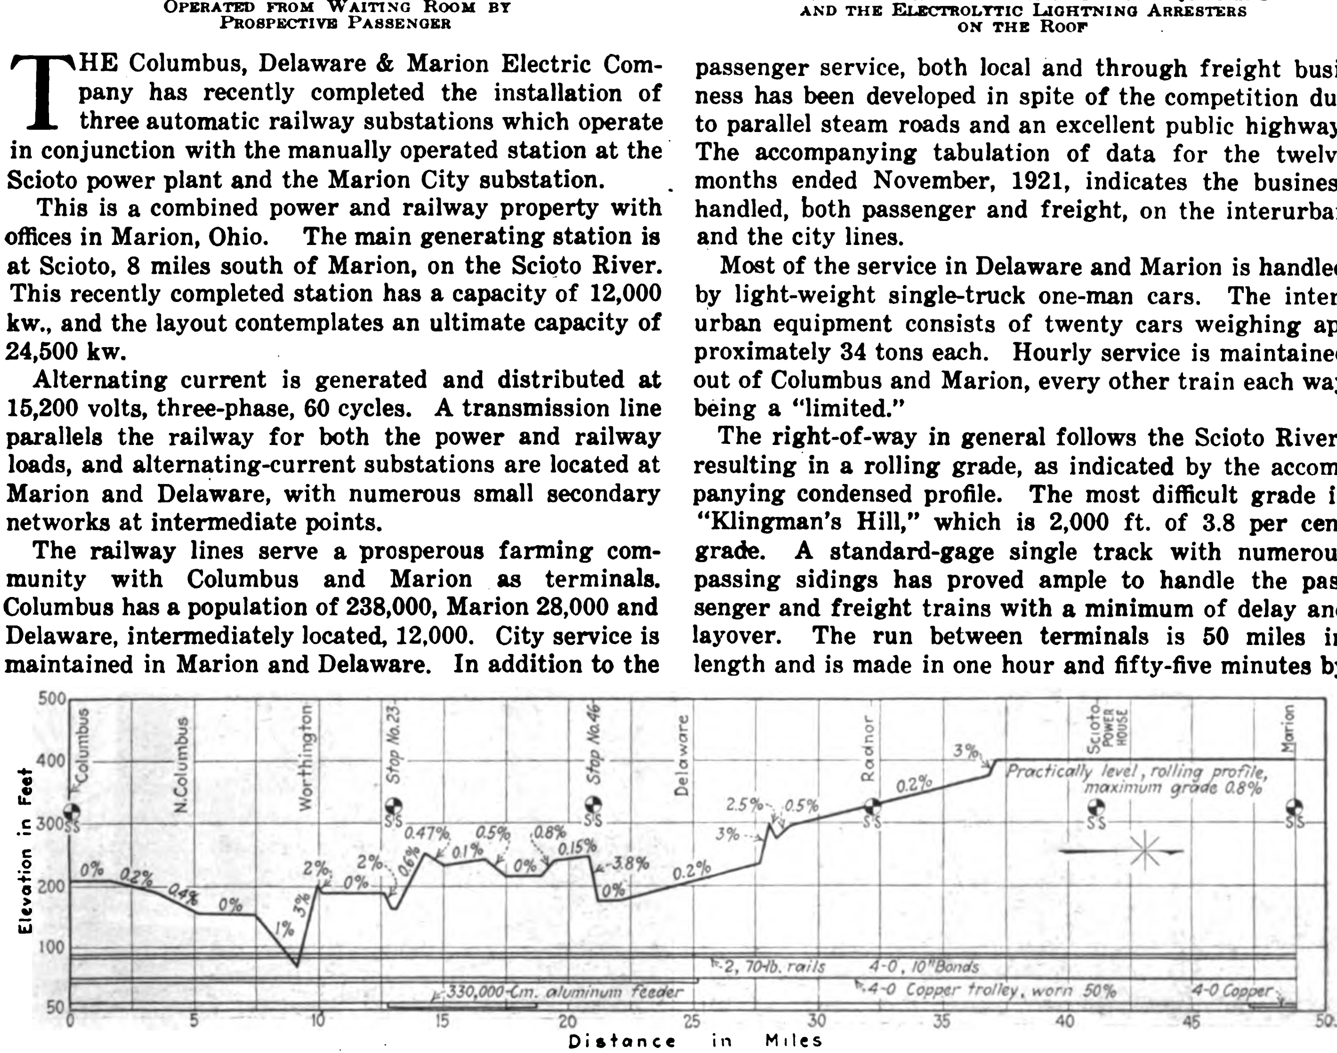
This is a combined power and railway property with offices in Marion, Ohio. The main generating station is at Scioto, 8 miles south of Marion, on the Scioto River. This recently completed station has a capacity of 12,000 kw., and the layout contemplates an ultimate capacity of 24,500 kw.

Alternating current is generated and distributed at 15,200 volts, three-phase, 60 cycles. A transmission line parallels the railway for both the power and railway loads, and alternating-current substations are located at Marion and Delaware, with numerous small secondary networks at intermediate points.

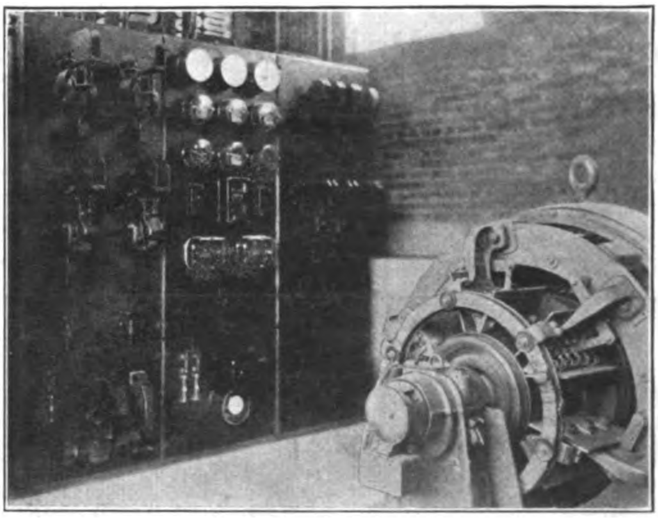
The railway lines serve a prosperous farming community with Columbus and Marion as terminals. Columbus has a population of 238,000, Marion 28,000 and Delaware, intermediately located, 12,000. City service is maintained in Marion and Delaware. In addition to the passenger service, both local and through freight business has been developed in spite of the competition due to parallel steam roads and an excellent public highway. The accompanying tabulation of data for the twelve months ended November, 1921, indicates the business handled, both passenger and freight, on the interurban and the city lines.

Most of the service in Delaware and Marion is handled by light-weight single-truck one-man cars. The interurban equipment consists of twenty cars weighing approximately 34 tons each. Hourly service is maintained out of Columbus and Marion, every other train each way being a "limited."

The right-of-way in general follows the Scioto River, resulting in a rolling grade, as indicated by the accompanying condensed profile. The most difficult grade is "Klingman's Hill," which is 2,000 ft. of 3.8 per cent grade. A standard-gage single track with numerous passing sidings has proved ample to handle the passenger and freight trains with a minimum of delay and layover. The run between terminals is 50 miles in length and is made in one hour and fifty-five minutes by



PROFILE, SUBSTATION LOCATIONS AND FEEDER LAYOUT ON THE COLUMBUS, DELAWARE & MARION LINES



Interior of Columbus, Delaware & Marion Automatic Substation, Showing Switchboard and Converter

the limiteds and in two hours and twenty-five minutes by the locals. Five miles of this run is in Columbus proper and represents a half hour of the running time.

The portion of this mileage which is under automatic substation control includes all of the trackage south of the Scioto power plant, exclusive of the portion in Columbus, which is fed by the Columbus Railway & Light Company, over whose tracks the Columbus, Delaware & Marion operates. An interchange of power is effected near Stop No. 3, the trolley wire not being sectionalized for the present operation.

The map profile shows also the general layout with substation locations and copper distribution. In locating the stations, with regard to voltage regulation and copper economy, it was found that the locations thus determined could be made to serve as stops for the local trains. Accordingly it was decided to provide a waiting room in the same structure, by extending the building lengthwise to provide additional space 6 ft. x 12 ft. for this purpose.

By reference to the plan view of the station it will be seen that the only openings between the station and the waiting room are two louvers. The louvers are 2 ft. x 4 ft., one being placed near the floor and the other near the ceiling. By means of these openings an air circulation is obtained, the heat given off by the machine passing into the waiting room through the top louver and back into the station through the lower one. The absence of other openings, except the small open doorway, causes the temperature of the waiting room to be several degrees higher than the outside air, by means of this natural circulation. The small difference in temperature is quite apparent, and the idea has worked out very well.

It will also be noted that louvers have been placed in the back of the building. These are for the purpose of providing better circulation in summer. They are provided with sheet-iron box covers located inside and so constructed that the quantity of air can be regulated. In winter the covers prevent the sifting in of snow and rain.

The equipment in each of the three stations is identical and consists of a standard Westinghouse 500-kw. synchronous converter and a three-panel automatic switchboard on which is mounted all the metering and switching equipment except the alternating-current oil circuit breaker. The direct-current lightning arrester is also inside the building and is mounted on a wall bracket at the right of the board, as shown in plan.

All of the high-tension alternating-current equipment was placed out of doors. This not only reduced the fire and other risks to a minimum but lessened the cost and size of the building.

The transformers were swung from a flat car directly into position with the company's locomotive crane, as was the switch house. Should a transformer failure occur, the transformer can be replaced with a spare with a minimum of time and labor. The transformers rest on rails laid on a concrete platform, built as a continuation of the station floor.

The switch house is a sheet-iron cabinet which protects the automatic oil circuit breaker and the alternating-current metering equipment. The front and back of

OPERATING DATA FOR FISCAL YEAR ENDED NOVEMBER, 1921, COLUMBUS, MARION & DELAWARE ELECTRIC COMPANY

Main Line	
Passenger car-miles	818,042
Freight car-miles	152,166
Passengers, revenue	2,069,208
Passengers, transfer	247,478
Delaware City	
Car-miles	195,861
Passengers	486,500

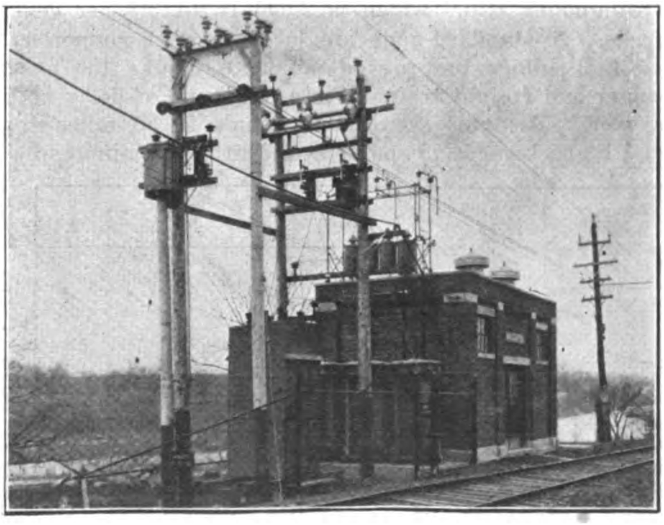
Car-miles	451,902
Passengers	2,667,585



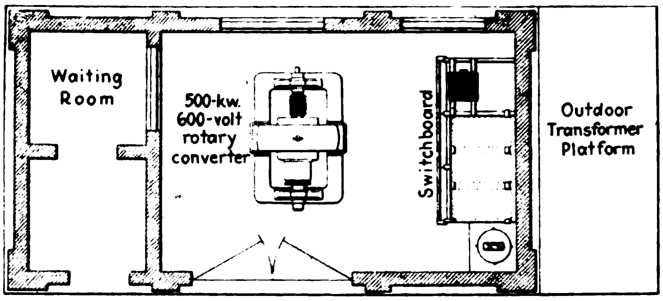
Another Type of Automatic Substation with Waiting Room Entrance at Side. Located at Stratford

Another View of Stratford Station Showing Waiting Room Entrance and Signal for Car this house are hinged and can readily be thrown open for inspection.

Two types of pole structure were used in the line construction. The four-pole type is preferred, as the "disconnects," choke coils, operating transformer, etc., are less crowded than with the two-pole type. More room is available for guying the poles, also, and the general appearance is more pleasing.

The small transformer shown on the switch-house patform is the potential transformer for the alternating-current metering apparatus. The operating transformer is mounted on the pole structure. Electrolytic lightning arresters, which require charging once a week, are mounted on the substation roof. A high wire fence protects the outside equipment and prevents possible injury to passers-by.

Another feature which may be mentioned is the signal lamp operated by a passenger waiting for a local car. The circuit is controlled by a push-button in the waiting room and lights a blue lamp notifying the motorman to stop for passengers. Another is a small lamp mounted over the substation window. This lamp is lighted when the station is in operation. In the event the station failed to start, the motorman of a passing car would notify the train dispatcher by means of a telephone located in the waiting room.



Waiting Room
500-kw. 600-volt rotary converter
Switchboard
Outdoor Transformer Platform

PLAN OF TYPICAL AUTOMATIC SUBSTATION WITH WAITING ROOM IN ONE END

From the operating point of view these stations have proved highly successful in maintaining an over-all efficiency of approximately 85 per cent. A careful inspection of each station is made once each week, at which time the lightning arresters are charged. The stations were designed and erected by the Columbus, Delaware & Marion Electric Company.

How Accidents to Employees Are Being Reduced on Chicago "L"

Influence of Officers and Management an Important Part in Results Obtained—How Employees' Observations of Accident Breeding Conditions Are Habitually Turned to Corrective Measures Is Told

BY B. J. FALLON
General Manager Chicago Elevated Railroads

WITH the reorganization of the safety work on the Chicago Elevated Railroads in January, 1920, a safety department was instituted and a safety engineer placed in charge of the work. The company had been doing safety work for a number of years, and in the reorganization it was the idea of President Britton I. Budd that the work of accident prevention should be intensified and that it should be in charge of one man whose sole duty would be to carry on a comprehensive safety campaign 365 days a year.

The foundation of the Chicago Elevated Railroads' plan for accident prevention is the development of the powers of observation of the employees of the company to such a point that their attention is immediately attracted by any condition or practice that is hazardous or likely to become so. By this plan it becomes a habit for them to be constantly on the alert for these conditions and either to take steps to correct the condition or to report it to the proper authorities and to see that the condition or practice is corrected before an accident happens.

The employees are impressed with the idea that their co-operation is sought to prevent accidents to themselves and to others by keeping safety always in mind. They are brought to realize that the prevention of accidents is alike a moral, a humane and a public duty owed by all.

A system of employees' safety committees was installed in 1920, and we have at present fourteen of these committees holding meetings twice a month for the consideration of safety suggestions and accident prevention in their several departments. These committees are selected from the rank and file of the men and none of the supervisory force is a member of any of these fourteen committees nor does any member of this force, other than the safety engineer, meet with these committees.

There are five division safety committees, one on each of the divisions of the elevated lines, made up of the superintendent, master mechanic, general foreman, electrical foreman and the claim adjuster for the division. These committees hold meetings twice a month on the days following the meetings of the employees' safety committees. A central committee of five members, the assistant general superintendent of transportation, the engineer maintenance of way, the superintendent of shops and equipment, the electrical engineer and the safety engineer, hold meetings monthly or oftener if necessary.

Safety suggestion cards are provided and placed in all shops and at all terminals for the use of employees in making suggestions. These cards are sent to the chairman of the employees' safety committee of the department that is directly concerned in the proposed change and this committee acts on these suggestions at its meeting, either approving or disapproving each suggestion and giving the reasons for the action taken. The suggestion then goes to the division safety committee at its next meeting and is acted on in the same manner.

In this latter committee are the heads of the several departments on the particular division and in all cases involving an expenditure of less than $100 an approved suggestion can be immediately carried out. In cases involving an expenditure of over this amount or where a change in the policy or method of operation is involved the suggestion goes to the central safety committee for final action.

After suggestions have been acted upon by the employees' and division safety committees, they are sent to the office of the safety engineer. Immediately on receipt of this suggestion in this office an acknowledgment form is filled in and mailed directly to the proposer of the suggestion advising him of its receipt and stating that he will be advised as soon as possible of what is done with it. When a suggestion is finally disposed of the proposer receives a letter from the safety engineer telling him of the disposition made. If it has been disapproved the proposer is told why and invited again to take the matter up personally or by letter with the safety engineer if he is not satisfied with the reasons for the disapproval.

In this way we have succeeded in securing the co-operation of the employees because they feel that their ideas receive the recognition due them. In some cases where the employee was skeptical of the actual intent of the company in the safety work, we have succeeded in convincing the man of the real worth to the company of his ideas as well as the benefit to be derived from them by himself and his fellow employees.

The suggestion plan has been successful not only in securing a large number of good safety ideas, but it has taken hold of the employees to such an extent that they are constantly reporting conditions or practices that need immediate attention to their superiors or the safety engineer without waiting for a meeting of the safety committees. In this way a great many small accidents are avoided and the shops, roadway and equipment are under constant inspection by a large number of employees, each considering it his personal business to see that conditions or practices that are likely to cause accidents are taken care of immediately.

The question of the value of the average suggestion received is answered by the following figures, covering the years 1920 and 1921:

Total number of suggestions received.	3.515
Number of suggestions approved.....	2,390 or 68 per cent
Number of suggestions disapproved...	984 or 28 per cent
Number of suggestions now pending..	141 or 4 per cent

During the year 1921, 427 safety committee meetings were held in addition to the monthly meetings of the several departments for their own employees. Two hundred and forty employees each served four months on the safety committees during the past year and these, together with the 242 employees who served during the preceding year, have received a liberal safety education and are assisting in the education of their fellow employees in accident prevention and first aid.

In September, 1921, the plan of giving instruction in first aid to the members of the employees' safety committees was adopted and is now in operation.* Each employee serving on a safety committee receives detailed instruction in first aid work including the Schaefer prone method of resuscitation. As a result of this plan it will be but a short time until there will be several men in every gang of workmen, and at least one man on every train, that is a trained first aid man, able to give instant aid in any kind of an accident.

A uniformed first aid team has been trained and aids in the instruction of the employees as well as giving demonstrations in public. A training school for first aid men has been established and classes of twenty men receive two hours instruction a week for eight weeks and at the end of this period are given an examination by the American Red Cross and receive a certificate as a first aid instructor in the Red Cross.

Over two hundred first aid stations are maintained on the elevated property and at thirty places a stretcher and blanket are kept in a weather proof container.

The number of cases of infection resulting from the neglect of small injuries has been materially reduced by the first aid instruction and the propaganda in the form of notices regarding immediate treatment of all injuries, no matter how slight, at a first aid station.

Every accident reported on the elevated lines is closely investigated and steps are immediately taken to prevent the recurrence of an accident of a like nature. The results are shown in the accompanying table.

Over 200 of the employees attended the foremen's safety instruction course and the safety supervisors' schools held by the Chicago Safety Council during the past six months and of this number 117 received certificates of graduation for attending at least 75 per cent of the meetings. All of these council meetings are held in the evening and the men attend them on their own time and of their own volition. The company safety meetings are held on company time.

CHICAGO ELEVATED RAILROADS, COMPARATIVE STATEMENT OF LOST-TIME ACCIDENTS TO EMPLOYEES, JANUARY TO JUNE, 1921 AND 1922.

	1921	1922	Per Cent Inc.	Per Cent Dec.
Average number of employees in service (monthly)	5,396	5,288	.....	2.00
Total revenue car-miles	16,898,794	17,575,630	4.00	....
Total revenue passengers	61,820,938	61,435,300	.....	0.62
Total number of lost-time accidents to employees	73	56	.....	23.30
Total number of days lost account of accidents	572	346	.....	37.70
Car mileage per lost-time accident (to employees)	231,490	313,851	35.40	.....
Passengers carried per lost-time accident to employees	833,163	1,097,059	31.70	.....

In the tabulation of the number of accidents shown below, the lost time accidents are those of sufficient seriousness to incapacitate the employee for work for eight hours or longer.

To educate the employees we have found it is necessary to have the active co-operation of the supervisory force and the officials, for in safety work as well as in the other phases of industry the attitude of the employees but reflects the attitude of the employer. On the elevated lines the officials and supervisors consider that they are responsible for the protection of employees from injury and accidental loss of life. To see that they are properly cared for when injured, to investigate the cause of injury and to take steps to prevent further injuries of a like nature are considered just as much a part of official duty as is the efficient operation of a department of this railway.

To obtain the employees' co-operation in accident prevention, the supervisory men have shown the employees that their superiors are behind the work, heart and soul. Any recommendations that employees may make that will tend to reduce the hazards and increase the safety of working conditions are closely investigated and if found practicable are carried out with the least possible delay. A budget allowance of $50,000 a year for carrying out safety suggestions has been provided this year and last.

---

Good Results from Safety Campaign

Safety Committees Have Been Organized, Competition for Accident Reduction Is Keen and a Bonus Is Offered for the Best Records

By W. Auten Brown
Supervisor of Schedules Nashville Railway & Light Company

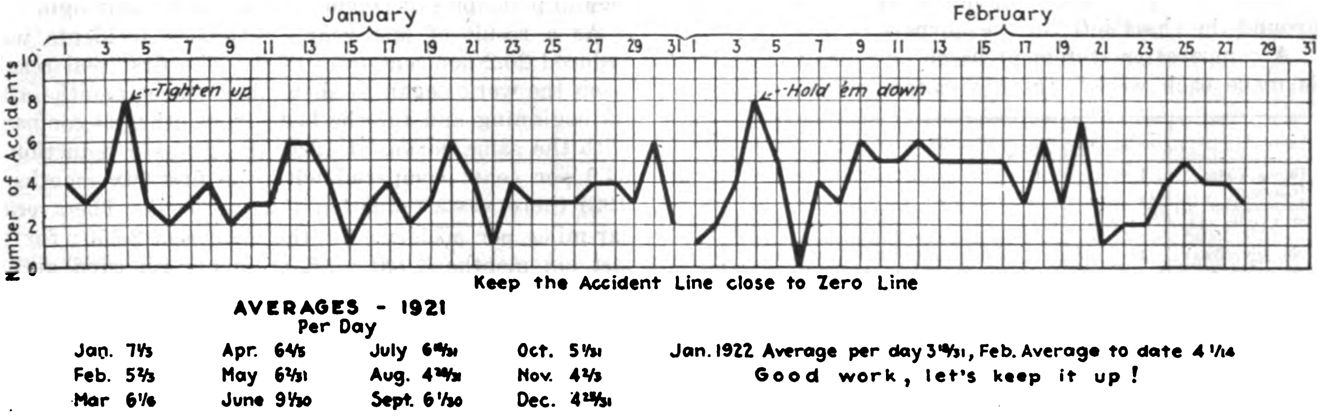
THE initial efforts of what proved to be a very successful campaign for the prevention of accidents on the property of the Nashville Railway & Light Company were made about March 1 of last year.

There were conditions on the property that had had the effect of greatly increasing accidents during the latter part of 1919 and the first eight months of 1920. In August, 1920, a strike took place, and it became necessary to replace about 60 per cent of the platform men. Naturally with the unsettled conditions that followed and with a large number of inexperienced men, accidents continued to increase during the next few months. It was this, coupled with the high cost per accident—occasioned by circumstances common in varying degrees to our industry—that brought about the necessity for some action.

A meeting of all employees, called by H. A. Davis, superintendent of the railway department, for a discussion on how to reduce accidents was the first real move. Charts showing accident records had been posted, but up to this time had not been very effective. At this meeting, which took place on March 29, Mr. Davis made it clear that something had to be done to reduce accidents. At the same time, he pointed out the advantages which would accrue to both employees and the company by avoiding accidents and saving money. Other speakers at this meeting were the master mechanic, the barn foreman, a schedule man, a motorman and a conductor. Each briefly discussed from his point of view the prevention of accidents.

Other meetings followed, under the guidance of Mr. Davis. Men from various branches of the operating department were the speakers. There would always be two meetings, one at 1 p.m. for the night crews just before going on duty, the other at 3 p.m., for day men. An effort was made to have an experienced motorman and a conductor on the program at every meeting, and though sometimes lacking in certain of the essentials of oratory they got their ideas across in a way understood and appreciated by their fellow workers. Some excellent speakers were discovered, among them the present supervisor of safety, J. S. Patrick, who was then a member of the claim department. Probably one of the best results of this manner of meeting was that when a man once spoke on the platform he immediately became an ardent safety man and seldom afterward had a serious accident.

These meetings are still being held. They have become an institution to which the men look forward eagerly. They are made interesting from the employees' point of view—and to quote another writer on this subject, they are "Snappy and not overdone." Cigars and refreshments are sometimes served to add to the attractiveness.



Sample Chart of Accident Record as Drawn on Bulletin Board

After the appointment of the safety supervisor in August, 1920, the movement began to take more definite form. Two safety committees were formed from each division of the system, one from among the day crews and the other from the night crews. A motorman or conductor from each line of the division represented makes up the personnel. These committees serve for a period of two months and meet twice each month with the supervisor.

The duties of the committees are: (1) To investigate and study any unusual or serious accident occurring on their division, (2) to consider and pass upon safety suggestions received, and (3) to make memoranda of any unsafe practices, defective equipment or track, and report them at once to the supervisor, who takes them up with the proper officials or department.

Some valuable suggestions have come from these men, who are in constant contact with the equipment, track, the public and other members of the "hazard" family, that must be closely watched to bring accidents to a minimum. Every suggestion, regardless of its degree of importance, receives careful consideration. Credit is given or notice is taken of those whose suggestions are found useful or who render good service. This is done in a manner benefiting the individual case and with a view of encouraging further endeavors.

The supervisor has an opportunity in these meetings effectively to educate and bring the men to an appreciation of the importance of safety.

The term of service on the committees is made as short as is consistent with the possibility of developing the interest of each member and giving him an opportunity to accomplish something. With this procedure the committees are kept active with new blood, and every two months forty keen advocates of safety are turned out.

Another method of engaging the interest of the men is by the use of a chart somewhat similar to that shown on page 157. On this chart, which is painted on a blackboard 9 x 4 ft., conspicuously located, the accidents of the preceding day are recorded by a line which goes up or down with their fluctuations. After solving the "mystery," the novelty of being able to read the thing made it all the more interesting to some of the men. It is watched with keen interest, and when the line goes up it has the effect with many of them of producing extra precaution. Comparisons of previous months and pertinent comments are made on space around the chart left for the purpose.

A comparative statement based on miles per accident is made each week. In this statement the records of divisions are compared. Copies furnished to the division superintendents are also posted on the bulletin boards. Much friendly rivalry has been created and the superintendents and their men take much pride in making a good showing for their respective divisions. As interest grew and competition became keen, there was added another board with a table, showing the lines grouped by divisions. On this is kept a daily record of the number of accidents occurring on each line. By the use of two colors of chalk, the day and night shift accidents are also shown separately.

TABLE OF ACCIDENTS BY DAYS AND ROUTES POSTED ON BULLETIN BOARD

To show their appreciation of the good records made and as an additional incentive to continue them, the management last September offered, as a prize, a turkey to each man having a perfect record from Oct. 1 to Dec. 23. The only accidents not chargeable against this prize were those where a vehicle or other object came in contact with the car three or more feet behind the front doors or one with which the car had no connection though occurring near it. At the end of two months about ninety men had been eliminated. A great many of these accidents had been of such trivial nature, however, and many of them not the fault of the car men, that, with the consent of those who had clear records, "the slate was wiped clean" and a new start was made with about thirty days to go. At the expiration of this time only five men had chargeable accidents. They were "forgiven" and every man received a turkey. These three months proved the best of the year.

The public was not forgotten in the campaign and was told of the work through the usual publicity channels. We believe that one result was a reduction of accidents of "auto coming out of the pocket" type. No doubt other accidents were also avoided. Those that do not happen are intangible, and it would be difficult to determine just what prevented them. We believe that educating the public is one of the fundamental principles of conducting a safety campaign.

As a result of last year's activities accidents were reduced 20.2 per cent over 1920. The first real results from the work began to show about three months after its beginning and for the last six months, as compared with the same period of 1920, there was a reduction of 34.9 per cent; compared with the first six months of 1921 there was a reduction of 21 per cent. The average car-miles per accident for the year was 2,350; for the last six months 3,049. All accidents reported are included in these averages, as well as derailments, with or without damage or injury. All classes of accidents decreased, excepting boarding and alighting. These showed a slight increase, offering more food for thought. There was only one fatility in the railway department, as compared with five for the year 1920.

While a great record was made last year, especially during the last six months, the first month of this year has shown more improvement—in fact, was the best month on record. There were more than 4,000 car-miles per accident and only 111 accidents, as compared with 225 last year. To effect further savings, a "profit or dividend" sharing contest has been organized. The platform and carhouse men have been divided into four teams with a captain and three lieutenants for each. The captains selected their teams by drawing the names one by one from four groups, namely, operator (one-man cars), motormen, conductor and carhouse men. The contest will continue through the year but will be divided into four periods of three months each. New captains and teams will be selected at the end of each period.

The company has offered a bonus of $10 for each unit of accident decrease this year. This bonus is paid irrespective of the class of accident. To illustrate: The total number of accidents for the first three months last year was 585. If the total this year is 335, the bonus found will be $2,500, which will be divided among the teams as follows: Winning team, 50 per cent; second team, 25 per cent; third team, 15 per cent, and the last team 10 per cent. Each member will receive an equal share of the amount due his team.

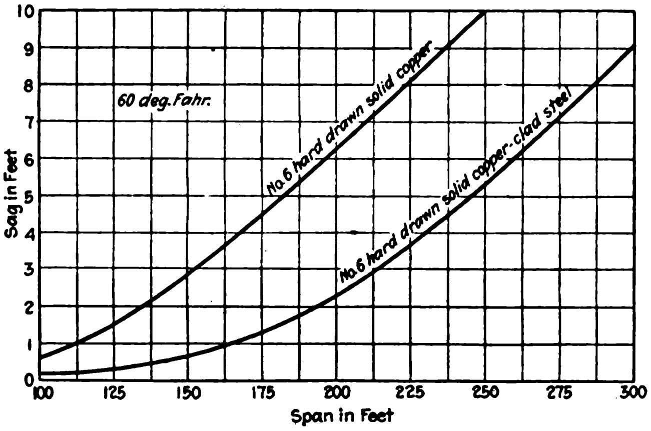
From a humanitarian standpoint, the value of accident prevention cannot be estimated. With the big dividends it pays in money and good will, when properly directed, it is good business.

Copper-Clad Steel Wire Advocated

The Non-Corrosive Qualities, Great Strength and Low Cost of Copper-Clad Steel Wire Make It Useful for Long Spans and Rural Lines Where Wind and Sleet Loads Are Severe

AN ARTICLE giving considerable data in regard to the use of copper-clad steel wire appeared in the *Electrical World* for July 22, 1922, over the signature of B. C. Dennison of the Carnegie Institute of Technology. The following information is taken from this article:

Normal copper-clad steel wire is about 8 per cent lighter than copper and has a breaking strength exceeding that of copper by an amount varying from 20 per cent for the larger sizes (No. 4/0) to 55 per cent for No. 12. Stranded cables of copper-clad steel may be expected to be at least 50 per cent stronger than the corresponding cables of hard-drawn copper. A so-called "extra-high-tensile" copper-clad steel wire now on the market has a tensile strength 150 per cent greater than copper owing to the use of a high-carbon steel core.



COMPARISON OF SAGS FOR VARIOUS SPAN LENGTHS. THE GRAPHS ARE BASED ON ½-IN. ICE LOAD AND 8 LB. PER SQUARE FOOT WIND LOAD

Obviously, copper-clad steel wire cannot always be substituted for copper to advantage. Its general field of usefulness is in those applications where the size of wire is determined by requirements of mechanical strength rather than conductivity, or where galvanized wire is subject to corrosion and depreciation.

For long spans where the strength of hard-drawn copper is insufficient the copper-clad steel wire finds a ready application. Compared with silicon-bronze or phosphor-bronze wire, copper-clad steel has about the same strength and conductivity with materially lower first cost. Extra-high tensile-strength copper-clad steel adds to the advantage of lower cost a strength twice that of bronze.

In the support of telephone and signal cables, in carrying trolley feeders over streams and rights-of-way, and in general for carrying the weight of wires which require messengers, the copper-clad messenger strand has an advantage over galvanized-steel cable in that it is free from rust and deterioration. In railway tunnels or other places where corrosive gases are present this advantage is especially pronounced. Another use for such messengers is in the support of trolley wires in catenary construction.

The size of conductor for rural lines is frequently determined by considerations of safety from breakage due to wind and sleet loads rather than by conductivity. Thus, compared with solid copper wire, No. 6 copper-clad might frequently replace No. 6 hard-drawn copper with a saving of 30 per cent of the poles and insulators because of the use of longer spans, although strung with the same sag and possessing equal safety. Some saving in the cost of the conductor would also result because only 92 per cent as great a weight of wire would be used and the cost per pound would be less. The accompanying graphs show a comparison of sags in No. 6 conductors with various span lengths.

In high-tension distribution in city streets the necessity for safety makes possible the use of copper-clad steel conductors. In street-lighting circuits, for example, the current could be transmitted by a very small copper wire, yet safety requirements may force the use of No. 6 wire. A No. 8 copper-clad steel wire would give the same mechanical strength, give satisfactory conductivity and cost less.

In his *Electrical World* article Professor Dennison gives data referring particularly to the copper-clad steel wire made by the molten method by the Copper-Clad Steel Company of Rankin, Pa. In this method, after the steel ingot has been brought to a welding temperature within a graphite mold, molten electrolytic copper is poured around the steel, and as the two metals cool a composite cylinder of copper firmly welded to the steel core results. Three general grades are produced, 40 per cent conductivity, 30 per cent conductivity and mechanical grade. As suggested by the name, 40 per cent conductivity grade has 40 per cent the conductivity of pure copper of the same gage number. Mechanical grade has no guaranteed conductivity, but corresponds to a conductivity of about 25 per cent. An interesting development is a composite cable made of strands of pure copper and copper-clad steel wire. This makes a cable which has high conductivity and great strength which fills in the gap in conductivity between the 40 per cent copper-clad steel and copper.

Safety Advertised in Oakland

THE activity of the San Francisco-Oakland Terminal Railways, through a local organization known as the East Bay Safety Council and in other ways, has already been mentioned in these columns. The East Bay Safety Council was organized on April 28, as mentioned in the issue of this paper for June 24, and its activities were launched by a parade of Boy Scouts on May 27. A practical contribution of the railway company to the accident prevention cause is the special car illustrated. This car has on its sides and end panels a series of safety injunctions and is being operated in the regular service on the various lines of the company.

Getting Rid of Paving

How a Wisconsin Company Proved to a Municipality That This Obsolete Tax Was an Impediment to Good Service and Got It Removed

By N. C. Rasmussen
Superintendent Wisconsin Valley Electric Company, Wausau, Wis.

THE paving of streets and portions of streets by electric railways is a serious burden under our present franchise system. As everybody knows, this obligation is a relic of the old horse car days. When horses were used there may have been some justification for it, but since the advent of electricity as a motive power, this charge should not any longer be carried by the electric railways.

From 1910 to 1914, which were the worst years in the history of our company, considerable paving was done by the city in which we operate, and our company had to bear its share of the cost and upkeep of this paving, although it was being used by the automobiles, which were taking away passengers from our cars. Naturally things looked rather gloomy to us.

During 1915 we decided that something would have to be done, and we looked around for a remedy. We finally decided to try operating our cars with one man, and we rebuilt some old equipment for one-man operation, and in November, 1915, we started to operate our city cars with one man. The result was so gratifying that on Jan. 1, 1916, we began one-man operation of our suburban cars during the light hours of the day, using two men during rush hours on these suburban cars. For four years the interurban cars have been operated successfully in this way.

In January, 1920, our city administration asked us to build two extensions, each about one-half mile in length. We realized that these extensions should have been built before and several petitions had been presented to us for their construction, but we were unable to see where we could realize any return on the investment and therefore had been obliged to decline. When the city administration finally asked us to make these extensions, the management of the company instructed the writer to try to find a solution. At that time, which was about a year after the armistice had been signed, we were enjoying a good patronage on our cars, to some extent probably because we had not made any material increase in fare. The only change made was to cut out all the reduced rate tickets, so as to charge a straight 5-cent fare. We were operating in the city on a fifteen-minute schedule which would seem to be reasonably good service in a city of 20,000 population. The writer was very optimistic, however, about the street railways coming into their own again and made a recommendation to the management to build the extensions asked for and also double track 1 mile of existing single track and put on enough additional cars to give a ten-minute service in the city instead of one every fifteen minutes, and a twenty-minute suburban service instead of one every thirty minutes as we had been doing. This would mean that we would have to buy four new cars, and of course material for the extensions and rebuild this 1 mile track at peak prices.

At first this seemed a startling proposal but after it had been thoroughly examined the company decided to adopt it provided the city would consent to relieve us of the paving burden. The proposition was placed before the Mayor, who finally decided to submit the matter to the Council. The writer attended the Council meeting at which the plan was presented, and after thoroughly explaining it agreed for the company to hold the fare as low as we could but not binding ourselves to any certain fare. In the vote which followed only two out of the eighteen aldermen cast their vote against the adoption of the amendment to our franchise in the form in which we put it before the Council.

HOW OPPOSITION WAS OVERCOME

There was, of course, considerable agitation against this action of the Council from the socialists and labor unions, and the writer was the center of much discussion when the city election was held that spring. The opposing parties spread a good deal of propaganda that after we got rid of the old franchise and fulfilled our promise to the city of building the extensions and putting on additional service, we would increase the fare. On hearing this I went into the enemy's camp and had a heart to heart talk with some of the leaders, and very little was said about the matter after that. Finally when election day was over, we found that although several socialists were elected, the two aldermen who had voted against us were the only two of the old Council who were defeated, and now after more than one year of operation under this new arrangement there is a great deal of favorable comment on the service rendered and also the fact that we have not raised the fare above 5 cents.

We have also been commended by the labor element in the city, as we have not followed the practice general in other industries of cutting wages to a great extent. In fact, we have not cut any of our regular men, either on the cars or in other departments. Our motormen are being paid higher wages than in many cities larger than ours and are contented. This is proved by the fact that we have not changed a single trainman in the last year, and of all the old men who were with us before the new system was inaugurated, not one has left the service. When the new system was put into effect we had to engage eight or ten new men, but since November, 1920, after we got them broken in, we have lost only one man and he had been with us only a short time.

During the first year's operation under the new arrangement traffic has increased in proportion to the additional service put on, and although the railway department is making only a moderate return on the investment we feel the present arrangement is more satisfactory than the former under which we were obliged to pay for all new paving and maintenance of old paving in the track area. The feeling between the company and the public is better than it has ever been, and what this article is intended particularly to bring out is that when the facts are properly placed before the public and the cards put on the table face up, the American public will be fair. The writer holds the same opinion as E. M. Walker, that a car in sight at all times in the solution of the elimination of the jitney, and people who would walk if no car were in sight will now ride.

It might be well to say that our suburban cars which now operate on a twenty-minute schedule as against thirty minutes under the old arrangement are double-truck cars, which were changed over for either one or two-man operation, are now entirely operated by one man and are working out very satisfactorily.

Douglas Fir Invades the East

Representative of West Coast Lumbermen Explains the Status of the Timber Which Is an Increasingly Close Competitor of Southern Pine—The Vast Resources of the Pacific Coast in This Valuable Wood Are One of Its Greatest Assets

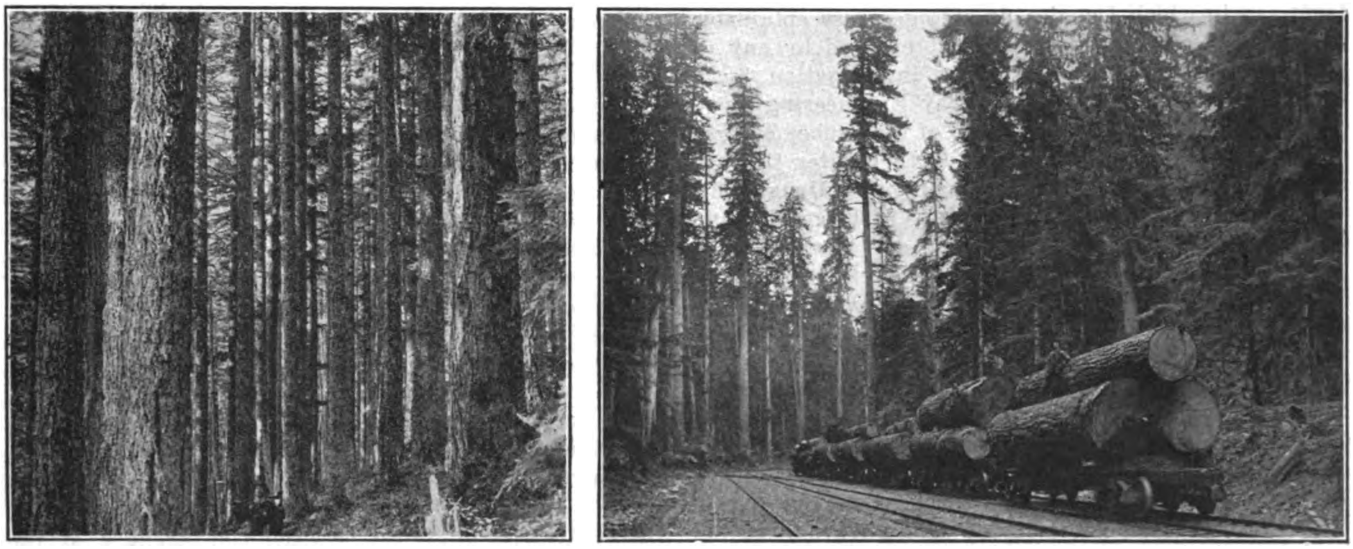
By C. J. Hogue
Manager West Coast Forest Products Bureau, Seattle, Wash.

In VIEW of the increasing interest of electric railway men in Douglas fir as a structural and tie timber, the editors of the *Electric Railway Journal* have asked me to explain its characteristics from the lumberman's standpoint. I am pleased to do this, because I feel that in some parts of the country the position of Douglas fir with respect to other woods available for the same classes of work is not clearly understood.

Douglas fir suffers, as compared with Southern pine in particular, because the different grades are not clearly established and hence because the most suitable grade of fir is not always selected for a given class of work. Southern pine is marketed in the three types: long leaf, short leaf and loblolly, there being fortunately three species of trees which lend themselves well to this grading. Douglas fir trees, on the other hand, while producing grades of timber over as wide a range as those of the three types of pine mentioned, produce simply Douglas fir. As will be explained later, the Western lumbermen are endeavoring to establish grades which will conduce to more intelligent application of this important natural resource.

Douglas fir is suitable for a wide range of uses. It is suitable for 80 to 90 per cent of all the uses to which softwood lumber is put, and with the inclusion of spruce, hemlock and cedar, which are also found on the West Coast, the lumberman in that region can offer materials for satisfactory use in 100 per cent of all the uses for which all the soft woods and most of the softer hard woods are required.

As Dr. Harry C. Brown, wood technologist of the New York State College of Forestry, Syracuse, N. Y., recently put the situation regarding Douglas fir: "This wood is the chief competitor of the Southern yellow pines. The tree reaches much larger dimensions than any Southern pine. Timbers 18 in. square and from 120 to 140 ft. long can be obtained at any time, sizes not to be had from any of the Southern pines. There is no great difference between the strength equivalent of pine and Douglas fir. Small pieces in green or air-dried condition seem to give Southern pine a slight preference, but tests of stringers of structural sizes indicate that Douglas fir is the stronger and stiffer wood when used in these sizes. Douglas fir can be put to the same uses as yellow pine. It makes excellent bridge and trestle timbers. It is largely used in car construction, especially for car sills, for sidings, framing, flooring and roofing, working easier than the Southern pine."



The Douglas Fir in Its Native Habitat, a Characteristic View in the Heart of the Fir Forest

As the writer explained before a meeting of Massachusetts lumbermen recently, the Douglas fir forest region is 100 to 150 miles wide, extending from the shore line of the Pacific Ocean to the crest of the Cascade Mountains, and 500 to 600 miles long from northern California through Oregon and Washington into southern British Columbia. It contains nearly one-third of the standing timber in the United States. That this small area can contain so much timber is due to the density of the timber stand, often as much as 100,000 to 150,000 ft. to the acre being found. The average stand per acre is four times as much as the average for the forests of the country as a whole.

The Douglas fir is the principal species of the region, forming about 70 per cent of the stand, and the Douglas fir alone represents about one-fourth of our remaining standing timber.

The suitability of the wood for various uses is associated largely with its rate of growth. In a large old-growth tree the grain is quite coarse at the center, the rate of growth becoming increasingly slower as the tree becomes older. The fine grainwood of the outer part of the tree is soft, of uniform texture, and it works easily with tools. The wood of medium or normal rate of growth is hard, tough and strong, and is the structural type. The coarse-grained wood of the heart of the tree is suitable for general use for boards, studding, joists and other purposes.

In smaller trees the rate of growth is more uniform, being sometimes of the structural type throughout and sometimes, in fast-growing trees, of the coarser type.

The question is frequently asked as to the difference between red fir and yellow fir. Color seems to be associated mainly with rate of growth. Fast-growing wood is red; slow-growing wood is yellow. Both colors will be found in the big old trees, the coarse-grained wood of the center being red and the color gradually changing to yellow as the grain becomes finer. No difference in strength can be noticed between red fir and yellow fir of otherwise equivalent character.

THE ONLY WOOD AVAILABLE FOR LARGE STRINGERS

Electric railway men are particularly interested in Douglas fir as bridge material and for use in ties. For the former use the large sizes comparatively free from sap in which Douglas fir stringers are obtainable give this species an advantage not enjoyed by any of the competing woods. A recent investigation by a committee of the American Railway Engineering Association showed that over one-third of the timber bridges of the country has stringers of depth greater than 16 in., which means that these stringers were Douglas fir.

The greater demand for stringers of large size and the availability of Douglas fir in all markets have brought it into extensive use for bridge material.

As tie timber, the service records of Douglas fir are based on the experience of Northwestern roads. These roads use a poor grade of fir for ties, both because of the necessity for keeping down the initial cost in their development work and because local ties of low grade can be used economically. Hence the records are not directly comparable with those of long-leaf yellow pine ties used by the railroads of the East, where ties of this latter species were generally of as high grade as the bridge material. It was only during the war that Douglas fir ties of this higher grade material made their appearance and their use is of too recent a date to provide evidence of their worth. The large order of fir ties recently furnished to the Philadelphia Rapid Transit Company consisted of high-grade ties. The results of the use of these ties in Philadelphia will undoubtedly be followed with great interest by electric railway men, particularly those in the East.

In this connection it will be of interest to note that H. S. Betts, of the United States Forest Service, in his book on "Timber; Its Strength, Seasoning and Grading," lists the average life of untreated ties properly tie-plated as follows:

Black locust	20 years or more
Port Orford cedar, Northern white cedar, redwood and cypress	10 to 12 years
Douglas fir, white oak, long-leaf yellow pine and red spruce	6 to 8 years
Hemlock, loblolly pine, birch and maple	3 to 5 years

A recent report by a committee of the American Wood Preservers' Association listed all completed tests, i.e., tests where all ties in the test tracks had been removed, and the results on untreated ties showed an average life of Coast Douglas fir ties varying from 7.3 as a minimum average to 8.4 years as a maximum. Long-leaf yellow pine showed a variation in average life of from 3.5 years to 12.5 years. Of the eleven long-leaf yellow pine tests seven showed an average length of life lower than the Douglas fir average minimum, and this inspite of the fact as noted above, that the Douglas fir was of the low-grade type used until lately by the Western railroads and not of the type directly comparable with long-leaf pine. White oak also showed a variation in averages from 4.5 years to 12.9 years, with two of the six tests showing an average lower than the Douglas fir minimum average.

The United States Forest Service credits treated Douglas fir ties with a life of fifteen years. From the experience of the C. B. & Q. Railroad, with 3,200 Douglas fir ties treated with zinc chloride, of which only 48 per cent have been removed after twenty years, and from the experience of the O. W. R.R. & N. Company with Douglas fir ties treated with creosote oil and laid in a four-mile test track where an average life of sixteen years resulted, it would appear that fifteen years is a conservative estimate. With present track fastenings the mechanical life of the tie is about fifteen years, so that treatment to resist decay for that period is sufficient.

DOUGLAS FIR WILL TAKE PRESERVATIVES

The question is frequently asked as to the extent to which Douglas fir responds to preservative treatment. It must be granted that it is refractive to treatment with creosote and can be injured by too great heat and pressure. Success in treatment results from longer time and lower temperatures and pressures and much use is made of the vacuum in reducing temperatures at which boiling and vaporization takes place.

Western railroads have successfully applied preservative treatment to Douglas fir bridge timbers and piling. In rainy localities creosote has generally been used, while in arid regions both creosote and zinc chloride have been found effective.

In a recent technical note the Forest Products Laboratory of the United States Forest Service stated that there is little difference between the strength of the Southern pines from that of Douglas fir from the Pacific Northwest. True long-leaf pine averages heavier, stronger and tougher than Douglas fir. True short-leaf averages heavier and tougher than the fir, but is about equal to it in the strength as a beam or post. Loblolly pine, although averaging heavier than the fir, is somewhat weaker.

The difference in strength between any of these pines and fir, however, is not so great but that low-density pieces of the one species are weaker than the average of the other species. As far as strength properties are concerned, the choice between any two lots of Southern pine and Douglas fir will depend upon the grade and density of the timber composing each lot. The Rocky Mountain type of Douglas fir averages considerably weaker than the Pacific Coast type.

In a table of working stresses permissible for structural timber, prepared by the Forest Products Laboratory, the following figures are given for three grades of Douglas fir respectively, No. 1 structural, No. 2 structural, and Rocky Mountain region: Allowable bending stress in extreme fiber, for damp locations, 1,100 lb. per sq.in., 900 lb. and 700 lb.; same for use outside not in contact with soil, 1,400, 1,100 and 900; same under shelter in a dry location, 1,600, 1,300 and 1,100; allowable horizontal shear stress in all locations, 100, 90 and 85; allowable compression stress parallel to the grain in short columns, in wet locations, 900, 800 and 700; same in outside location, 1,100, 900 and 800; same in dry location, 1,200, 1,000 and 800; allowable compression stress perpendicular to grain, in wet locations, 225, 200 and 200; same in outside location, 250, 225 and 225; same in inside location, 350, 300 and 275.

The West Coast Lumbermen's Association has issued under date of Jan. 2, 1922, its standard classifications, and grading and dressing rules for Douglas fir and other West Coast timber woods. This gives the characteristics required for all classes of service to which the several woods are applicable. On the subject of Douglas fir ties, the standard classification* says:

Heart ties shall be of sound timber of medium rate of growth to average not less than five annual growth rings per inch; well manufactured. Must be free from decay; wane; heart stain; splits; shake or large knots where the rails lie. Shall not have sap more than 2 in. wide on the top of the tie between 20 in. and 40 in. from the middle.

No. 1 ties shall be sound timber, well manufactured and free from decay; shake; splits; large pitch seams; unsound knots; large knots where the rails lie; wane on corners reducing face width more than 1 in. Very coarse grained pieces to be excluded.

No. 2 ties must be free from rot. Will allow a small amount of fine shake; large knots; sap stain and/or heart stain; pitch pockets; wane on one corner that does not reduce the face width more than 2 in. or the equivalent on two or more corners; variation in sawing ½ in. over or under in thickness, and/or, width or 2 in. over or under in length. Must be suitable for side-track purposes.

Ties for treating purposes shall be of the same quality as foregoing grades except that sap will not be considered a defect.

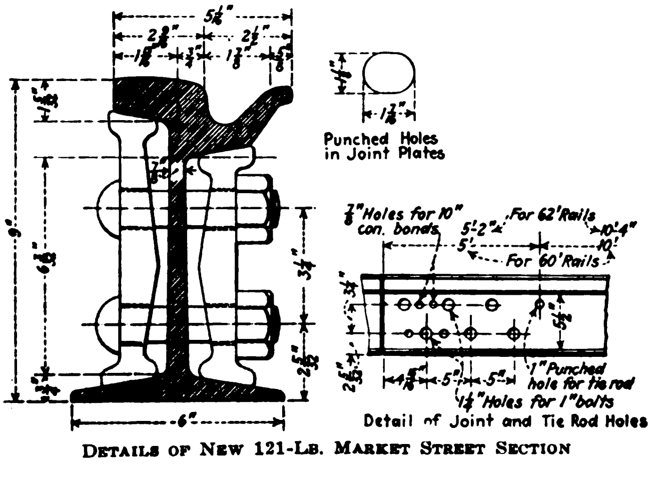
As was suggested earlier, the West Coast Lumbermen are endeavoring to apply modern methods of grading to their product and it is to be hoped that the three grades in the Forest Products Laboratory table quoted above will soon be generally recognized.

---

*The conclusion should not be drawn that, by this classification, the West Coast Lumbermen's Association urges its grading rules in place of the A. R. E. A. grade, which contains a density provision, while the W. C. L. A. best grade contains only a rate-of growth provision. The W. C. L. A. members cut many ties of the A. R. E. A. grade and state their belief that ties on a class 1 road should be of this grade. Their purpose, in offering tie grades, is to suggest grades for smaller roads and minor lines not in position, or when they consider it not necessary, to buy the high grade tie of the A. R. E. A. specification.

A New 121-Lb. "Market Street Rail" for San Francisco

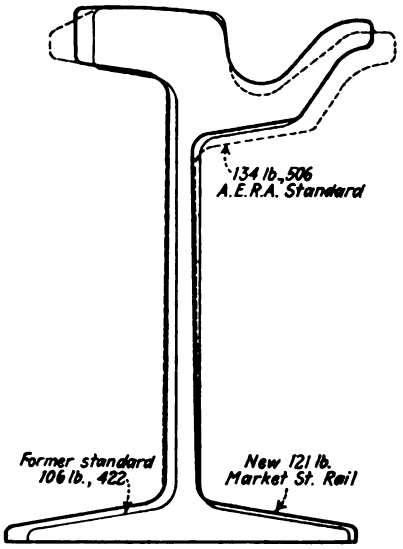
IN PLANNING the renewal of rails on heavily traveled lines of the Market Street Railway, in San Francisco, a modification of the present standard 9-in. girder rail section was found to be economical and an order was placed with the Lorain Steel Company for 1,000 tons of rail rolled to a new section. Delivery in San Francisco is to be made within three months and renewal of rails in Market Street tracks is to be commenced at once beginning at the Ferry terminal.



Detail of Joint and Tie Rod Holes

DETAILS OF NEW 121-LB. MARKET STREET SECTION

The present headway on Market Street is as low as twenty seconds during rush hours; and the cars average 27½ tons weight, empty. The rail which has been standard on this system for several years is the 106-lb. Lorain section. It happens that the rail on Market Street is not this standard, but has a 141-lb. section, and was rolled from low-carbon steel made by the Bessemer process. This rail, which is very soft and has a comparatively short life, now requires to be renewed. To replace it open-hearth steel of higher carbon content is specified. A heavier rail was also thought to be desirable, but the next heavier girder rail, the 134-lb. A. E. R. A. standard, however, was believed to be unnecessarily heavy and involves several features not suited to service on this system. ¶It was therefore decided to design a new section incorporating in it the desirable features of both the 106 and 134-lb. sections. This was done under the direction of B. P. Legare, chief engineer, maintenance of way and structures, Market Street Railway.



COMPARISON OF 106-LB., 121-LB. AND 134-LB. SECTIONS

Chief advantages of the new design are that (1) a rail sufficiently heavier than the 106-lb. section is secured, (2) the same fishplates that were used on the 106-lb. section fit the new rail, (3) the metal in the new rail is enough less than the next heavier standard section (the 134-lb. rail) to effect a saving of about $1,000 per mile of single track.

In the 134-lb. rail the head is wider than required by the wheel tread of the San Francisco equipment, and hence the new head is patterned somewhat after the 106-lb. section but has a slightly wider head and a curved upper surface to conform with the A. E. R. A. section. The taper on the back of the head of the 134-lb. rail is omitted in the new section because the San Francisco practice now is to omit header blocks along the rails and to abut the asphalt surfacing against the rail head itself. This construction makes it preferable to avoid any difference in level between rail head and adjoining pavement that would introduce impact.

The depth of groove and the flange of the new rail are the same as in the 106-lb. section. This was necessary in order that fishplates would be interchangeable between the 106 and the 121-lb. sections, and it is entirely satisfactory because there is no objection to the flange of the 106-lb. section. As an evidence of this it is pointed out that by the time the railhead has worn down to such an extent that the ⅝-in. wheel flange begins to wear the floor of the groove, the rail would require renewal anyway because of wear in the head.

Mr. Twining on Philadelphia Valuation

WILLIAM S. TWINING, director of the Department of City Transit, Philadelphia, has contributed an article to the July issue of the *Manufacturer* on the valuations of the Philadelphia Rapid Transit System as made by the company and the city. He points out that of the ten valuations put on the property, there is a difference between the highest and the lowest of more than $200,000,000. On the basis of the 1921 statistics, with an allowance of 4 per cent on the company's valuation of $290,000,000, the charge per passenger would have to be 6¼ cents, whereas with the lowest figure submitted by the city, i.e., that representing the original cost (new) of the existing property after depreciation had been deducted, a rate of 7 per cent would have been earned with the 5-cent fare. For an 8 per cent return on the company's basis, the payment for the use of the company's property would be equivalent to 3½ cents per revenue passenger, whereas on a 4 per cent basis and the lowest valuation the rate would be only 1 cent per revenue passenger. The actual rental necessary to support the company and its subsidiaries as now existing and financed is approximately 1¾ cents per revenue passenger.

In view of this wide range, Mr. Twining believes that any decision by the commission will be contested by either the company or the city and there is no probability of a final determination in the near future.

B. C. Electric Cautions Automobilists

OWING to the absence of any safety organization of a city-wide nature, most of the safety work in Vancouver, B. C., has had to be done by the British Columbia Electric Railway. While the company has carried this work on for many years, it made a determined effort to eliminate street accidents last December in connection with the change in the rule of the road from left to right. Details of the publicity campaign conducted by the B. C. Electric Railway then were published on page 409 of the *Electric Railway Journal* of March 11.

Briefly, the object of the company then was to awaken the public to a sense of danger when the traffic should change to the opposite direction, to make them visualize crossing the streets, boarding cars, etc., under the changed conditions and generally to make them think. The news interest of the change was sufficient to achieve the first object, and the publicity of the company was then directed to concrete suggestions covering all possible situations.

Thus in one of the numbers of *The Buzzer*, the company's publication in the cars, pictures and diagrams were reproduced showing the new way to do things. In a leaflet sent to all automobile owners in the province, printed by the company and distributed by the government, eight pictures were shown concerning possible accidents. In a booklet issued to 1,600 school teachers, concrete ideas for teaching children the rudiments of safety were set out. Generalities were used only to a minor degree.

That this campaign was successful there is no doubt, for accidents from the usual causes dropped to zero during the first few weeks of the new rule of the road. Had it not been for the fact that cars were without gates for the first few weeks of 1922, thus allowing an increase in step accidents, the record would on the whole have been far below normal.

Since the change, the B. C. Electric has been endeavoring to keep the public up to the same standard of regard for safety. Use has been made of newspapers, car cards and the company's publication in the cars. The local automobile club's safety committee has given recognition to the company's propaganda and is proposing to organize a safety campaign among its members.

The traffic department of the company follows up all publicity with bulletins to the car crews and works in close co-operation in suggesting lines of action. One of these bulletins reads:

> *Safety First*
>
> CURB SIGNALS
>
> May 22, 1922.
>
> Attention is directed to company's advertisements appearing in local newspapers in the interests of Safety First.
>
> Below is an advertisement appearing in this morning's paper, advising people not to leave the curb to board cars earlier than is necessary.
>
> Auto traffic on the streets has taken immense jumps of late, and the danger to pedestrians—unless they exercise extreme caution—has increased accordingly.
>
> The point in connection with this advertisement and advice is that *Motormen must at all times be on the lookout for curb signals from passengers*, as we naturally do not want people to take our advice and then have them passed up.
>
> W. H. DINSMORE,
> Traffic Superintendent.

Automobile Drivers

May we have your co-operation in making Vancouver's streets safe?

In this space for the next few weeks we intend to publish some suggestions whereby accidents may be avoided.

We will be glad to receive suggestions from automobile drivers and pedestrians to further the Safety First Movement in Vancouver.

Let's start today individually to help avoid accidents.

SAFETY FIRST

In the Interests of Safety.
No. 2

Some Safety Suggestions for Automobile Drivers

Please don't pull away from curb in front of street car without a warning.

Please don't try to pass between a moving street car and a standing vehicle or the truss of a bridge.

Please don't cut in sharply in front of a moving street car, such as at intersections.

Please don't follow a street car too closely, as the motorman may have to stop suddenly.

Remember a street car can't dodge.

SAFETY FIRST

In the Interests of Safety.
No. 3

How the Pedestrian May Help

Last week we pointed out the danger of automobiles passing standing street cars.

To the pedestrian we suggest that he do not leave the curb to board the approaching street car earlier than necessary.

In most cases if he signals the street car in plenty of time a second will suffice for him to reach the car gates.

It is not necessary to stand in the middle of the street when the street car is half a block away.

Please be fair with the automobile driver and he will be fair with you.

SAFETY FIRST

In the Interests of Safety.
No. 6

Automobile Drivers, Don't Turn in Front of Street Cars

An automobile and a street car travel alongside of each other. Suddenly the automobile driver puts out his left arm indicating a left turn and shoots across the tracks.

He assumed that the street car was going to stop and thereby risked an accident.

An accident of this kind did occur on Main Street recently; the street car did not stop for the waiting passengers, because it was going to the barns a few blocks away. There was a collision and both car and auto were damaged.

First be sure you're right—then go ahead.

SAFETY FIRST

THE B. C. ELECTRIC COMPANY MADE A DIRECT APPEAL TO THE AUTOMOBILISTS THROUGH NEWSPAPER ADVERTISEMENTS

Electric Railway Publicity

Devoted to How to Tell the Story

Photoplay Projected Publicity Plan of Pacific Electric Railway

AN INNOVATION in projecting its publicity has been undertaken by the Pacific Electric Railway by having Joseph Mattingly, producer, produce and release a two-reel photoplay which exploits the wonders and beauties of Southern California. The story is entitled "The Land of Golden Dreams." Most of the land shown in the picture lies along the Pacific Electric Railway System. In the production of the film the company gave every assistance possible. The film covers all points of interest reached via the Pacific Electric lines from the mountains to the sea. It is produced in natural colors.

The film is 1,961 ft. in length. It is novel and humorous in its projection on the screen. As each scene is projected onto the screen a description of the location is given in the sub-title, then this sub-title is built up with a description of the particular scene or town brought out on the screen. This tends to remove the deadening effect that is apparent in so many scenic publicity films.

The film was released through usual booking exchange on April 24. It has been shown at one of the high-class moving picture theaters in Los Angeles, while thirty prints were immediately released and distributed by one of the largest photoplay distributing corporations in New York for projection on the screen throughout the United States.

Through this most modern of all advertising projects, the medium of the motion picture, the Pacific Electric Lines, in projecting this two-reel comedy-scenic, is heralding to the world the beauties of the picturesque section of Southern California. The picture takes a person back to the year 1780, showing the early days of California's famous old missions. Also, taking one back to those carefree days when kindly California nurtured a romantic race—the old Spanish days of the Dons and their environments. With a short bit of film the camera shows the elapse of time.

Then the story on the film is brought to the year 1922, and scene after scene depicts the principal beach and mountain resorts. Included in the scenes is the trip to Alpine Tavern on Mt. Lowe. All of these places are reached by the company's interurban lines. After the beautiful scenes are shown of the snow-covered Mt. Lowe line of the Pacific Electric to Alpine Tavern, the other extreme is shown in the valleys a mile below where countless orange groves and semi-tropic gardens abound.

The film further carries one among the oil fields, to the country clubs and golf courses, then to the beach resorts, where year-round bathing prevails. In the foot hill and valley towns one is carried through the many beautiful citrus groves, the film closing with a view of a beautiful mountain scene.

The photoplay is in short a message to the world so presented as to entertain, instruct and inspire and likewise to make California better known wherever the film is shown.

"Hello, Jones, C'mon Over Here!"

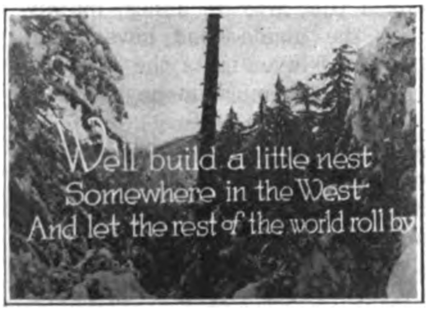
And Jones Is "Coming on Over"—So Are Smith and Brown—So Are the Mesdames Jones, Smith and Brown, Their Close Relations, Friends and Neighbors, Too.

BY W. P. STRANDBORG

Publicity Agent Portland Railway, Light & Power Company,
Portland, Ore.

THERE are many ways of looking at this wonderful, fascinating, inspiring idea of "Customer Ownership" now sweeping the nation fro mborder to border and ocean to ocean. The slants from which you may look at it are as varied and interesting as are the methods used in putting the idea into practical operation. It is, however, not the thought of the writer to engage in a discussion of the general subject, but rather to take a single phase of it, and, now and then, refer to some of the experiences we have had with it within our own company and the numerous communities in which we operate.

Below—The concluding scene or fade-out appearing in the film.
At Right—One of the scenes, photographing the Arroyo and Vista from Mount Rubidoux near the town of Riverside, Cal.



We'll build a little nest
Somewhere in the West
And let the rest of the world roll by

At Left—A view up the Mount Lowe line in winter on the way to Alpine Tavern.
Below—Out where the Heat-Devils play on the desert in Southern California.

SCENES TAKEN FROM THE PHOTOPLAY "THE LAND OF GOLDEN DREAMS"

Of course, the one great, big, dominant proposition involved is that of selling what is, perhaps, the most profoundly important idea the electric railway industry and public utilities as a whole have ever tried or had to offer to the public. Many learned articles have been written about that underlying principle of it all. Much has been written about the subject as a new and wholly practical plan of financing. Others have dwelt on the "Home Industry" phase of it; some have stressed it as a straight out and out and greatly desirable investment proposition; others emphasize the "good will" element, and so on down the line for "Customer Ownership" possesses many sturdy pegs on which you may hang your coat.

The writer likes to think of the whole problem of "Public Relations" as being best visualized in the form of a public street or thoroughfare—the whole urban population for which the utilities provide useful and necessary public service, living on one side of the street, and the electric railways and other utilities living on the other; the main street running from, we shall say, Portland, Ore., to New York, with arterial branches ramifying the entire country and hooking up every community that boasts of public service of any kind.

So, here we have the picture. Jones and Smith and Brown, representing the whole public, live and do business on one side of the street. The electric railways and kindred utilities, light and power, gas, telephones, etc., live and do business across the way. Moreover, until "Customer Ownership" really took hold, there had been—and in many places there now is—"a great gulf fixed" between them.

We, the electric railways, never crossed the street except to collect revenues from Jones, or to raise his rates, usually; though, sometimes, we have lowered them, or else, perhaps, to make some changes in his service so that we would be able to derive greater revenue from them. Jones never knew us save as a bill collector, a great impersonal thing grinding and squeezing the daily pence in the form of car fare or the monthly tribute in the form of service bills.

And, as for Jones, he rarely if ever crossed the street except to pay a bill or kick about the service. We never knew each other in the real sense of neighbors living on the same street, and there never seemed to be any proper channel of introduction that would lead to closer friendship and association.

We had our repair shops, our power stations, our carhouses, our substations, our transmission lines, our whole production and distribution systems over here on our side of the street; we strung lines and installed the lights in Jones's home; we erected our arcs along the street for Jones to pay for; we ran our street cars down the middle of the street for Jones to ride on and pay us car fare for the privilege.

That's as close as we ever got to Jones and as close as Jones ever got to us. Jones sometimes grumbled and kicked because he thought we were making too much money and weren't treating him right, and sometimes we had to go to the trouble of telling Jones he was wrong; that we weren't making a mint full of money; that we were treating him right and so it went along.

POWER, LIGHT AND TRANSPORTATION SERVICE is by its very nature Permanent in Character and continuous and growing in demand.

It is the heart blood of most of our great and flourishing industries, and so long as we have Manufacturing, Timber, Farms, Fruit, Live Stock, Retail Business and Homes, Electric Service will be indispensable to Modern Life. That is why our 7% Prior Preference Stock is the safest kind of a security in which to invest your savings.

Steady Demand Is a Big Asset

Think what it means to have a steady demand for the Public Service rendered by us in a district having a population of more than 330,000 people, day by day, year after year, in nearly 40 different communities, all of them growing and requiring more of this Service as time goes on.

Added to this is the fact that there is $60,000,000 of property back of this security, and this stock is superior in assets and earnings over all of the $22,500,000 fully paid Common and Preferred Stock now outstanding. Also, no stock having preference over this issue will be created without the consent of the holders of a majority of this class of stock.

Investigate this choice opportunity TODAY. You can pay cash or subscribe for this stock on easy terms, purchasable at 96 to yield 7.3% returns.

A GROUP OF ADS TYPICAL OF THOSE THAT MADE A SUCCESS OF THE PORTLAND CAMPAIGN

Light bills and gas bills every month, and car fare every day. It looked like a frightfully one-sided bargain—that is, it looked that way to Jones, mainly so because he wasn't on the inside—had never been across the street to study and investigate the mysterious giants and ogres that took so much money to feed.

Then enters "Customer Ownership."

Now, it can't be said exactly that we were philanthropists, and that, out of sheer love for Jones, we started a new order of things. Nor can we say either that we figured it would be a splendid thing from the standpoint of gaining greater public "good will" that we adopted this new idea. Those elements obtruded, but they did not dominate.

Our own financial difficulties led and hurried us on. We were stagnating. We couldn't keep stride with the progress of our communities. Our physical properties were deteriorating, and we couldn't make enough out of operating earnings to keep them in shape: we couldn't borrow the money in the open market. Yet, we had to do something, and that something was "customer ownership," conceived and developed originally to solve our financial problems.

The other contingent ideas came later; they lent themselves so easily to the new situation that foresighted public utility men were amazed and astounded that they hadn't thought of them before. The ideas in all their economic complexity developed hand in hand until today it would be quite difficult for any man to say that the mere financing feature, or the good-will feature or the investment feature was of itself, the most important and permanently valuable one for the best interests of the community life involved.

So, we, to express it rather provincially, have come out and stood on our own front doorsteps, with broad inviting smiles on our faces, waved our hands across the way and shouted, like genial hosts:

"Hello, Jones, c'mon over here!"

And, as we said at the beginning, Jones and Smith and Brown are all coming over, bringing their friends and neighbors with them.

7 CAN THE CAN 7

AND PUT YOUR MONEY TO WORK

MONEY in a Tin Can or an Old Sock gets you Nothing.

THE WISE MAN makes *HIS* money work for *HIM*, and the more money he puts into *Good Investments* and the harder he makes it work, the less *HE* will have to worry about *old age* and *disability*.

Ask any of our employes about *Our 7 per cent Prior Preference Stock.* It will give your idle money or your savings a good steady job.

ADS THAT EMPHASIZED THE THRIFT APPEAL

Furthermore, Jones, since he has become "one of us," does not stoop down and pick up a brick or rock and shy it at the "damn street car company," when anything goes wrong. No, he tucks his thumbs in the armholes of his vest, swells out his chest and remarks: "That is my company, and if there is anything wrong with it, I guess I'll stroll over across the street and find out what it is."

What a wonderful change in the psychology of the public.

Again, when any outsider starts picking on the company in the hearing of Neighbor Jones, the outsider has got to settle with Jones, the new stockholder in the company, before he has any chance to take his quarrel to the company itself. More psychology.

Now then, the manner in which the different companies have succeeded in bringing Jones across the street and converting him from a rank disbeliever into an inside public utility expert and financier, is another story. It varies greatly with each locality. In the main, the "selling" methods have been strikingly similar.

In a recent able article by E. B. Atchley, of the Northern Ohio Traction & Light Company, in the *Electric Railway Journal*, the general publicity methods employed were graphically and interestingly set forth. Here in Portland, we adopted methods somewhat like those used by the Akron company, but we had different local conditions to meet and we had to meet them in our own way.

Here is one element we had to contend with. We were the third and last local utility to get into the investment field. A competing light and power company had been selling stock ever since July, 1921. The local gas company had been selling quietly for nearly two years, and warmed up into an intensive campaign early in last December. The Portland Railway, Light & Power Company did not start its "customer ownership" campaign till late in January of this year.

It is quite a remarkable coincidence, however, that each of the three local companies has disposed of virtually the same volume of securities. The latest official figures in each case amounting approximately to $600,000.

This is, of course, very gratifying for our company, for we have been in the game only about three months, as this story is being written, and the two other companies had been combing the territory pretty carefully even before we got a good start. We have added a total of 2,500 new shareholders, and have averaged approximately thirty-three sales and eighty shares for each working day of our campaign.

The security which this company is offering is a 7 per cent prior preference stock, per value $100, offered to the public at $96, to yield 7.3 per cent on the investment. It is being sold for cash or on easy payments, $10 a share down and 10 per cent a month, with the partial payments drawing 7 per cent interest till the contract is completed. The dividends are payable quarterly—January, April, July and Oct. 1, each year.

We are the first electric railway in the Far West to attempt the "customer ownership" plan. This is mentioned because it has been somewhat of a handicap in the development of sales arguments in that we have not had an unbroken dividend record like the other utilities have enjoyed, but the sales have gone splendidly in spite of that drawback.

Again, here in Oregon, we have a very rigid "blue sky law," and every scratch of publicity and advertising material produced has had to pass the censorship of the State Corporation Commissioner before it could be used. We have had to be measured by the same unfeeling standard applied to the wildest of wild cat oil or mining stock promotion scheme. But, on the whole, that has been a mighty good thing. It has enabled us to use some powerful selling arguments about "home investment" and "home industry" that we would not have available if the ubiquitous "wild catters" were not eternally scratching at the public door.

There was one factor that contributed considerably to our success. Last year we disposed of $1,000,000 of 8 per cent, five-year gold notes through a sharp, intensive advertising drive, the issue being heavily oversubscribed in twelve working days. We believe this is a record that has not been surpassed by any company in our line of business in the country.

We used employee-salesmen exclusively for the gold notes and we had that organization ready for the campaign when we started selling 7 per cent stock. We had used our best high-power educational and good-will advertising material in last year's campaign, and the influence that is still being felt. We used informative articles in our house organ *Watts Watt* continually for months before we launched our present drive. And, while we started out at a very poor time of the year and when business depression was an element to be considered, we fought all the harder and the results have been eminently satisfactory.

Here are some things the Portland Railway, Light & Power Company capitalized heavily in its advertising.

1. The payment of interest on our 8 per cent gold notes on March 1.

2. The publication of our company's annual statement to the stockholders on March 15. This report showed our company to be in the best physical and financial condition it had been in for years.

3. The payment of our first quarterly dividend on these 7 per cent prior preference shares on April 1.

4. The plans of our company to spend approximately $500,000 this year on betterments, renewals, etc., on our city car lines.

5. The plan to spend a total of close to $2,000,000 on our entire property.

6. The plans for constructing the huge $10,000,000 hydro-electric development on the Upper Clackamas River, which will eventually give us an additional 100,000 hp.

7. The fact that the number of light and power customers of the company is increasing at the rate of about 5,000 a year. The increase in the last year has been more than 5,000.

Special inducements were made to our employees. They were allowed to purchase the stock at 93 for cash and 94 on time. They participate in a series of cash prizes and bonuses distributed each month, and they are allowed to "split" commissions with the high-speed salesmen who close the deal on prospects which the other employees have turned in.

Our selling staff and investment department were organized and developed almost along the same lines as outlined by Mr. Atchley in his article of a few weeks ago. We laid great stress on having our president make frequent addresses to our employees, and on the elaborate and frequent series of "pep" letters issued by the investment department. We issued a series of five little pamphlets containing human-interest "sales helps" and we issued an "Employees' Handbook" that answered every conceivable question that a prospect might ask about the securities or the company.

The whole educational work among the employees in this campaign is, I think, one of the most valuable things we have ever done. Our employees now know more about the ins and outs of our company than they ever did before, and the effect of this is reacting beneficially every day on the public.

In our advertising, we "broadcasted" like a radio station. We overlooked no medium that we felt had any value toward getting our company story over.

We used, so far, a total of sixteen large display newspaper advertisements, starting with a 5 in. x 19 in., then a 5 in. x 18 in., and the other fourteen were all uniform at 4 in. x 12 in. We used our district and suburban newspapers generously. Every issue of our house organ contained something. We covered every car in regular service with dash signs, changing them about every ten days. We used inside "window newspapers." We used attractive posters or cards in our elevators; we used counter and window posters and signs in our general offices, around all of our buildings, changing them frequently.

One very effective piece of publicity was an "industrial educational" film of 2,000 ft., entitled "The Romance of the Raindrop." We filmed everything from the cloud in the sky, the glaciers on the snow-capped peaks, the mountain torrents and so on down, right through the various stages of energy production, transmission, distribution and utilization, with many interesting pictures covering every activity, department, plant feature and equipment of our system.

In this film, we used no advertising material whatever, either in pictorial form or in the titles, and in no place did our company name appear save perhaps on some building or on a street car, but it was easily identified as the pictorial story of our company.

We had no difficulty getting it booked at the leading movie houses in the downtown district, and from there it went to scores of the neighborhood and suburban houses; later we used it in special district campaigns.

We used a great volume of direct mail advertising, for we had available a splendid mailing list of more than 58,000 of our own light and power customers.

It would take too much space to comment on the character of all of the various media and pieces of advertising literature used, but we have given the public, including our own 3,000 employees, our 58,000 light and power customers, our 250,000 daily street car patrons, the most comprehensive, complete, carefully prepared educational campaign conducted in Portland.

Was it worth while? It was. We have discontinued our advertising efforts almost entirely, yet the sale of stock is progressing nicely and the writer is confident that the securities will continue to sell in a satisfactory manner for months to come. If sales do begin to lag, we will "warm it up" again. Our employees are doing splendid teamwork. They have been brought closer together and closer to our company management through this campaign than through anything else we have ever done, and the writer has frequently said that even if the advertising and the educational work which has been conducted in this "customer ownership" campaign had not resulted in sale of a single share of stock, the $15,000 it cost would have been well expended.

Just one or two more little side-lights.

This stock selling campaign has served to stabilize the market of our 8 per cent gold notes sold last year. Before we started selling the stock, some of the gold notes were being "hawked" around at from 80 to 95, but since this new security campaign has been under way, the market has advanced till you can't buy a gold note under par, and I have heard of cases where a premium has been offered.

Essentials of Urban Electric Railway Tracks*

With General as Well as Local Conditions in Mind, the Author Explains Why "Good Enough Is Best" in Track Construction.

By E. J. McIlraith
Formerly Superintendent of Way,
Now Superintendent of Rolling-Stock and Buildings,
Philadelphia Rapid Transit Company.

THE principal purpose of street railway track structure is to transmit the loads due to the passage of cars or vehicles through the rails and ties to the soil in such a way that the unit load on the soil is well within its bearing power, even if the soil is moist.

In steam-railroad practice, rail is chosen of such stiffness that with the usual depth of ballast the load is transmitted to the sub-grade in such distribution that the latter is able to carry it without yielding. The sub-grade is built so as to shed the water that comes through the ballast. As the wheel loads are intense, some flexibility is desirable in the track structure. In street railway practice, however, the same intensity of load is not found. A much stiffer rail is usually used and a monolithic paving must be maintained. The sub-grade conditions are not so nearly perfect because public utilities other than the railways run ditches under the track; broken water mains are apt to develop, and breaks in the paving permit water to run into the sub-grade, where it is confined.

Vertical movement of street-railway rail cannot be permitted, but so long as the structure is able to distribute the load to give a sufficiently low intensity per square foot of area of sub-soil, the simplest and cheapest type of structure should be sufficient. Excessive stiffness or rigidity of structure, that causes the track to act as an anvil to the hammer blows coming from cars and vehicles, is likely to produce a shorter life than would be obtained with less rigid, cheaper construction. It develops a vibration in the rail like that of a piano string. The rigid track is also more expensive to remove when rebuilding becomes necessary.

In street paving of the modern type a concrete slab of sufficient thickness is placed over the soil so as to distribute wheels loads over an area sufficiently wide to reduce the intensity of loading to within the safe carrying power of the soil.

As long as this condition prevails, even when a reasonable amount of moisture is present, street or track paving can be easily maintained and the track will give good service.

BALLASTED TRACK IS USUAL IN PHILADELPHIA

The two general classes into which street railway track structures may be divided are: (1) Track supported on ballast or natural soil; (2) track supported on a solid concrete slab. In Philadelphia and in several other eastern cities the first type prevails.

In Philadelphia, 9-in. 141-lb. girder rail laid on 5-in x 9-in. x 8-ft. ties, spaced 22 in. on centers, is usual. The rail has more than twice the stiffness of the 7-in. 122-lb. American Association section, and therefore spreads the load over a correspondingly greater number of ties. The rail, in fact, is so stiff a girder that with a load of 30,000 lb. placed in the middle of a 72-in. span the deflection will be less than 0.05 in. Each tie has a bearing area on the soil of 6 sq.ft.

We may assume that the cars in Philadelphia weigh loaded approximately 26 tons, each truck carrying 13 tons and having a wheelbase of about 5 ft. Assume that five ties of 22-in. spacing are carrying a load of one truck, there would then be 30 sq.ft. supporting 13 tons. A fairly sandy soil, such as exists in Philadelphia, should carry from four to six tons per square foot. In other words, the safe load for a structure here carrying 13 tons would be approximately 150 tons. It is obvious, therefore, that a safe margin of loading exists and that the installation of a structure more expensive to install, maintain or remove, for the purpose of still further spreading the load would not be economical.

There are soils, however, some of them being found in Philadelphia, where the moisture content is high and where the bearing power at certain seasons of the year may be as low as one ton per square foot. The drainage of this sub-soil is usually cared for as well by the city sewers as if additional drainage was supplied by the railway. The sewer keeps the water level in the soil at a level at least as low as itself, and the water coming in through the paving to the sub-soil is not easily collected in a drain when the soil is of a soft clay type.

A better method of preventing trouble is to provide a layer of porous material between the track structure and the soil. Then the water will not localize, nor will the track structure have the opportunity to puddle the soft soil by vertical movement at points where slight settlement or springiness has developed. The water is contained in a non-puddling material and will spread until absorbed. When a concrete slab under the track is directly in contact with such a soft soil, the hydraulic pressure developed at points where slight settlement of a ditch has occurred carries some of the soft soil from under the slab to the surface of the street. This produces a greater void, causing greater settlement and sluicing action. In fact, considerable difficulty has been found in maintaining concrete-supported track over soft clay soil without a layer of porous material between the slab and the clay. This material may be hard fine cinders, fine gravel, coarse sand or some other material which thoroughly blankets the soil. Coarse crushed rock or its equivalent should not be used.

The same result is obtained if a sufficiently deep layer of porous, but not open, ballast is placed between the bottom of the ties and the top of the clay.

When a crushed rock ballast of say 1-in. or 1½-in. size is used in track construction, it does not serve as well as a much finer ballast would. There is a tendency for soft soil to squeeze up into the voids of the rock, permitting settlement of the track. If, however, a porous material is used, which blankets the soil and gives full surface bearing to the tie, the squeezing of the soil and the accompanying cutting of the tie do not exist. If there is no squeezing up of the soil, then the soil in itself has such bearing power as to support the tie without crushed-rock ballast; the addition of this is a waste of money. Further, if the ties are not being cut by coarse ballast, they are either of expensive hard wood or the loads are light for the size of tie used. Hence economy would result from the use of a softer wood.

In constructing new paving on a street it is important that the track be uniformly supported by uniform tamping or packing of the sub-grade, and also that the soil under the track and the balance of the street be uniformly damp at the time the concrete slab is poured.

It frequently happens, however, that the track strip is concreted before the section between the track and the curb, and after a soaking rain when the top 8 or 10 in. of the soil is thoroughly wet the contractor places the slab between the track and the curb. The result is that the sub-soil under the track has no tendency to shrink, while that under the balance of the street may shrink a half inch or more in depth. This will create a break along the joint next to the track strip.

THERE IS NO ONE BEST TYPE OF PAVING

There is little choice in type of paving for track in busy streets. Granite block is preferable under heavy service. For use under iron-tired vehicle wheels, cement-grout filler is preferable. Brick may be successful in districts where good repressed vitrified brick is available, or where the iron-tired travel is a minimum. Monolithic concrete will have a long life with a stiff track structure under light travel. Sheet asphalt or bitulithic paving, with granite running courses on each side of the rail, has its place also.

With a light rail or light structure, where some vertical movement is likely to develop or where the side stiffness of the rail is not adequate, cement-grout filler or granite block is highly desirable. Where the rail is heavy,

---

*Abstract of paper read at meeting of Engineers Club of Philadelphia. Full text of the paper will appear in the issue of *Engineers and Engineering*, published by the club, for July, 1922.

stiff and well supported, asphalt filler, or better a mixture of good bitumen filler and sand, will serve well, as it is easier to repair or to remove for track repairs. It does not, however, provide a better watershed than the cement-grout filler.

The cushion under block paving should be laid damp, of a cement-sand mixture that will set up hard, to give monolithic support to the monolithic top paving. The use of sand alone is not desirable. Wood block is not a good paving material around street railway tracks.

Paving breaks down more rapidly around special trackwork and at street intersections than along straight track. This is in many cases due to the fact that the hammer blow from cars passing over flangeway intersections is received by a structure rigidly supported on solid concrete. The resultant vibrations produce seams into which the water penetrates, but the most serious cause of breakdown is the contour of the streets. Municipal authorities prefer to have street intersections as flat as possible, resulting in the lodging of water around the tracks. If streets were so graded that water running along straight track would be carried off before it reached street intersections, the paving would have a longer life.

Further, frequently manholes for sewers or water valves, etc., are placed in special trackwork layout. The resultant track construction must be a makeshift. It is highly desirable that municipal authorities co-operate with the railways to remove the present handicap to good construction at intersections.

In Philadelphia, a new type of special trackwork is being introduced, consisting of cast, weldable nickel-chrome steel with flange bearing throughout. This should be more readily maintained than construction in which full flange bearing is not given and where the material is not weldable so that it can be maintained in nearly its original condition. This construction, together with the use of a foundation which deadens vibration yet distributes without puddling the moisture which penetrates to it, should result in longer life. It is important, however, that better drainage conditions should be provided by the municipality here as elsewhere, and that manholes should be located away from track crossings.

Finally, complete sympathy and co-operation must exist between a railway and the municipal authority, if a type of construction is to be used in which the cost is minimum, the conditions satisfactory during the life of the structure and the design suited to the particular conditions to be met. Details in a specification should not be insisted upon merely because a large number of prominent companies or municipalities are using that specification. Standard specifications can be utilized as standards in various localities, but it is important that the right standards for a given set of conditions be chosen.

Benefits of Safety Campaigns*

How the Safety Movement, Originating in 1912, Has Grown to Great Proportions —Results Being Obtained by National Safety Council

BY H. G. WINSOR
Superintendent of Investigation and Adjustments
Tacoma Railway & Power Company, Tacoma, Wash.

THE impelling reason for safety campaigns is the saving of human life, so we may consider that any real effort for saving the lives of our fellow men is worth every ounce of energy, every sacrifice which individually or collectively we can offer as our contribution in such a service.

The best definition which I know of the word "campaign" is this: "A connected series of operations to bring about a desired result." Remember that an intermittent interest, without a definite goal, cannot in any way be interpreted as worthy of the name campaign.

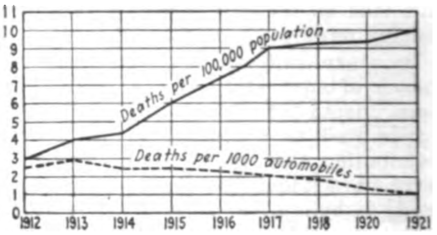
In the industrial field we have a concrete example of a nation wide campaign for safety as planned and carried on year after year by the National Safety Council, and before we consider the much more complex problem of public safety let us review the rapid progress, results obtained and benefits derived from this organized effort in the industrial life of our nation.

While the law of self-preservation had influenced a desultory effort for many years to safeguard the lives of individuals, organized work was initiated by the passage of industrial insurance laws in several states, and the consequent realization by every employer that the double duty of protecting his enterprise in an economic way and his employees from the humanitarian standpoint called for careful consideration, efficient organization and persistent effort.

The first movement for industrial safety, which claimed and received national consideration was launched in September, 1912, by Lew R. Palmer, at that time chairman of the accident prevention committee of the Association of Iron and Steel Electrical Engineers, convened at Milwaukee. A resolution was passed at that meeting which in my judgment should be classed with the most important documents of our time. The resolution was as follows:

> *Resolved*, That the president of the association of Iron and Steel Electrical Engineers be requested to take the first steps toward the formation of a national organization for the promotion of safety to human life in the industries of the United States; this committee to have authority to call future congresses of safety, increase its membership, if it so desires, and to do such other acts as will promote the object for which it is established.

As a result of this action the National Council for Industrial Safety (now called the National Safety Council) was organized and the greatest campaign for accident prevention the world has ever known was formally inaugurated. The movement has grown marvelously during the less than ten years of its existence, having at the present time a membership of nearly 4,000 industrial concerns, including many of the largest in the world.



DEATHS FROM AUTOMOBILE ACCIDENTS IN THE REGISTRATION AREA, 1912-1920

The results obtained by persistent work on the part of the first and succeeding officers of the National Council are well known, and today this organization is regarded as one of the most successful and beneficial which deals with industrial and civic betterment.

With the record of success which has attended the safety campaign in industry, it certainly cannot be unreasonable to assume that while the problem of public safety work is much more difficult on account of the many phases involved, satisfactory progress and results can or should be secured through organization and co-ordination of effort.

If time and space permitted I would like very much to record in detail the published accomplishments of a number of safety campaigns which have been followed with interest, each having much merit both as to mission and result. For the sake of brevity however I can only point out the general scope of each and a few of the excellent results. In doing this permit me to first call your attention to the greatest of all hazards in public safety, the motor vehicle, and to express the belief that regardless of the fact that such vehicles cause a very large percentage of public accidents reliable statistics show a remarkable progress in accident reduction per 1,000 vehicles used as is evidenced by the accompanying chart. We know that most of our serious accidents are due to traffic congestion, that regulation of traffic has and will control this to a great extent and education will also help materially to solve the problem.

The public safety section of the National Safety Council has made rapid progress during the past year in an attempt to promote safety throughout the country. Its campaign is of vast importance. Many other organizations and hundreds of communities are becoming interested in this work which appeals to the heart of everyone. Our one great need is to know just what is the best way to proceed. This is a question which must be answered by experience, with education as the guiding influence.

---

*Abstract of paper presented at the annual meeting of the Pacific Claim Agents' Association, Los Angeles, Cal., June 7-9, 1922.

Program to Be Followed

The promotion of safety through the medium of our schools is generally conceded to be of universal importance. The school boys of today will be the drivers of many motor vehicles within a very few years, and the impressions made upon their minds during their school period is sure to influence their future actions. After the experience of a ten year safety campaign in the public schools of our city I can testify that no more effective work in the interests of accident prevention can be undertaken.

Finally, one of the most beneficial safety campaigns which I know of is the persistent effort followed by this association. Since safety organization was first thought of there has never been a time when interest or effort has waned. Many have said that the problem of accident prevention was almost too great to contemplate and the working out of safety standards and universal safe practices impossible of accomplishment. But while it may take a long time and there may be many disappointments and some failures, the saving of human life is of sufficient importance to assure ultimate success.

Medical Testimony in Litigated Cases*

Where Liability Is Admitted, Medica Testimony Is Often Imperative, but Where Liability Is Denied, Extended Medical Testimony by the Defense Often Confuses the Jury as to the Issues Which Are Involved

By Thomas G. Aston
Claim Agent Washington Water Power Company, Spokane, Wash.

PROBABLY there are as many views on this subject as there are claim agents or as there are cases where this kind of testimony may be used. Nearly every case presents new problems. There are cases where liability is admitted and where the only question involved would be the extent of the injuries of the plaintiff. In this kind of case it is almost imperative that the defendant should use medical testimony.

But this does not always follow, as has been proved by our own experience. We have had cases where we admitted liability, where we have had the privilege of making a physical examination of the plaintiff, and where the physicians and surgeons appearing as witnesses for the plaintiff have been so fair in their testimony that we decided it was best not to use any medical testimony in the defendant's behalf. On the other hand, we have had cases where we have had the privilege of making a physical examination of the plaintiff by physicians and surgeons, where there has been so great a divergence of opinion between those called by the plaintiff and those called by the defendant, that it seemed improbable that two people belonging to the medical fraternity and coming from the same school of surgery and medicine could differ so widely in the opinions as to the actual physical condition of the plaintiff.

Sometimes we question the integrity of the witnesses called by the plaintiff, and sometimes, we regret to say, we question the integrity of the physicians called by ourselves. Of course, we make due allowance for the fact that these witnesses become advocates, more or less, for the side which calls them, but this is an unfortunate circumstance, for physicians and surgeons can do much harm to the side which calls them by too great zeal to make out a strong case for their client.

In cases where liability is denied by the defendant, a different problem presents itself. We have found in this case it is better for the defendant to devote almost all his time and attention to the question of liability and laying as little stress on the injuries as possible.

There was a time when attorneys and litigants in our vicinity thought it of great importance to have an array of prominent physicians and surgeons on the side of the defendant in this class of cases, and this resolved itself into a struggle between the attorneys for the plaintiff and the attorneys for the defendant to enlist the services of prominent and well-known physicians and surgeons on the respective sides. There have been cases where as many as five and six physicians and surgeons were on each side, where the question of liability was very doubtful. The result of this was that it became a contest between the physicians and surgeons, and the court and jury and apparently everybody else lost sight of the question of whether or not there was any liability on the part of the defendant. After listening to days and days of medical testimony the jury have gone to the jury room with nothing in their minds but the question of how badly the plaintiff was injured, and upon arriving in the jury room have immediately begun to figure on how much they should allow the plaintiff, and it does not seem to occur to them that there may be no liability on the part of the defendant. Attorneys for the plaintiff undoubtedly welcomed this situation, and undoubtedly it has often happened that they have created or tried to create just such a situation. It was to their advantage to do so because it carried them over the only real question in the case and assured them of a favorable verdict of some kind.

Until about 1915 this condition existed, and it was a most unusual thing up to that time in the vicinity of Spokane for a jury to return a verdict for the defendant, but the attorneys with whom I have worked and myself conceived the notion that too much attention was given to the medical testimony in this class of cases, to the detriment of the other features of the trial. So we started to experiment, and one of the first cases we had was that of a woman plaintiff who was about seventy-two or seventy-three years of age. She was a genteel, kindly looking old lady, and claimed that she had been thrown from the steps of a street car when she was alighting therefrom. According to our investigation, she was not thrown from the car but had alighted therefrom and had gone almost to the curb of the sidewalk when she fell, and even then the street car had not started. We had about three fair-looking, honest-appearing witnesses who would testify to those facts, but the plaintiff claimed she was injured, claimed a nervous shock and injury to her back and spine and sued for $15,000. We had an examination by one physician and we were fortunate in picking out as this physician a kindly, serious-minded old family physician, who under our instructions treated the plaintiff with the greatest possible dignity and consideration in the examination of her and also in giving testimony about her, with the result that the jury paid little or no attention to the injuries which plaintiff claimed, but devoted their time to the question of whether or not there was any liability, and found for the defendant.

Urge Physicians Not to Become Biased

From then on it has been our policy in respect to medical testimony first to study the plaintiff, considering the character of injuries claimed, age, sex and station in life, and if we are so fortunate as to be able to select our own physician to make the physical examination, we try to pick out a physician or perhaps two for the purpose of giving us the facts of the situation, and also to state them on the witness stand. We try to impress on these physicians and surgeons the importance of not becoming too biased in our behalf, nor too vigorous in their manner of testifying, the whole idea being that we want to show dignified consideration of the claims and physical condition of the plaintiff. For instance, if we have as plaintiff a woman, whether old or young, we try to get a reputable woman physician to make the examination and give testimony, or if a woman physician is not available, to get some well-established family physician. If the plaintiff is an elderly man, we try to get an elderly physician to make the examination. With a younger man we do not pay so much attention to that feature.

---

*Abstract of paper read at the annual meeting of the Pacific Claim Agents' Association, Los Angeles, Cal., June 7, 1922.

Since we began this policy in 1915, the amount of verdicts, where there have been any against us, has been low, and the number of verdicts for the defendant has been exceedingly gratifying. We are led to believe from this experience, that a defendant can have a physician and surgeon as a witness with too big a reputation. Prior to 1915, it was the policy of most defendants in this class of cases to enlist the services of physicians and surgeons who had wide reputations in this community in their particular line of business and were clever in handling themselves upon the witness stand. But this method worked against the defendant many times. The jury would apparently think that these physicians were smarter than those on the other side and resolve all doubts in favor of the plaintiff. In the same way it frequently happens that a lawyer with a big reputation stands little show before a jury when representing a defendant in this class of cases.

I would not have you conclude from the foregoing that the defendant must steer clear of capable, high-class physicians and surgeons in selecting them as witnesses in this class of cases, but the idea I wish to impress upon you is that if you do have one who is high-class he must give his testimony so that it will not go over the heads of the jury; in other words, so that he will not appear to be too smart.

I have said that we sometimes use two physicians, but we do not do that unless there is occasion to use specialists as witnesses. For instance, if a person claims an injury say to the spine, nervous shock and things of that character, and also claims an ear injury or an eye injury, we would try to have an examination by a physician who has some knowledge of nervous disorders and also by another who specialized on the eye or ear, as the case may be. In bone injuries we try to get a physician who specializes in orthopedic surgery. At this point I might state that Spokane and vicinity is extremely fortunate in having a very high-class orthopedic surgeon whose demeanor on the witness stand is unsurpassed by any physician we have ever had the opportunity to observe. His fairness is apparent from the beginning, and it frequently happens that when he is under the employ of the plaintiff in a personal injury case, the defendant is willing to take his testimony as gospel.

SIMULATION MAY DECEIVE

Of course, we all know that even the best physicians will honestly err in making a diagnosis or in forming an opinion as to the extent of injuries a person may sustain. The subject of the examination by the physician or surgeon may simulate the extent of his injuries, and when this is done the physicians of both plaintiff and defendant may be deceived. It is only by some unusual circumstance that this simulation can be discovered. I recall a case where some of the best physicians and surgeons in our community testified on behalf of the plaintiff that he had a complete ankylosis of the shoulder and could not raise his arm from his side. Physicians and surgeons of equal standing testified on behalf of the defendant that the man had a partial ankylosis of the shoulder and that he could raise the arm half way if he tried. During the trial of the case when the plaintiff had been cornered by the attorney for the defendant on cross-examination about some matter relative to the facts surrounding the accident, the plaintiff became quite excited and arose from the witness chair and while in a standing position moved his hand high in the air, trying to explain himself out of the difficulty in which he had gotten himself. The hand which the plaintiff moved was attached to this arm which was supposed to have complete ankylosis of the shoulder. This happened to be a case where the liability was admitted and we were only trying the question of the plaintiff's injury. After this demonstration in court the jury evidently was of the opinion that none of the doctors knew what they were talking about and rendered a verdict for the defendant.

Of course, we realize the difficulty that physicians and surgeons have when handling a case where simulation and malingering enter into it, but it so often happens that there is no apparent evidence of the injury which the plaintiff claims. The physicians and surgeons for the plaintiff can only take the plaintiff's word for the pain and suffering he may be undergoing, and it is only fair to them to rely upon the history of the case as the subject will give it to them. This gives them occasion for testifying that the plaintiff is suffering from these alleged injuries although there are no objective symptoms of these ailments. Of course there is just as much ground for the physicians and surgeons for the defendants in such cases to be of the opinion that the plaintiff is not suffering as he says he is.

Medical testimony may be of benefit in litigated cases where it is purely a question of injury, but in cases where the facts are disputed, medical testimony cannot, from my viewpoint, be of any benefit other than to discredit the testimony of the plaintiff, in other words, for the purpose of getting the thought of the jury that if plaintiff will perjure himself relative to the injury, he cannot be relied upon to tell the truth relative to the facts surrounding the accident. The attorneys can say in their argument to the jury under the court's instruction that if the jury finds that the witness has been untruthful as to any material fact, they have the right to disregard all testimony unless supported by other creditable witnesses. Other than for this reason I cannot see wherein medical testimony can be of assistance in a case where the company relies upon the facts for a verdict. If the doctors get to debating as to the extent of the injury, the jury is apt to find there is some injury even if they do not feel the company is at fault for the injury. If a salesman gets a customer to debating as to which one of two kinds of an article is better, he is almost sure to make a sale, where, if he is endeavoring to sell one article there is a good chance that the customer will decide not to buy. If the same principles are applied to damage suits, success will more often come. In either case "psychology" reigns.

This was brought to my attention most forcibly in a case wherein a man claimed he was thrown off of a street car and suffered an injury. Our doctors diagnosed the case as locomotor ataxia. All medical text books agree that the primary cause of this disease is syphilis. We had four witnesses other than the conductor and motorman, who testified that the man ran after the car after it was in motion and the door was closed and was thrown, so the company was not responsible for the accident. Four doctors were called for the defendant, including a pathologist who testified that the blood test showed syphilis. Five doctors for the plaintiff testified that he did not have locomotor ataxia, that he did not have syphilis, but that it was a paralysis.

In discussing this case with some members of the jury afterwards, I learned that some of them were incensed by our efforts to prove the cause of his injury and that the only question considered in the jury room was whether or not the man had syphilis and the facts about the accident were not touched upon. This case is only one of many where the facts connected with the accident have been clouded and overshadowed by medical testimony.

COURT IN WASHINGTON HAS POWER TO APPOINT A PHYSICIAN

In the courts of the State of Washington the defendant may make application to the court for an order appointing a physician or physicians and surgeons to make a physical examination and to testify as to the physical condition of the plaintiff. This rule does not obtain in the Federal Court, and it is my understanding that it does not obtain in some state courts.

One difficulty about this system is that while it is most desirable to have a physical examination by presumably disinterested physicians and surgeons, it is liable to happen that when you make a motion for an order of court appointing a physician, the court will not take the situation very seriously and will appoint physicians and surgeons the names of whom first come to his mind, and the result of this is that we have foisted upon us some very undesirable witnesses. We find, however, that the attorneys for the plaintiff object to the court making an order appointing a physician because it gives such physicians the character of being officially appointed by the court. The practical result is that in most cases the attorneys for the plaintiff will say to our attorneys that our attorneys may select such physicians as they want. The idea the attorneys for the plaintiff have in this offer is that they can talk to the jury about the physicians and surgeons of the defendant. We have frequently gotten around that in this way. We make the motion for the court to make an order appointing and when the attorney for the plaintiff suggests that we may select our own physician, we suggest that our motion be denied by the court on condition that we may select such physicians and surgeons as we may choose. Then, if there is any comment about these physicians being those of the defendant, objection is made on the grounds that the consent was given by the attorneys for the plaintiff to such selection, and frequently we call attention to the order of the court, denying our motion for the appointment on conditions above stated.

It frequently happens that we will have an examination made of the plaintiff by physicians either appointed by the court or selected by us in the manner described above. We have them all ready to testify but do not call them unless the plaintiff attempts to magnify his injuries. If the plaintiff's doctors make a fair statement of the injury, we feel there is nothing to be gained by presenting additional testimony. It only is liable to give the jury the impression that the injury is the sole question in the case. Further, we run the risk of having our own witness make a statement on cross-examination which will be quite harmful to the defendant's part of the case.

Another question which arises in this class of cases is whether the defendant should use the physicians and surgeons employed regularly by the company. We are inclined to think that it is bad business to call these people, although there are exceptional instances where we feel that it will not injure our case. There is always the danger, under these conditions, of the jury getting the idea that the physician or surgeon is earning his meal ticket and would not dare to give testimony contrary to the notions of the defendant company. In my opinion the testimony of a company physician or surgeon regarding the injury to a plaintiff, unsupported by other medical testimony, is of no more benefit to the defendant than would be the testimony of the motorman about the facts of the case if it be given unsupported by other testimony. The most beneficial use of company physicians and surgeons is to render first aid in case of accident and make examinations at the earliest possible time and keep us advised as to the progress of the injured party. But we have not found them useful as witnesses.

The argument has been advanced that the ideal way of handling the medical end of this class of cases is to have the court appoint a physician or surgeon and fix the fee, giving said person at least a quasi-official character in the case. In many instances this probably would be true, but there is always the chance of some political doctor getting these appointments. Such a doctor might be a very undesirable witness or take insufficient interest in the case to ascertain the true physical condition of the plaintiff. Like many other persons holding an official job, which depends upon politics, the person holding it will not give it the time and attention it really deserves. For that reason I am not in favor of this method of appointing physicians and surgeons in this class of cases.

Summer Meeting of Wisconsin Railway Men

THE railway division of the Wisconsin Utilities Association will hold a two-day meeting at Green Bay on Aug. 17 and 18. Subjects which are to be included in the program are: Maintenance and lubrication of railway bearings; maintenance of brakes and brake rigging; regulation of service and schedules; safety first practices, etc. There will be an inspection trip over the properties of the Wisconsin Public Service Company and a demonstration of tie work and of welding. A banquet and entertainment is being planned for the evening of Aug. 17. Open discussion will be conducted on methods of developing traffic, collection of fares on one-man cars, both city and suburban, and steel ties versus wood ties.

Benefit Association Finances Many Homes

REPORTS showing substantial growth of the organization since its founding two years ago were features of a recent dinner given by the Utilities Mutual Benefit Association, composed of officers and employees of the West Virginia Utilities Company of Morgantown, W. Va. The association was organized two years ago by the company for the purpose of creating a special fund from which employees could finance the building of homes. Enjoyment of the benefits of the association is entirely mutual but is also based to a limited extent upon the term of service of the employees with the company. Employees of the company deposit a certain per cent of their salaries and wages with the association, which sum is duplicated in the form of a bonus from the corporation. From this fund, loans are made for home building to the employees and the earnings from such money are shared mutually by all the stockholders of the association, limited to company employees. The company has no control or authority whatever over the association or any of its resources.

The report made showed the association now had resources of over $5,000, with earnings of approximately 10 per cent since the organization was established. During this period, several homes have been financed.

General Manager Joseph K. Buchanan reviewed briefly the history of the organization and what it had accomplished. He also read a letter from high officials of the company expressing their inability to be present but assuring the association members of the complete co-operation of the company in the plan and purpose of the organization and promising that it would fulfill its part faithfully.

Judge Frank Cox congratulated the employees on the strength of their organization, on the loyalty and faithfulness which had marked their continued connection with the company, and expressed appreciation of their efforts in the biggest public service in the city.

Central Electric Railway Accountants' Association

THE next meeting of the Central Electric Railway Accountants' Association will be held at the Hotel Spaulding, Michigan City, Indiana, on Aug. 25 and 26. The program for Aug. 25 follows:

10:00 a.m.—Meeting of executive committee.
11:00 a.m.—Business session and report of executive committee.
2:00 p.m.—Paper: "Is freight operation of electric railways a paying proposition?" by L. T. Hixson, auditor Terre Haute, Indianapolis & Eastern Traction Company.
7:00 p.m.—Dinner.

American Association News

Engineering Subjects Committee at Work

THE committee on subjects of the American Electric Railway Engineering Association appointed by President Kimball for the year 1922-1923 has been organized. The first step taken by the committee was to obtain from the chairmen of all standing committees in the Engineering Association a complete list of all subjects recommended for further study by next year's committees, together with a list of such new subjects as the chairmen feel should be taken up. Upon receipt of this information the committee will then be in a position to proceed with its work and prepare a list of assignments for the standing committees for the coming year.

The personnel of the committee on subjects is as follows: H. H. Johnson, chairman; R. C. Cram, C. R. Harte, L. C. Datz and H. H. Norris.

Court Reverses Decision

Service-at-Cost Franchise of the Findlay Property Proclaimed Valid—Improvements Now Possible

The Third Ohio District Court of Appeals, which on May 22 last, declared illegal the year-old-service-at-cost franchise of the Toledo-Bowling Green & Southern Traction Company, Findlay, Ohio, recently reversed its own decision. This action was taken by the court, after the city solicitor of Findlay, called the judge's attention to an amended law, which provides that a municipality and a corporation can modify a contract by mutual agreement. After this point had been thoroughly discussed, Attorney George Phelps of Findlay, who started the litigation in 1921, by filing a suit to test the validity of the company's franchise of 1915 after it had been modified in 1921, withdrew from the case.

In filing his suit in the Common Pleas Court at Findlay, Mr. Phelps contended that a municipality could not under the law modify a contract with a corporation. Despite his contention the court ruled against him. Mr. Phelps appealed his case to the Appellate Court which reversed the lower court's decision. The Court of Appeals in handing down its decision was divided in the matter. Judge Philip Crow filed a dissenting opinion in the case.

Under the terms of the modified franchise the traction company is exempt from paying for the paving and maintenance of the street between its tracks.

Had not the Court of Appeals reversed its decision, the company would have been put to an enormous expense this year, as the city of Findlay is contemplating the improvement of a number of its thoroughfares. These improvements were held up pending a final decision on the validity of the modified franchise.

The exemption of the traction company from paying for the paving between its roadways was incorporated in the modified franchise as an incentive for the company to continue operation in Findlay. At the time the 1915 franchise was modified the Findlay operation of the Toledo, Bowling Green & Southern Traction Company was losing $30,000 a year. The modified franchise required the Mayor to recommend to the City Council six reputable citizens, three to be chosen to serve as a rate-making body. This was done and the result was that the fare was increased from 5 to 8 cents. The revenue from this charge was not enough to meet the operating expenses of the company and after three months time the fare was increased to 10 cents, which charge is still in effect. While 10 cents is the cash fare, the company sells seven tickets for 50 cents.

The controversy between Attorney Phelps and the city of Findlay and the Toledo, Bowling Green & Southern Traction Company has extended over a period of almost eighteen months. It has now been ended by the Appellate Court's action.

Railway Asks Time Extension on Reorganization

In a communication sent to the City Council of Pittsburgh by C. K. Robinson, special city counsel of public utilities legislation it is stated that the reorganization of the Pittsburgh (Pa.) Railways will not be completed until about Nov. 1. Under a previous agreement entered into by the city, the railway company and the Philadelphia Company it was planned that the reorganization would be completed by Sept. 1.

Mr. Robinson also sent to the Council a copy of a petition submitted to the Public Service Commission by the railways company, requesting an extension of time. He advises that the city join in the company's request, but adds that the city "should insist that every possible step be taken to accomplish the reorganization at the earliest possible date."

In its petition the company states that considerable time has been consumed in acquiring the outstanding general mortgage bonds of the company. After negotiations conducted with bankers in Pittsburgh, New York, Baltimore and Philadelphia a sufficient number of holders did not accept the offer and negotiations had to be started all over again. The petitioner also states that many meetings have been held, but that it doesn't seem as if any plans could be perfected within the next few weeks because so many persons actively interested in the affairs of the railways company will be away a large part of the time between now and Sept. 1.

The letter refers to the negotiations being conducted with the municipalities and states that many municipalities will still be undecided by Sept. 1.

Under the contract which the commission approved the Pittsburgh Railways and the Philadelphia Company agreed to try to raise $5,000,000 for the purpose of reorganization. The original agreement called for the appointment of an industrial conference board to be named not later than June 1. The date was extended with the approval of the Public Service Commission until Aug. 1 and it is now announced that the industrial conference board will not be named.

Wages Reduced

A Compromise Agreement Retroactive to June 30 Is Accepted by Employees at Cincinnati

The wage controversy between the Cincinnati (Ohio) Traction Company and its employees has been settled. The employees have accepted a compromise proposal on a wage scale that provides a 4 per cent reduction in their wages. The new scale reduces the wage of motormen and conductors from 45 cents an hour to 43 cents during the first three months of service; from 48 to 46 cents an hour during the next three months, and from 50 cents to 48 cents an hour thereafter.

The new terms also provide that if one-man cars are introduced men operating such cars shall receive 5 cents an hour additional compensation. Electric shovel operators will receive 50 cents an hour, car tenders, 32 cents; watchmen, 30 cents; incline gatemen, 35 cents; curve cleaners, 32 cents. The pay of carhouse men also is cut 4 per cent under the agreed schedule. In return for the concession made by the men the traction company is conceding time and a half pay for overtime, instead of straight time pay, as in the contract in force heretofore.

The traction company had asked the men to accept a wage cut of 10 per cent with the expiration of the old contract on June 30. The men refused to consider this and when a deadlock developed each side appointed an arbitrator. These arbitrators were: Attorney Frank Dinsmore for the traction company and Attorney J. H. Vahey of Boston, Mass., for the employees. These two conferred and without selecting a third member decided on the 4 per cent reduction. Both sides had agreed to accept the arbitrators' report. A reduction in the cost of living was taken as a basis for the new terms. The new wage scale will be retroactive and will be operative for one year beginning on June 30.

Accepts Commission's Order

The Brooklyn (N. Y.) Rapid Transit Company will accept the service order recently issued by the New York Transit Commission—the terms of the order will be obeyed on the understanding that substituting fifty new all-steel cars for the sixty-five partially wooden elevated line cars is for the purpose of eliminating this type of car in Centre Street loop and not as an indication of a general policy to retire this kind of equipment. Also that the new steel cars will be financed by funds provided through the retirement of elevated line cars according to contract No. 4.

Night Service Started in Buffalo

Strikers Coming Into Company's Fold—Sympathizers Indulge in Disorder—Union Labor Said to Be Engaged in Organized Attack on Principles Which Govern the Mitten Men and Management Plan

NORMAL day service has been restored on all local lines of the International Railway Company in Buffalo and night cars are being operated over several lines. First day cars leave the barns at 5:30 a.m. and service over all lines is continuous until 9 p.m., when most of the cars are withdrawn. After that hour only a few cars are operated on West Side lines. No attempt has been made by the International up until Wednesday to operate local cars in Niagara Falls or Lockport or interurban cars on any of the western New York divisions.

Since the arrival of about 250 members of the New York state constabulary under Major George F. Chandler in command of the troopers, there have been few signs of disorder although an attempt was made to destroy the Cold Springs carhouse of the company where more than 900 Philadelphia trainmen are being housed. Two bombs were thrown but only a small section of the roof was torn away.

STRIKERS DESERT AMALGAMATED

Herbert G. Tulley, president of the International, feels that the strike has been broken and that little trouble will be experienced by the company in operating cars under the protection of the state troopers. Many of the strikers have withdrawn from the Amalgamated Association and have agreed to support the company. Some of them are now operating cars but the major part of the trainmen being used by the International are from Philadelphia.

The next move on the part of the International will be to prevent the operating of jitney and bus lines within the city of Buffalo. Few passengers are being carried on the cars but the jitney lines are always crowded. The legal department of the International already has announced its intention of applying to the courts for an injunction which would restrain the operation of jitney and bus lines within the city until such time as they secure the necessary certificate of convenience and necessity from the Public Service Commission. The municipal authorities already have granted permits to jitney drivers and have legalized their operation within the city so far as the city ordinances are concerned.

At a meeting of the strikers this resolution was unanimously adopted:

> Whereas, the so-called Mitten plan of operation was thoroughly discussed, and
>
> Whereas, this plan is simply a one-man autocracy that compels men to lose their citizenship rights, and denies them the right of voluntary association with their fellow workers, and the right of collective bargaining and arbitration of industrial disputes, and
>
> Whereas, so-called Mitten plan of cooperation men from the Philadelphia Rapid Transit Company have come to the city of Buffalo to act as strikebreakers and assist in destroying the rights of Buffalo street car men, therefore be it
>
> Resolved, that we unanimously repudiate the so-called Mitten plan of operation on the International Railway Company and do solemnly pledge that we will never operate the cars of the International Railway Company under any such un-American system that denies to men the right of free assemblage and free speech.

The International Railway and the Chamber of Commerce have rejected a proposal of Mayor Frank X. Schwab to appoint a committee to inquire into the causes of the strike so that a public report could be made. It had been proposed that the International appoint three investigators, the Chamber of Commerce, three, the Mayor three and a member of the City Council would also sit as a member. The Mayor says he will go on with the investigation without the help of the Chamber of Commerce or railway company. It is the contention of the Chamber of Commerce that nothing could be gained by conducting a public investigation as the sole reason for the strike is the question of an open or closed shop and that is not a question for arbitration.

It has been informally announced that the Buffalo street railway strike is an open attack on Mr. Mitten personally by the American Federation of Labor in co-operation with interests unfriendly with Mr. Mitten in Philadelphia.

William D. Mahon, the president of the Amalgamated, is fifth vice president of the American Federation of Labor, and it is declared that the Buffalo street railway men will have unlimited support in their fight against Mitten Management, Inc.

The Buffalo *Express*, an independent Republican morning newspaper, has been printing a series of articles tending to discredit members of the state constabulary in Buffalo. Reported attacks on women and children, the driving of horses into stores, etc., have been published with the result that the Buffalo Central Labor Council has adopted a resolution asking Governor Nathan L. Miller to order the withdrawal of the troops from Buffalo. The resolution asks the withdrawal of the troops because "of their many cruelties to the citizens of Buffalo without any justification."

Regarding the criticism of the newspapers against the troopers, Police Chief Burfeind said:

> The troopers are here against my will and have seriously complicated matters, so that it is very difficult for me to quell strike outbreaks. I have taken care of all trouble without violence to the people. The city is not under martial law. If I see an unwarranted assault upon any citizen, or if a trooper commits assault or murder, and a warrant is taken out, the people may rest assured that it will be duly served, as a city officer has a right to arrest a tropper in such cases.

About 900 experienced trainmen from Philadelphia and other cities are being housed by the International Railway, Buffalo, N. Y., in the Cold Springs carhouse of the company. White iron beds have been set up and there is every facility for the entertainment of the loyal employees who are operating cars on the local lines of the company. The men are being paid 75 cents an hour at the rate of time and a half for a 10-hour day and in addition they receive their uniforms and lodging. Moving picture entertainments are held every night and in addition there are card games, dominoes and other games for employees.

Many of the office employees of the company have been living in the general executive offices of the company since the outbreak of the strike July 1. Beds have been placed in many of the offices, shower baths have been installed and meals are provided. All the officers of the company are armed and private detectives from the Henry J. Girvin Agency accompany them in their travels around the city.

All the car houses of the company are under heavy guard and flood lights have been installed on all the company's property. Armed guards also are stationed on the roofs of many of the car houses and a high barbed wire fence has been placed in the rear of the Cold Springs carhouse where the trainmen are housed. Each carhouse has been equipped with a complete first aid kit and physicians and nurses are available at any minute in case of serious trouble.

"Mitten Men and Management" Tells Story

To instruct the public further on the Mitten Co-operative plan, thousands of copies of a forty-eight page booklet, "Mitten Men and Management," were recently distributed in Philadelphia and Buffalo by the Philadelphia (Pa.) Rapid Transit Company. The booklet starts in with an explanation of the Mitten plan and then gives a series of articles from various papers and magazines describing the co-operative idea with some remarks about Mr. Mitten's personality in the scheme. Articles are reprinted from the New York *World*, Brooklyn *Eagle*, *The Outlook*, *Trade Winds*, *World's Work*, *Progressive Labor World* and *Printers Ink*. In the last mentioned magazine the writer sums up the Mitten story by saying "It looks as though Thomas E. Mitten and his 10,000 men were writing what might be called a new Co-operative Declaration of Independence in the realm of industrial relations."

Seeks Injunction

Dayton City Railway Charges County Tax Commission With Illegal Action —Opposed to Tax Assessments

The City Railway, Dayton, Ohio, has applied to the United States District Court of the Southern District of Ohio for an injunction to prevent the treasurer of Montgomery County from collecting a tax levied in the year 1920. The plaintiff in its bill of complaint charges that the tax commission in making the assessment did not proceed upon any proper principle of valuation and adopted an improper mode of fixing the value of the railway property in that it did not apply the same rules and principles in estimating its valuation as were adopted and used with respect to other property in the state and county.

It is further charged by the railway that for many years past there has been in the county a systematic general under-valuation of real estate for purposes of taxation, the average tax valuation not exceeding 60 per cent of its true value; that no re-appraisement of real estate in the county has been made since 1910; that as a result of such failure to adopt and follow a uniform rule in assessing the City Railway's property the tax rate in 1920 is much higher than would have been required to produce the same revenue had the real estate been assessed on the average as its true money value. The company further alleges that if the treasurer is permitted to seize the railway property and enforce the collection of the tax, its operation as a public utility will be hampered to its irreparable damage, the embarrassment of the public, and without any remedy at law.

The City Railway prior to March 1, 1920, filed with the tax commission its annual report. The commission fixed a tentative value of $2,970,220, but later reduced it to $2,938,850. A subsequent rehearing was had, and a further reduction in assessable value was refused. The county auditor charged against the city railway's personal property taxes to the amount of $74,521 and on its real estate not used in the daily operation of its business $388. In the following December the railway paid $37,454 as the first semi-annual installment of the tax charged against it.

The defendant in the matter says that the railway did not in the County Court of Common Pleas institute proceedings to reverse the action of the tax commission, but paid the first half of the tax charged and sought no remedy until the other half became due, at which time the proper municipal and school authorities of the city of Dayton and the county of Montgomery had contracted large obligations on the faith of the tax duplicate. Also that the railway had an adequate remedy in the due course of law which it failed to pursue.

Judge Sater, who presided at the preliminary hearing, determined all the legal questions involved in the issue. The matter has been referred to a master to take testimony. This hearing will commence on Aug. 28.

Recently the railway filed suit in the United States District Court at Cincinnati against the Montgomery County treasurer and the Ohio State Tax Commission to restrain the collection of $43,590 in taxes for the last half of 1921. The company contends that it is being assessed on a 100 per cent valuation fixed by the Ohio State Tax Commission, although owners of property in the counties are paying on a 60 to 70 per cent valuation. Judge John Weld Peck set the case for hearing on Aug. 7.

Two Branches for National Transportation Institute

Formal organization of the National Transportation Institute will be effected before Sept. 1, it is believed. The organization is to be divided into two branches. The educational branch will be conducted under the immediate direction of a board of governors, of which Edgar E. Clark, former member of the Interstate Commerce Commission, will be chairman. The business side of the organization will be conducted by a board of directors. Its personnel has not been selected, as yet. It will be made up of representatives of the different interests concerned with transportation. Representative Sidney Anderson, of Minnesota, under whose direction the agricultural inquiry was made, has accepted the appointment of vice-chairman of the board of governors.

Wants Issue Put to Voters

Since the City Council of San Diego has denied the San Diego (Cal.) Electric Railway's application for a franchise to construct and operate a line on Sixteenth Street, between Broadway and Market Street, the traction company will carry its fight to the people of the city, it has been announced. An initiative ordinance granting the Sixteenth Street franchise is being circulated, and upon the securing of sufficient names, as required by the charter, the proposed law will be submitted to a vote at a special election. Citizens will be asked to bring about the abolition of charges against the corporation for paving between the car tracks where new work is ordered by the City Council.

The matter of relief from paving costs also is contained in another initiative petition to be circulated. This proposition must be an amendment to the charter. The railway company is willing to submit such an amendment to the people in order to get an expression regarding relief from the burden of paving costs that hereinafter might be imposed by new street improvements.

No local issue in San Diego in several years has aroused the interest that attaches to the railway company's efforts to extend its lines over Sixteenth Street. The company contends this link is necessary in its progrgam of giving San Diego a superior street car service, while the City Council, by a vote of 4 to 1, decided the extension was not warranted at this time. The Council has been petitioned by the business interests to reopen the hearings, but declined. The company's decision to put the question to the people followed.

Will Spend $5,000,000 on Improvements

Fifty-three public utility companies in Indiana will spend about $5,000,000 between now and the end of the year on new equipment and plant extensions, according to Charles L. Henry, president of the Indiana Public Utility Association. This was disclosed in replies to questionnaires submitted only to members of the state association. Only seven of the companies questioned replied that they planned no such work.

The Indianapolis & Cincinnati Traction, of which Mr. Henry is president, is preparing to extend its line from Rushville to Cincinnati, a project mentioned previously in the *Journal*, but this work is not included in the estimate of the company's expenditures for the next six months. Indianapolis public utilities will spend approximately $2,280,000 on extensions and new equipment in the next six months, the association's figures show.

Companies operating in more than one city will be active and their estimates also are large. The Interstate Public Service Company, Harry Reid president, will expend about $500,000 and the Indiana Service Corporation, Fort Wayne, Sam W. Greenland president, reported, has some $300,000 worth of work that must be done before the end of the year. Work already is getting under way for a new $500,000 artificial gas plant at Kokomo, Ind.

Philadelphia Wage Base Cities Changed

In connection with the wage issue at Buffalo, N. Y., the following statement was issued on July 18 from the office of the Philadelphia (Pa.) Rapid Transit Company.

> At a meeting of the General Committees for collective bargaining under P. R. T. Co-operative Plan, held this day, it was agreed by the representatives of Men and Management in view of the unsettled conditions existing at Chicago and Buffalo, two of the cities upon which P. R. T. wages are based, that the wages now paid here shall remain undisturbed until after the 1923 wage adjustments are made effective at Cleveland, Detroit or Chicago; it being agreed that Buffalo, under Mitten Management, should be no longer included as a basis for determining wages at Philadelphia.
>
> President Tulley's statement describing the introduction of the Co-operative Plan at Buffalo, and the use of the volunteer P. R. T. employees now on vacation, to temporarily operate Buffalo cars, in order to hold open runs for the old Buffalo employees desiring to return, met with warm approval; and his description of this method of winning over the striking employees by the missionary work of the P. R. T. men on Buffalo cars established an added feeling of confidence and a greater appreciation of what the Mitten Co-operative Plan can be expected to accomplish under the most adverse circumstances.

600,000 Passengers Discommoded by Power Failure

Interrupted Power Supply Stalls Brooklyn Subway, Elevated Trains and Surface Cars at Height of Rush-Hour Period—Passengers Discharged Safely from Stalled Trains and Cars

THE various emergency devices provided for the safety of passengers in New York City's subway system were given a severe test last Tuesday evening and everything worked as intended. The entire transportation system in Brooklyn, consisting of subways, elevated and surface lines, was completely tied up due to a blow-out in a high-tension compartment of the main switchboard in the Williamsburg power house. This is the main generating station of the entire Brooklyn system and feeds power to twenty-six substations in Brooklyn and Queens. The blow-out occurred at 5:15 p.m. Tuesday, and it was nearly an hour before any of the stalled cars were able to move. Officials of the railway estimated that fully 600,000 passengers were homeward bound at the time.

The immediate cause of the trouble was a short circuit in a 66,000-volt three-phase oil switch connecting a 10,000-kw. generator to the switchboard busbars. A serious fire resulted which spread to the construction work on the switch cells. It was necessary to use water to suppress the flames as the insulation of the overhead cables took fire and intense heat was generated by the oil flames. The trouble occurred on the fourth floor of the power house and the water penetrated to the floors below. This necessitated a complete shut-down of the 180,000-kw. station, which was supplying 100,000 kw. at the time. No damage was sustained by the generator connected to the oil switch.

When power was shut off there were five trains in the Brooklyn bound tunnel under the East River, which connects the stations of Whitehall Street in New York with Court Street in Brooklyn. There were no trains in the New York bound tunnel. This tunnel is equipped with spacing signals and the various trains were forced to come to an immediate stop through the action of automatic trips which went into operation through the discontinuance of the power supply. The current for operating trains through the tunnel is regularly supplied from two sources. Power for the Brooklyn end comes from the Williamsburg power house, which supply was cut off, while the power for the Manhattan end of the tunnel is supplied by the Interborough Rapid Transit Company's power house. There were two trains in the New York end of the tunnel, from which power was not shut off.

As soon as it was evident that the power supply would be interrupted for a considerable period, employees of the transportation department walked through the tunnels from the Brooklyn end and explained to the motormen, guards and passengers the cause for the delay and reassured them that exits from the tunnel could be immediately obtained by walking along the duct bench to the nearest exit. The first train at the Brooklyn end of the tunnel was stalled with its head car only a short distance from the Court Street station platform. The various doors in the train were immediately opened and passengers walked on the concrete duct bench to this station, where emergency tickets for additional rides on the Brooklyn Rapid Transit system were issued.

An emergency exit from the tunnel is provided at Furman Street on the Brooklyn side, and the passengers from the second and third stalled trains on the Brooklyn side walked to this emergency exit and so to the surface. The two trains that were in the Manhattan end of the tube were backed up to the Whitehall Street station.

At other points in the subway where the power supply was interrupted motormen were enabled to coast with their trains for a considerable distance, as these sections were not equipped with safety signals and automatic stops. In many cases the trains coasted to the next station and discharged their passengers. Where trains were stalled before reaching the station, the motormen immediately communicated with the dispatcher's office through emergency telephones which are located at convenient intervals in the tunnel. They were thus advised immediately as to the cause for the interruptions and were given instructions for bringing passengers to the nearest exit point.

In addition to the emergency telephones which proved a great convenience, the emergency lighting circuits throughout the tunnel and in the cars worked entirely satisfactorily. The cars have emergency lights which are operated from a storage battery and are automatically turned on as soon as the power supply fails. The tunnel lighting is supplied from sources separate from the third rail, and the supply for the Montague Street tunnel was from the New York Edison Company, which was not interfered with. The emergency lights are also automatically turned on in the tunnel whenever the regular power supply fails.

Some of the stalled trains were of the new type, where a single operator controls the doors for three cars. In these trains the guard opened the doors at the ends of the cars so as to provide a passage and he then assured passengers in the other parts of the train that there was no danger and that full information would be given them as soon as it was obtained.

The same method of taking care of passengers on the various elevated lines was used as that for the subway. Motormen coasted with their trains as close to stations as possible and then communicated with the dispatchers by telephone. As soon as they received their instructions, assistance was given passengers so that they could alight from the trains and walk to the nearest station.

An emergency power supply was obtained from the New York Edison power house as soon as possible, and the cars and trains were moved slowly toward their terminals. For a time no additional passengers were accepted but regular service was again resumed after approximately an hour's interruption.

Despite the magnitude of the tie-up and the protracted period over which traffic was suspended, there was no excessive anxiety or panic reported at any point and there was not a single accident on the transportation system.

Fire Extinguishers Not the Cause of Poisonous Fumes

In a report to the New York Transit Commission in regard to the fire in the Interborough subway as given in these columns in the issue for July 8, Gen. Lincoln C. Andrews, chief executive officers of the Transit Commission, recommended the continuance of the use of Pyrene fire extinguishers for this service. The report states that there is no evidence that poisonous gas was generated through the application of carbon tetrachloride. The smoke and fumes generated by the fire were principally from burning insulation, copper, paint and other substances. A thorough search was made for a suitable substitute for carbon tetrachloride as a fire extinguisher in similar circumstances, but this as yet has disclosed none as good or better.

The Underwriters' Laboratories in New York, which are established and maintained by the National Board of Fire Underwriters, has made public a statement by Dana Pierce, vice-president. In this statement Mr. Pierce said that an extinguisher of the Pyrene type is the only one known which does not involve serious hazard of electrical shock to the operator who might attempt to use this on an electrical fire in a steel car, and that the use of sand and shovels to put out fires in railroad cars is impracticable.

Gen. Andrews' report recommends that the Transit Commission direct the Interborough Rapid Transit Company to resume the use of the tetrachloride fire extinguishers for use in case of short circuit fires.

Chicago Matter Unsettled

Men and Management Still Dickering—Surface Company Has Bettered Its Wage Offer

The strike on surface and elevated lines in Chicago still threatens. President Henry A. Blair of the Surface Lines took a positive stand for a maximum 65-cent wage and a nine-hour day on July 24 at a conference attended by International President Mahon and local officials of the street car men's union. Arrangements were then made for a similar conference to be held with President Budd of the Elevated Roads.

President Mahon announced that the question of a strike depended on the solution of four points:

1. The proposed wage cut.
2. The extension of the eight-hour day to nine hours.
3. The thirty-day clause in the proposed new contract.
4. The sale of tickets by conductors.

Tickets have been sold on the cars at the rate of three for 20 cents, since June 15, by order of the United States District Court. While the percentage of ticket passengers is more than 40 per cent the conductors have complained bitterly about this added duty. It was explained to the union chiefs that the company would willingly abandon the use of tickets, but this was a condition fixed by the Federal Court when the 6-cent order of the Illinois Commerce Commission was enjoined. It was hinted that the union men would appeal to the commission and the court to have the rate of fare fixed at 7 cents without tickets, or to have tickets sold by outside agencies and not by the conductors on the cars.

The "30-day" clause objected to by the men is one which President Blair said would be necessary. In short, the management is unwilling to tie itself up with a long-term contract with its employees when its revenue might be seriously affected by another order of the commission.

Following the conference with the Surface Lines' management, President Mahon gave out a statement, in which he said:

> We tried to the best of our ability to point out to them the unfairness of their position in wanting to reduce the wages of our members and take from them their eight-hour day, but after all our arguments we could not change them. They still stand on their original proposition. We brought the conference to a close with the understanding that if we desired they would meet us again.
>
> We have asked Mr. Budd to meet us in conference either tomorrow morning or afternoon for the purpose of taking up the same proposition, namely, that of wages and hours for the elevated employees, and we will leave matters rest in abeyance as far as the surface lines are concerned until after our conference with Mr. Budd.
>
> This is purely a wage dispute. The companies have been making money. They have been required by the court to make a reduction temporarily until the court can investigate and determine what the rate of fares shall be, but they would not wait until the court acted.

The final proposition of the Surface Lines was contained in a letter written to the union officials by President Blair on July 18. This raised the offer from 60 cents to 65 cents, instead of the present 80-cent maximum rate per hour. It also provided that working conditions would remain unchanged, except that the present bonus provision for paying time and one-half after eight hours would not apply until after nine hours. Mr. Blair stated:

> This reduction in fares has reduced our receipts by about $8,000,000 a year, and the continuance of our present wage scales would make it impossible for the companies even to meet our obligations. The wage scales offered will reduce the net earnings of the companies to a point below which they cannot fall unless their ability to serve the public is materially impaired.
>
> In offering a wage scale of 65 cents an hour for trainmen, we did so knowing that such a scale was as high or higher than like wage scales paid in other large cities of this country.
>
> The working conditions in effect on the Surface Lines are, as regards time allowance, more liberal than those of most cities. It was with this in mind that we have requested a change in the bonus time allowance after 8 hours in our present contract.

He also renewed his offer of arbitration in the event that an agreement could not be reached, and said the present offer is not to be used in arbitration if it is not accepted.

The union and the company recently rejected the offer of assistance made by the State Board of Arbitration. After President Mahon arrived in Chicago, he issued a statement in which he said he would be glad to have the help of anyone who could prevent trouble.

Following the meeting on July 25 between the employees' committee and the officials of the Chicago Elevated Lines negotiations will be continued in an attempt to settle wages and working conditions. At the same time the committee representing the employees of the Surface Lines has asked for another conference with Henry A. Blair, president of the Surface Lines. The possibility of the strike has been postponed for at least several days with the announcement of W. D. Mahon, president Amalgamated Association, that Mr. Blair's 65-cent wage offer and any other offer which may be made by Britton I. Budd of the Elevated governing committee would both have to be submitted to a referendum before a strike could be ordered.

Plans for Extension Halted

The decision of the Ohio Supreme Court recently in the Cincinnati (Ohio) Water Works funds case has placed an obstacle in the way of the proposed extension of the Cincinnati, Lawrenceburg Aurora Electric Street Railroad from Anderson's Ferry to the Dixie Terminal, Cincinnati, a distance of approximately 6 miles. In ruling that the city of Cincinnati had no legal authority to transfer water works revenues to any other department the court held that the city's home rule charter had enacted as part of the city all State laws in existence at the time that the charter was adopted. One of the statutes then in force was the Schmidlapp law, which provided that the city could not make a new grant to a utility company unless the rate of fare is fixed not to exceed 5 cents. S. Shaffer, secretary of the company, said:

> We have legal opinions that such is the effect of the Ohio Supreme Court decision. That is a serious obstacle in our path. We were ready to proceed with the extension when this was put in our way; we had the project practically financed and all our plans completed ready to submit to City Council, but we cannot go about it if we are limited at the outset to a 5-cent fare.

Mr. Shaffer recently appeared before the Council committee on street railways to urge the passage of an ordinance which would continue for two more years the 7-cent fare now in force on the Cincinnati, Lawrenceburg & Aurora from Anderson's Ferry to the western limits of Fernbank (Ohio). He stated that the interurban company had barely come out even under this rate of fare during the past year. The matter has been taken under advisement.

News Notes

Employees Sign Agreement.—An agreement has been reached between the Interborough Rapid Transit Company, New York, N. Y., and its employees whereby the present agreement both as to wages and working conditions will continue in force for another year. The expiration date will be June 30, 1923.

Employees Make Record for Home-Buying.—Since Jan. 1, 1922 the employees Mutual Savings, Building and Loan Association of the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has made mortgage loans to 175 members for the purpose of buying homes. The total of the loans exceeds $400,000. Since the eight years of the association up to June 1 last, a total of $3,747,241 has been given out in loans to 1,500 members.

Cut Withdrawn.—Employees of the Hamburg Railway, Buffalo, N. Y., an interurban line operating between the Buffalo city line and Hamburg, went on strike on June 30 in protest against a wage cut of 2½ cents an hour in the maximum pay. After a conference between the men and the company, the wage cut was withdrawn and the men returned to work. The strike continued less than twenty-four hours. The wage scale is 40 cents an hour for the first three months; 45 cents for the next nine months, 50 cents an hour thereafter and recognition of the union.

Riders Pay for Paving.—More than $1,000,000 every year is being contributed by the riders on the lines of the Public Service Railway, Newark, N. J., towards the cost of paving streets. "*Whys and Other Whys*," published by the railway, puts it another way—every year, the cost of furnishing electric railway service, which is paid by the car rider, is increased by $1,000,000 to furnish paving, which the cars do not wear out and which in no way adds to the comfort and convenience of the rider. The company has already paid for pavement more than $7,100,000.

Financial and Corporate

Indianapolis Properties Report

Decreased Revenue in 1921—Bus, Jitney and Business Depression Important Factors

The annual meetings of the stockholders of the Indianapolis (Ind.) Street Railway and the Terre Haute, Indianapolis & Eastern Traction Company were held recently, with the officers and directors of both companies being reelected. According to the reports submitted both companies showed a falling off in revenues, though the Terre Haute, Indianapolis & Eastern property finished the year 1921 with a balance of $92,187. A deficit of $242,137 was the 1921 result for the Indianapolis Street Railway. Neither railway paid dividends in 1921. In commenting on their financial condition both companies referred to the general business depression and emphasized the serious loss of revenues resulting from jitney and motor bus competition. The need of higher fare and more equipment was stressed in outlining the necessities of the Indianapolis Street Railway.

A comparison of the Indianapolis Street Railway operation in 1921 and 1920 with respect to gross earnings, maintenance, taxes, etc., follows:

	1921	1920
Passenger receipts—City lines	$4,387,087	$4,801,130
Transfer receipts—City lines	307,724	7,398
Miscellaneous earnings—Track rentals, etc	538,515	559,406
Gross earnings	$5,233,327	$5,367,936
Maintenance of ways and structures	548,878	501,235
Maintenance of equipment	550,120	626,031
Operation of power plant	877,212	958,225
Operation of cars	1,565,814	1,564,501
General expenses	420,417	417,889
Total operation expenses	$3,962,443	$4,067,883
Net earnings	$1,270,883	$1,300,053
Less taxes	437,952	509,471
Net earnings, less taxes	$832,930	$790,582

From the net earnings of $832,930 deductions of $645,068 were subtracted, leaving a surplus of $187,863, from which deductions of $430,000 were made, leaving a deficit of $242,137.

The statement of earnings of the Terre Haute, Indianapolis & Eastern Traction Company for 1921 follows:

	1921
Gross earnings from operation	$5,130,124
Operating expenses	3,734,957
Net earnings	$1,395,166
Taxes	333,819
Earnings from operation, less operating expenses and taxes	$1,061,346
Other income	
Rental of Kentucky Avenue freight terminal	$12,499
Dividends on stocks owned	139,800
Interest, etc	24,353
Sales of power, West Tenth Street power plant	119,550
	$296,204
Earnings from all sources, less operating expenses and taxes	$1,357,551

After deductions and rentals totaling $1,056,033 a surplus remained of $301,518. From this sum $209,331 was subtracted as a sinking fund amount. A balance remained of $92,187.

Railway & Power Companies Have Bond Issues Approved

The Tennessee Railroad & Public Utilities Commission has authorized the Nashville Railway & Light Company to issue bonds in the sum of $1,000,000 to cover expenditures and improvements which have been made upon the property since the commission's last valuation.

The Tennessee Electric Power Company also was allowed to issue approximately $16,900,000 in bonds which will replace bonds in its constituent companies, the Chattanooga Railway & Light Company, the Chattanooga & Tennessee River Power Company and the Tennessee Power Company. The bond issue by the Tennessee Electric Power Company will replace bonds of more than $20,000,000 issued by the constituent companies and will thereby reduce the indebtedness of the Tennessee Electric Power Company by nearly $4,000,000.

Estimate for 1923 Offers $14,000 Reduction

Superintendent George F. Russell, of the Department of Public Utilities, Seattle, which department operates the Municipal Street Railway System, recently submitted to the City Council a budget estimate for 1923 which, he asserts, offers a $14,000 reduction from the allowance of 1922. Interest has been increased in the estimates because of the effort to cut expenses in order to obtain a 5-cent fare. The grand total of 1923 expenditures asked for is $6,866,102 compared with $6,879,357 according to the budget estimate.

The reduction would be much larger were it not for $624,460, estimated cost of track replacements and removals proposed for the railway during the next year, Superintendent Russell states. Mr. Russell claims that this outlay of expense is necessary, saying "there is danger of collapse of the whole railway system unless it is properly maintained."

The decrease in the salaries of the transportation department is $503,160, in the equipment division $2,870 and in the accounting division $11,980. A decrease of $23,350 is shown in the fixed charges. These include interest and redemption of bonds.

Gross revenues of the city of Seattle for 1923, from sources other than taxes, have been estimated by City Comptroller Harry W. Carroll at more than $12,000,000. This figure includes $3,000,000 for the light department, $1,250,000 for the water department and $6,500,000 for the street railway department, contingent on the maintenance of the 8½-cent fare. The comptroller also figured for the City Council the sums necessary to be levied in 1923 for interest and redemption on general bonds. The interest item is $807,254 and the redemption $217,500.

Line To Be Sold.—The holdings of the North Alabama Traction Company, Albany, Ala., including real estate and franchises, will be offered for sale to the highest bidder on August 11 by A. A. Hardage, special master, under orders of the United States District Court.

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over, except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen and conductors on street and interurban railways in the United States. †Revised weighting.

Municipal Officials Pleased at Detroit Showing

Detroit Street Railways Realize Net Income of $227,422 for Forty-Seven Days' Operation—Service Improved, Says Mayer

THE first financial statement giving conditions of the Detroit Municipal Street Railway System since the Department of Street Railways took over the Detroit United lines on May 15 shows that a surplus of $508,850 remained after all legitimate charges and charter requirements have been met, including interest and sinking fund charges. Of this amount $227,422 has been accumulated since May 15. The detailed report shows that a surplus was added to even during the month of June, when rehabilitation of the old Detroit United Railway lines was fully under way. The beginning of operations of the Department of Street Railways was taken as Feb. 1, 1921, shortly after the first municipally-built line was opened.

Total deductions	$342,565	$180,512	$523,077
Net income	$98,744	$128,678	$227,422

In a statement made public by Mayor Couzens it is pointed out that the net income for the month of June was $98,744, remaining after providing for the pro rata amount of interest and sinking fund on the $13,050,000 public utility bonds outstanding; interest on the loan of $4,120,000 at the bank rate of 3¾ per cent., interest on the deferred purchase plan of the Detroit United Railway; provision for the $500,000 payment due the Detroit United Railway, Dec. 1, 1922, and provision for the payment of the final balance of $7.580,000 due in 1931.

The Mayor further stated that the revenue accruing through the rental of tracks to the Detroit United Railway for its interurban service is estimated for the reason that no agreement has been reached with the company. The rates paid in the city of Toledo, namely, 36 cents per mile for motor cars and 24 cents for trailers, have been used as an example in computing this earning.

No agreement with the company has been reached as to the price of material taken over at the time of the purchase; therefore the best available market figures have been used. In the main, however, they are prices furnished by the Detroit United Railway purchasing department. No bill from the Detroit Edison Company has been received and the cost of power has been estimated.

The amount of taxes chargeable against the property is estimated because the total amount of taxes for city, state and county purposes has not been definitely segregated.

On June 30, 1922, the street railway department had cash in the bank totaling $1,728,722, out of which the street railway loan has been reduced $333,000. This loan was made in lieu of selling public utility bonds.

A reserve in an amount equal to $504,182 has been set aside in a separate account called "Purchase Sinking Fund." The railway is earning on its cash balance 3½ per cent on the average daily balance up to $1,000,000 and 3 per cent above $1,000,000.

The Mayor further pointed out that an operation and maintenance balance of $142,233 has been accumulated to cover the cost of some of the rehabilitation work in the past month.

The interest on public utility bonds issued prior to the taking over of the Detroit United Railway and the sinking fund provision were properly charged to the construction cost in accordance with the Interstate Commerce Commission ruling, and for the further reason that up to May 15, 1922, the street railway system was not complete as outlined to the people when they voted the $15,000,000 bond issue in April, 1920.

This statement is not made in any boastful spirit, the Mayor stated, because it is realized that there is much room for improvement in the service. He continued:

> We naturally have to feel our way so as to live within our income. The showing we are making does show that there is possible an improvement in service, which is always our aim. Every reasonable person will understand that we had to have experience in operating the railroad to ascertain just what was necessary to give the best possible service at a reasonable fare.

The daily service schedules in the city system in June averaged 3,000 car-miles per day over the old Detroit United Railway schedules, which in itself indicated that service is constantly being improved. In keeping with the promises for increased service, the city has extended the one-fare zone to the city limits on Grand River, Van Dyke and to the farthest possible terminal on Woodward Avenue. The entire city is now within the one-fare zone.

In conclusion the Mayor pointed out that since taking over the Detroit United Railway, the city has lived up to its statements with regard to cost of operating and the possible earning per car-mile. For instance, it was estimated the cost of operation would be 30 cents per car-mile and the figures show 28 cents. Earnings show for the month of June 38 cents per car-mile. The relation of operating expenses to income shows 73 per cent, while it was estimated at 76 per cent.

According to the financial report, $57,815 was spent in June for track and road labor, as compared with $9,124 in the seventeen days of operation during May. Paving between tracks cost $16,457 in June and $3,694 in May.

Conductors and motormen were paid $442,494 in June and $244,735 in May. Car-house employees were paid $64,484 in June as against $23,274 in May. The cost per car-mile for the two months averaged 26.7 cents.

The reserve fund includes $75,007 for injuries and damages, $56,621 for sinking fund construction bonds, $216,626 for sinking fund purchase contract, $97,141 for interest on construction bond and $132,793 for interest on the purchase contract, making a total of $579,188 and making a surplus of $508,850.

Six Months' Earnings Reported

The operating revenue of the Philadelphia (Pa.) Rapid Transit Company for the six months ended June 30, 1922 was $435,251 less than it was in the same period a year ago. The operating expenses and taxes, however, decreased from $15,858,606 to $15,169,953 for the six months of 1922. The net income for the 1922 period was $1,299,707 against $1,016,408. The passenger statistics for this same six months' period shows a revenue of $20,681,618 against $21,090,749 in 1921. The total passengers carried in January-June, 1922 were 420,345,082 against 424,720,699 in 1921.

Reorganization Effected

Stockholders of the Cincinnati, Georgetown and Portsmouth (Ohio), Traction Company effected a reorganization recently with a view to rehabilitating the property. The line operates from Carrell Street in Cincinnati to Russellville, Ohio, with branches at Coney Island, Batavia and from Bethel to Felicity, Ohio.

The new officers are: L. G. Van Ness, Cincinnati, president, to succeed Henry A. Haigh, Detroit; Thomas Elliott, Cincinnati, vice-president, succeeding W. V. Thompson, Georgetown; C. T. Dehore, Cincinnati, secretary, succeeding A. L. C. Henry, Detroit. These officers and the following comprise a new board of directors; Judson Harmon, William A. Stark, C. C. Chase, C. H. Deppe and J. T. Myhan.

Mr. Van Ness, the new president, is general manager of the Cincinnati, Lawrenceburg & Aurora Electric Railroad; Mr. Elliott is a banker, while Mr. Dehore is manager of the railway department of the Cincinnati branch of the General Electric Company. Of the directors Judson Harmon is a former Governor of Ohio, Mr. Stark is receiver for the Cincinnati, Lawrenceburg & Aurora Electric Railroad Company, while Messrs. Chase, Deppe and Myhan are retired Cincinnati business men.

Officers of the company said that $150,000 would be spent in restoring the roadway, tracks and car equipment, within the next six months. An important innovation contemplated is to abandon the generating station at Lake Allyn, Ohio, and to secure the current from the Union Gas & Electric Company at Cincinnati. The traction company has been supplying current for light and power to a number of municipalities along its route, and is now negotiating for changes in the contracts in accordance with its proposed new source of supply.

Railway Announces Refunding Plan

It is announced that the $4,623,000 extended general mortgage bonds of the Union Traction Company of Indiana, Anderson, Ind., due on July 1, 1922, have been extended to July 1, 1932, at 6 per cent. This makes the second time that payment on these bonds has been extended, the first being on July 1, 1919, at that time bearing 5 per cent, when they were extended to July 1, 1922, in the hope that conditions would be more favorable for a refunding plan.

In a circular to the bondholders it was stated that the consensus of opinion sought was favorable to a ten-year extension because 80 per cent of the bonds of the Union Traction system would then expire on a uniform date and thus add greatly to the prospect of a general refunding plan. The circular said further that the extension to July 1, 1932, was proposed reserving the privilege of prepayment at any time after three years by giving sixty days notice and paying a 5 per cent premium in the fourth and fifth years and 1 per cent less for each subsequent year and par during the last year of the extension, together with accrued interest. The extension is being handled by the Equitable Trust Company, New York, N. Y., Guarantee Trust & Safe Deposit Company, Philadelphia, Pa., and the Indiana Trust Company of Indianapolis, Ind.

Long Island Property Sold

The New York & North Shore Traction Company, Roslyn, L. I., was sold for $15,000 at auction on July 24 to Michael Schiarone, a dealer of Jersey City. The sale took place in the Nassau County Court House at Mineola. The line went into receivership some time ago and suspended operations on May 3, 1920. The property comprises thirty-eight miles of track with equipment including nineteen motor and three other cars besides a power station at Little Neck Bay and repair shops at Roslyn and Flushing.

The sale was conducted by order of the court by Arthur C. Huhn, special master, to satisfy the Union Trust Company and Edward V. Hale, who have begun suits.

Cities Service Resumes Cash Dividends

The directors of Cities Service Company, New York, N. Y., have authorized the announcement of a plan for the payment of dividends in cash on the preferred stock on Sept. 1 and the preference stock on Oct. 1 and the redemption of all scrip issued for dividends on these stocks.

It is proposed to give the holders of preferred and preference stock, or the holders of the scrip issued in lieu of cash dividends on these stocks, either cash or, at their option, a special debenture bond created solely for this purpose.

Some of the details of this special bond will be that it will bear 8 per cent interest and will be convertible into 85 per cent of preference stock, and 15 per cent of common stock, with the cumulative feature on the common stock as in previous issues of debentures, and to carry an initial call price of 115 per cent of par. The directors feel this bond will serve as a reward to the stockholders who have temporarily foregone cash dividends.

Property Sale Aug. 15

The property of the Ohio Electric Railway, Springfield, Ohio, will be sold at public auction on Aug. 15. Bids of not less than $2,000,000 will be accepted at the Lafayette Street Station at Toledo. The Toledo-Lima interurban line, electric light and power are included in the property as well as the Lima Street Railway system.

In this connection a tentative draft of a twenty-five year franchise has been placed before the City Commission for the Lima Street Railway, which proposes to buy the local system from Receiver Jones. A representative of the new company states that a total of $200,000 will be spent in rebuilding and extending the line.

Financial News Notes

Railway Sold.—The Brockton & Plymouth Street Railway operating in Plymouth, Mass., has been sold under foreclosure by Receiver Gleason to J. H. Dawson, who represented the State Street Trust Company of Boston. The price was $100,000.

News-Issue Offered.—Alex. Brown & Sons, Baltimore, Md., are offering $2,500,000 of five-year 6 per cent gold notes of The United Railways & Electric Company, Baltimore, Md. The price is 98 and interest to yield more than 6.45 per cent. The bonds are dated Aug. 1, 1922, and are due Aug. 1, 1927.

Six Months' Surplus Reported.—For the six months ended June 30, 1922 the Quebec Railway, Light, Heat & Power Company, Quebec, Can., reports a surplus after expenses and fixed charges of $115,952 against a deficit for the corresponding period a year ago of $5,482. The gross earnings were $1,346,018 against $1,359,514 for the six months ended June 30, 1921.

Net Income for Six Months Period.—For the six months ending June 30, 1922, the Eastern Massachusetts Street Railway, Boston, Mass., reports a gross income of $1,276,659, against $1,175,244 for the same period in 1921. Bond interest and rentals amounted to $770,467 for the first six months of 1922. The net income was $506,191, against $374,618 for the corresponding period in 1921 and against a deficit for the same period in 1920 of $760,656.

Preferred Stock Offered.—Ray F. McGuire & Company, Des Moines, Iowa, are offering 7 per cent preferred stock of the Iowa Railway & Light Company, Cedar Rapids, Ia. The stock is offered at par ($100), either for cash or by ten-payment plan. The stock can be redeemed at 102½ and dividends. The dividends on the preferred stock of this company have been paid for more than twenty-four years. On Dec. 31, 1921, the 74th dividend was distributed.

Company Claims Bigger Return Needed.—The New York State Railways Company in its reply to Mayor Walrath's application for a reduced fare in Syracuse, submitted evidence tending to show that in order to earn a fair return on the investment value to the property in Syracuse, it should have received for the twelve months ended April 30, 1922, $351,379 more than it actually did and for the two months ended June 30, 1922, an additional $77,495. These figures for a fair return were based on a value of $8,920,000 as fixed by a former Public Service Commissioner.

Traffic and Transportation

Repopularizes Excursion Fares

Pacific Electric Railway Announces Former Thursday Reduced Fares to Beaches—Week-End Excursions

The restoration of the Pacific Electric Railway's former Thursday excursion fares of 40 cents for adults and 20 cents for children during the summer months from Los Angeles to the nearby beaches recently was announced by O. A. Smith, passenger traffic manager of the company. This special round trip fare was made effective on June 22, 1922, and continues each Thursday until Sept. 14, 1922, inclusive. The fares apply to Santa Monica, Ocean Park, Venice, Playa del Rey, El Segundo, Manhattan Beach, Hermosa Beach, Redondo Beach, San Pedro, Wilmington, Long Beach, Seal Beach and Anaheim Landing. The minimum distance for this special fare to nearest beach is 14.79 miles, while the maximum distant beach available under this excursion fare is 24.61 miles.

This is the first time these open reduced fares have been published by the company since the summer of 1919. For several years prior to 1919 similar reduced fares on each Thursday were in effect during the summer months, for one fare to all beach points herein named, and these particular reduced fares proved to be very popular.

EQUIPMENT CONDITIONS RETARD EXCURSION REDUCTIONS

During the summer months of 1920 and 1921 the equipment situation prevented the company from making these special fares effective. However, since the recent receipt of thirty new all-steel interurban cars, which were ordered two years ago, and the purchase of fifty additional cars, at a total cost for the eighty cars of $2,000,000, it has been possible for the Pacific Electric to restore the old privilege.

The original purpose in granting these reduced rates—and this is still the controlling factor—was to permit the women and children in families of very moderate means to spend a day each week during the hot summer months at the beaches for rest and recreation.

Prior to increases granted the Pacific Electric Lines in regular interurban and commutation fares by the California State Railroad Commission, which were made effective Jan. 1, 1922, the regular interurban one-way and round trip fares between Los Angeles and the beaches were under a zone blanket system of rates; that is, the regular one-way or round trip fare between Los Angeles and any one of the particular beaches in the blanket zone was one and the same fare. The commission's rate increase decision removed this blanket zone fare and the regular rates were established on a mileage basis. However, the special excursion rate for one day each week for the summer months gives a special reduced rate on a blanket basis to all beaches.

Likewise, the company also made an announcement of sweeping reductions in week-end excursion fares to beach resorts from forty-one principal interior points on its lines where agencies are maintained, exclusive of Los Angeles. These particular new excursion fares made the greatest reductions ever published and were made effective Saturdays and Sundays, with return limit the Monday following dates of sale. The reductions were made effective to all beach resorts served by the Pacific Electric Lines and average slightly more than 33 per cent.

This was the second announcement of excursion fares recently made to the beaches by the company. The first announcement being the one where the former Thursday beach excursion fare was to be restored. Inability and delay in securing additional equipment, together with other operating difficulties resulting from war conditions, has prevented the company from making excursion fares during the past few years. In addition to the company's heavy purchase of equipment, the company is completing a thorough rehabilitation of its facilities, the results of which are being reflected in its operations.

Thirty-four Buses Will Operate on Five Lines

In order to force the Tacoma Railway & Power Company, Tacoma, Wash., to reduce car fares to 5 cents, Mayor A. V. Fawcett and the City Council have arranged for the operation of not less than thirty-four buses on five railway lines in Tacoma, bus service to be started on Aug. 1. Negotiations have been closed with Spokane and Seattle jitney operators who have agreed to transfer their equipment to Tacoma and cover the five lines for a 5-cent fare.

Reduced Rates at Night

The Indiana Railways & Light Company, Kokomo, Ind., has a reduced fare rate on its interurban cars. This rate has been in effect since Dec. 1, 1921, and the amount of the reduction is 40 per cent from regular rates, i. e., night round trip fares are 120 per cent of the one-way day fare. These rates are good on regular trains after 5 p. m. each day for a passenger returning on any car on the same day. The company reports that the amount of night riding has increased.

Labor Council Opposes Fare Reduction

According to a complaint filed with the Public Service Commission of Oregon by the Housewives Council of Portland, asking that fares in effect on the lines of the Portland Railway, Light & Power Company prior to Jan. 15, 1918, be restored, "8 cents is too much for a 5-cent car ride."

After an investigation covering several weeks, the Central Labor Council of Portland recently went on record unanimously as being opposed to any reduction in existing fares. Included in the report of the special committee which conducted the investigation was the further statement that "the entire increase in revenue received by the railway company as a result of raising the fares from 5 cents to 8 cents has gone into the pockets of employees of the company and not the stockholders." The Central Labor Council appointed an investigating committee two months ago, and extended conferences were held. Three different hearings were held at which Franklin T. Griffith, president of the company, testified. The committee also had access to records bearing upon the history of the local fare situation.

New Temporary Fare Schedule for Rockford

A new schedule of fares will become effective on Aug. 1 on the lines of the Rockford (Ill.) Traction Company which will mean a saving for regular patrons but an increase of 2 cents for the occasional riders and those who pay cash fares. The order of the Illinois Commerce Commission at the same time restricts the operation of the Fay Motor Bus Company.

Under the new plan four tickets will be sold on all cars for 25 cents, good for the bearer. In addition a forty-ride ticket can be purchased for $2, good for the use of any member of the family of the purchaser for the calendar month. These tickets are to be sold at at least ten central points in Rockford convenient to the patrons. The order also includes school tickets to be used by children over twelve years of age who attend high school, thirty rides for 90 cents. The single cash fare will be 10 cents.

The order states that while all the evidence in the complaint has not been completed the commission is of the opinion that temporary relief should be granted until the final determination of the reasonable permanent rate.

W. C. Sparks, vice-president and general manager of the traction company, intimated that the company may appeal the rate decision. He said that under the new tariff the estimated average fare will be 5.85 cents, while the present average was 7.3 cents.

Rockford patrons of the electric railway have not paid a 5-cent fare since pre-war days. When the commission authorized an 8-cent cash fare, the company had petitioned for a 10-cent cash fare.

Rehearing Denial May Mean Passage of Fare Ordinance

Denial by the United States Circuit Court of Appeals at Cincinnati to grant the city a rehearing on the Louisville (Ky.) Railway injunction, under which the company is now collecting a 7-cent fare, in the opinion of city officials makes certain the passage of the car-fare contract ordinance now before the City Council in its present form. Mayor Quin publicly stated that the Council would probably be in contempt of court unless it passed the bill as it is.

James P. Barnes, president of the company, has been invited to meet the railroad committee of the lower board of councilmen immediately before the next meeting of the Council convenes. President Barnes has accepted the invitation. It is said that the point at issue with some of the dissatisfied Council members is the 7-cent cash fare with a 6-cent ticket fare. They demand a straight 6-cent fare and a guarantee of "adequate" service, it is said.

City officials predict that if the measure fails to pass the case will be in litigation at least two years before any settlement is reached and that the company's injunction, by which it collects a 7-cent fare, will obtain during that time.

Bonus Increases Courtesy and Develops Public Toleration

Winning a bonus is one thing for the men and something else for the company. For the lucky ones it means extra compensation and for the donor it means decreased number of accidents on its lines. At least, that is what it amounts to in Atlanta, Ga., where the Georgia Railway & Power Company is meeting with marked success on this bonus idea which was started some few months ago. As the bonus grows avoidable accidents decrease. In April, 564 motormen and conductors earned the $3 bonus pay for the month with a clean record. In May there were 691 men to be rewarded. Not only must the winners have a clean record on accidents, but they must also have had no disputes resulting in complaints from passengers and they must also keep strict obeisance to the rules of the company. F. L. Butler, general manager of the company, states that one of the outstanding effects of the bonus plan is that complaints from passengers have practically ceased. In his opinion this shows more courtesy on the part of the employees and more toleration on the part of the public. It also shows that cautious employees are usually the courteous employees.

Five-Cent Fare in Cleveland

John J. Stanley, president of the Cleveland (Ohio) Railway, has notified the Mayor and City Council that tentative figures showing the results of the operation of the car lines in June indicate that the interest fund is now in excess of $700,000, the point at which the ordinance calls for a fare reduction. Accordingly, Mr. Stanley says that the company is preparing to reduce the rate of fare one notch, as provided for by the grant, and that on and after Aug. 1 Cleveland car riders will ride for 5 cents or eleven tickets for 50 cents with a 1-cent charge for transfer. The present rate of fare is 6 cents cash with a 1-cent charge for a transfer. Directors of the company were scheduled to meet July 27 to hear the detailed report of the company's operation in June.

Public Co-operation Sought

Trollicar Topics has made its appearance in Jacksonville (Fla.), where the Jacksonville Traction Company is placing the pamphlet in the cars with the request "take it and read." A committee representing the employees proposes to issue this four-page leaflet weekly. The publishers of *Trollicar Topics* have invited criticism and suggestion and they express the desire to render to the public the best service possible resulting in a closer relation between the company, its employees and the public."

In the first number of the leaflet a message from the management is included. It is as follows:

> Our trainmen are the salesmen of the Jacksonville Traction Company. The passengers are our customers. Trainmen are reminded that patrons form their estimate of the company in accordance with the treatment received on the cars. It is therefore especially important that passengers shall be extended every courtesy and attention.

Transportation News Notes

Improved Service Increases Patronage.—Improved facilities provided by the Reading Transit & Light Company, Reading, Pa., to the park near the borough of Pottstown have resulted in increased patronage. A special rate has been offered to patrons riding to the park from any part of Pottstown. The new rate is effective from July 1 until Oct. 31.

Increased Rates in Effect.—The Augusta-Aiken Railway & Electric Corporation, Augusta, Ga., put into effect on July 4 an increase in the zone fare from 5 cents to 8 cents. It was announced that 7 cents would be the rate per zone for persons purchasing ten or more tokens. The ruling of the court authorizing this increase was referred to in the *Electric Railway Journal*, issue of June 10.

Files Appeal on Increased Rates.—Corporation Councel O'Brien for the benefit of Bronx taxpayers has filed an appeal with the New York Transit Commission from its recent order giving permission to the New York, Westchester & Boston Railroad, New York, N. Y., to advance its fare within the city limit from 5 cents to 7 cents. The city contends that the petition for increased rates was made on war-time prices.

Injunction on Fare Order Issued.—Judge Page Morris of the Federal Court issued an injunction on July 19 to prevent the State Railroad & Warehouse Commission from enforcing its order July 14 allowing the Duluth Street Railway a fare of 6 cents or five tokens for 25 cents effective Aug. 1. The hearing was set for July 29, in St. Paul. The city of Duluth had planned an appeal from the commission in the district court of St. Louis County.

Plan for Handling Traffic Tried.—A plan of "islands of safety" for the expediting of trolley traffic and the better protection of passengers was put in force in Springfield, Mass., on June 27 in the busy part of Main Street. The "islands" are outlined in white paint, and the plan enables automobiles to pass more rapidly than otherwise would be possible. Parking of automobiles is prohibited within thirty feet of either end of an "island." The plan is to be given a month's trial.

Will Reduce Fare.—The Grand Rapids, Grand Haven & Muskegon Railway has notified the City Council of Grand Haven, Mich., that it will reduce the fare from 6 cents to 5 cents on the Highland Park-Grand Haven run. The action was taken after the City Council passed an ordinance regulating the buses on the run. The city contended the company had no legal right to make the 6-cent charge as the franchise provided for a 5-cent fare. Highland Park is a resort center, where many Grand Haven people reside during the summer.

Fare Issue Deferred.—The United States Supreme Court has been requested by the Georgia Railway & Power Company, Atlanta, Ga., to review the decision of the Supreme Court of Georgia in its case against the Mayor and Council of the City of College Park. The company seeks to invalidate an ordinance of the Council forbidding the company from increasing its fares on the College Park line from 5 cents to 7 cents per passenger. The lower court upheld a suit of the council enjoining the company from exacting the increased fare. The case will not be considered by the court, however, until it reconvenes in October.

Electric Proud to Transport Washers.—The Illinois Traction System, Peoria, Ill., has the distinction of being the first electric railroad to carry a trainload of washing machines. This immense shipment of A B C washers consigned by the Altofer Brothers Company to the Morton Electric Company, St. Louis, Mo., caused much excitement along the way. Considerable interest was attached to the incident because the officials of the traction company considered the shipment an important one and established a precedent by giving this trainload the right of way on a daylight run from Peoria to St. Louis. No. 11 of Vol. 3 of The A-B-C of Selling, "Published in the interests of the World's Best Washing Machine," writes up this achievement of the Illinois Traction System.

Personal Mention

J. P. Ingle Takes Over Management of Jacksonville Traction Company

J. P. Ingle, who has been looking after the interests of Stone & Webster in many parts of the country, is now taking over the work of manager of the Jacksonville (Fla.) Traction Company. He succeeds Hardy Croom, who has been transferred to Boston to take charge of some special work for Stone & Webster.

Mr. Ingle for the past two years has been in Haverhill, Mass., in charge of the Stone & Webster property there. His work for eleven years previously had been in Keokuk, Iowa, where he went as superintendent of the Keokuk Electric Company. In 1914 he became general superintendent, and in 1915 manager of the company. The Keokuk Electric Company does the electric railway, lighting, power and gas business in several towns in Iowa and Illinois. He was president of the Iowa Electric Railway Association in 1919.

Twenty-seven years of service in the public utility field is Mr. Ingle's record. His work has ranged from that of office boy, billing clerk and bookkeeper with the Atlanta Gas Light Company, assistant superintendent of the Gas Light Company of Columbus, Ga., and superintendent of the gas department of the Boston Rouge (La.) Electric Company. He was graduated from the Georgia School of Technology.

H. G. Mason Made Superintendent

H. G. Mason has been made superintendent of transportation of the Ohio Electric Railway, Springfield, Ohio. Other appointments recently made are: Executive, C. W. Randolph; superintendent city lines, O. J. Mannon; superintendent light and power, W. C. Winemiller; engineer power station, D. O. Snider; superintendent shops and substations, J. B. Corderman; engineer maintenance of way, J. F. Cupp.

I. W. Miller Leaves Olean Company

Irving W. Miller, for the past twenty-five years general superintendent of the street railway and branch lines in Olean, N. Y., of the Olean, Bradford & Salamanca Railway, has severed his connection with that company. Mr. Miller has made no plans for the future, but will spend some time at rest after his many years of strenuous labor.

Mr. Miller began his street railway career as a conductor in 1890 on the lines in Newark, N. J. In 1891 he went to Allentown, Pa., where he was employed as master mechanic at the carhouses there for several years. From Allentown he went to Lancaster, Pa., where he was placed in charge of construction work for the Lancaster Railway Construction Company. He was afterward also employed in various capacities at New Castle, Pa. In 1897 he went to Olean, where he has been since. He opened up the Portville line of the Olean, Bradford & Salamanca Railway and superintended construction of its lines to Bolivar, Shinglehouse and Salamanca.

H. S. Fleming President of Scranton, Montrose & Binghamton Railroad

At the permanent organization of the board of directors of the Scranton, Montrose & Binghamton Railroad, Scranton, Pa., Henry Stuart Fleming, New York City, was elected president of the company. R. W. Day was elected vice-president. He will continue as general manager.

H. S. Fleming

Mr. Fleming is a constructive engineer and his association with the company will mean the development of the property and the assurance of financial strength. He is well known in New York and London from his success in reorganizing old properties and greatly increasing their usefulness. From time to time he has had a hand in the management of railroads, navigation companies, public utilities, coal corporations, iron and steel plants, irrigation, telephone, timber and miscellaneous manufacturing concerns. In much of this work he has acted as the agent of bankers, numbering among his clients some of the principal banking institutions of the day.

He was graduated from the University of Pennsylvania in 1883 with degrees of analytical chemist and metallurgical engineer, opening his engineering office in Chattanooga, Tenn. He later took charge of blast furnaces, coal and iron mines in Dayton, Tenn.; Mayville, Wis., and Emporium, Pa. In 1890 he opened an engineering office in New York and shortly afterward, at the solicitation of the late C. D. Simpson, became secretary and treasurer of the Anthracite Coal Operators' Association, retaining this position until the purpose of the association was accomplished and it was disbanded.

From the mining field he passed to other large industrial operations, serving as adviser, financial expert and in many cases as the executive head of important enterprises, among them the Staples Coal Company of Boston and other enterprises in which he acted for Edward J. Berwind, financier, the Montana Coal & Iron Company, which he built up from a small operation to one of the best and most practical coal companies in Montana, and Canadian Collieries (Dunsmuir) Ltd., on Vancouver Island, B. C. He is also associated with Colgate Hoyt & Company and E. C. Benedict & Company of New York as a director and in charge of the operations of the Moju Rubber Plantations Company, owning rubber plantations in Brazil; with E. C. Benedict & Company as a director of the Roadless Patents Holding Company, owners of the American rights in a new form of suspended caterpillar tractor developed by the British War Office, and has for many years been a director of the Empire Trust Company of New York.

He is a member of the American Society of Mechanical Engineers, American Institute of Mining Engineers, American Chemical Society, American Society for Testing Materials, International Association for Testing Materials, North of England Institute of Mining and Mechanical Engineers and the American Geographical Society.

Charles Day, has been elected vice-president of the Citizen's Traction Company, Oil City, Pa. He succeeds James Crosby Brown.

G. F. Russell is now superintendent of public utilities of Seattle, Wash., succeeding Carl H. Reeves. As such he is in charge of affairs of the Seattle Municipal Railway.

C. A. Leland, Jr., who has been operating superintendent of the Atchison Railway, Light & Power Company, Atchison, Kan., has been promoted to the position of general superintendent, which was previously held by J. W. Waggener.

R. S. Huber, is now holding the position of superintendent of the Northwestern Ohio Railway & Power Company, Oak Harbor, Ohio, left vacant by the resignation of E. O. Shryock. The latter is now superintendent of the Columbus, Newark & Zanesville branch of the Ohio Electric Railway.

Ross Murphy, newspaper man of Memphis, Tenn., has been appointed director of the Tennessee Public Service Information Bureau, which has just started to issue a news bulletin of general utility information. Headquarters of the information bureau are in the Chamber of Commerce Building, Nashville.

DISCUSSIONS OF MARKET AND TRADE CONDITIONS FOR THE MANUFACTURER, SALESMAN AND PURCHASING AGENT

ROLLING STOCK PURCHASES BUSINESS ANNOUNCEMENTS

Priority Orders for Coal Movement

In order to facilitate rapid movement of coal, the Interstate Commerce Commission, in an order effective July 26, 1922, established five classes of preferential consumers to whom coal shall be delivered. Public utilities are listed in Class 2 of preferred consumers.

The various classes and the purposes designated are:

1. For such special purposes as may be designated by the commission.

2. (a) Fuel for railroads and other common carriers and for bunkering ships and vessels. (b) For public utilities which directly serve the general public under a franchise therefor, with street and interurban railways, electric power and light, gas, water and sewer works. Ice plants and hospitals are also included. (c) For government institutions, hospitals, schools, etc., and to common carriers which supply coal to these institutions.

3. For bituminous coal consigned to any Lake Erie ports for trans-shipment by water to points on Lake Superior.

4. Commercial sizes of coal for domestic use.

5. Coal for other purposes.

Representatives of public utilities of New York City conferred with Secretary of Commerce Hoover on Wednesday in connection with plans to secure necessary coal for such utilities. Conferences were also held with representatives of the Shipping Board looking to the use of coal which is being imported from abroad by the board.

Marion Properties Coal Supply Good

Marion, Ohio, industries seem to be in no immediate danger of shortage of fuel on account of the coal and rail strikes. The Columbus, Delaware & Marion and the Columbus, Marion & Bucyrus interurban lines have supplies sufficient for six months.

Electric Railway Construction in Spain

The United States Department of Commerce reports a total of 12 km. of new street railway as put into operation in Spain during 1922: The line from Avilés to Salinas (Oviedo), 6 km. in length; the Armilla-Alhendin (Granada) section, 4 km.; and the Sol-Atocha portion of the Madrid subway, 1.81 km. In addition, work has begun on the Metropolitano de Barcelona, which will join the port with San Gervasio, passing through the Plaza de Cataluña. A second enterprise, the Gran Metropolitano de Barcelona, has secured concessions for a line to cross that city in an opposite direction from Sans, an industrial suburb, to the Norte Railway Station, also traversing the Plaza de Cataluña.

Several different electric railway lines are in operation or being constructed. On the Metropolitano de Madrid the section Sol-Ventas and the extension of the section Atocha-Vallecas are in actual operation. Work is under way on the line from Granada to Zubia, and also on the Call d'en Rabassa al Arenal in Palma de Mallorca. The work on the extension of the railway from Correño to Avilés, a distance of 25 km., is well under way and will be completed this year. The main line of this road, running from Gijón (Musel) to Veriña, Aboño and Candas, was electrified in 1920.

Altogether, four interurban electric railways have been put in operation: The first, from Barcelona to Sarriã, now extended to Manresa (about 65 km. away); the second, from Pamplona to Sanguesa (54 km.); the third, from San Sebastiãn to the French frontier at Hendaye, a distance of 23 km., and the fourth, the line from Musel to Avilés (mentioned above), 32 km. in length. Petitions for concessions covering new interurban electric railways and street railways are numerous.

Powdered Fuel to Be Used in St. Louis

The Union Electric Light & Power Company, subsidiary of the North American Company, has decided on plans for a $6,000,000 power plant in St. Louis in which powdered fuel will be burned.

The reasons for this decision are not necessarily applicable to other large plants, but depend on quality and price of fuel, site of the plant, general layout, load factor and other conditions, so that each individual case must be worked out according to its own merits. Extensive tests and investigations on stoker equipment in comparison with pulverized fuel indicated to the designing engineers that the latter contains advantages under conditions obtaining at this plant.

The present plant is situated 20 miles from the center of the coal mining district, so that the fuel costs approximately $2.50 a ton and contains in the neighborhood of 17 per cent ash; hence the decision to use powdered fuel is here of marked significance.

The initial installation will include eight B & W boilers of 18,000 sq.ft. of heating surface each, with one 30,000-kw. single-cylinder General Electric and also a Westinghouse unit of the same size. The plant will ultimately contain eight similar units. Steam will be supplied at 300 lb. absolute, 690 deg. at the throttle, the boilers being arranged for 350 lb. pressure. Economizers will not be installed.

An unusual feature will be the installation of the Lopulco System for powdered fuel, by the Combustion Engineering Corporation, in the boiler room; this is contrary to the usual practice of installing the powdered coal equipment in a separate building.

McClelland & Junkersfield, Inc., the consulting engineers and constructors in charge of this project, point out that improvements may be expected in the development of stokers as well as in pulverized fuel equipment, but that stokers have been under development for a long period of years and the burning of coal in pulverized form in large quantities by central stations has been done only in the last few years.

Activity in Car Building Business

The United States Department of Labor through the Bureau of Labor Statistics compiles monthly reports concerning the volume of employment from representative establishments in twelve manufacturing industries. Among these is that of car building and repairing, whose figures for June, 1922, compared with June, 1921, are as follows:

STATISTICS OF CAR BUILDING INDUSTRY

	June, 1921	June, 1920	Increase per Cent
Number of establishments reporting....	61	61	....
Number on payroll..........	44,462	58,025	30.5
Amount of payroll..........	$3,057,619	$3,481,629	13.9

There was an increase in June, 1922, over May, 1922, of 6.9 per cent in number of men on the payroll and 10.6 per cent in the amount of the payroll. This is an increase of 3.4 per cent per capita.

Other industries showing increases in amount of payroll between June, 1922, and June, 1921, are iron and steel, 40.7 per cent; automobiles, 24.7 per cent; hosiery and underwear, 15.2 per cent; leather, 14.4 per cent; paper making, 12.0 per cent. Decreases were shown in the other five industries listed, namely, cotton manufacturing, 34.0 per cent; silk, 33.8 per cent; cotton finishing, 22.6 per cent; men's clothing, 10.9 per cent; cigar manufacturing, 10.5 per cent.

Metal, Coal and Material Prices

Metals—New York	July 25, 1922
Copper, electrolytic, cents per lb.........	13.687
Copper wire base, cents per lb...........	15.625
Lead, cents per lb......................	5.70
Zinc, cents per lb......................	6.25
Tin, Straits, cents per lb................	32.50
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons......................	$7.675
Somerset mine run, Boston, net tons......	3.75
Pittsburgh, mine run, Pittsburgh, net tons	....
Franklin, Ill., screenings, Chicago, net tons	...
Central, Ill., screenings, Chicago, net tons	....
Kansas screenings, Kansas City, net tons	4.25
Materials	
Rubber-covered wire, N. Y., cents per lb..	5.90
Weatherproof wire base, N. Y., cents per lb.	15.50
Cement, Chicago net prices, without bags...	$2.05
Linseed oil, (5-bbl. lots), N. Y., cents per gal.	91.50
White lead, (100-lb. keg), N. Y., cents per lb.	12.50
Turpentine (bbl. lots), N.Y., per gal......	$1.20

Rolling Stock

New York Consolidated Railroad, through its receiver, Lindley M. Garrison, has stated that in accepting the recent order of the New York Transit Commission the terms are accepted with the understanding that the fifty all-steel cars to be ordered shall be trailer cars.

Savannah (Ga.) Electric & Power Company through Manager Brooks has announced that the thirty one-man cars recently purchased will be installed for service as rapidly as they are delivered by the manufacturers. Reference was made to this purchase in the *Electric Railway Journal*, issue of July 22.

Louisville (Ky.) Railway expects to purchase fifty or more single-end safety cars built according to standard specifications except that they will be equipped with a separate exit and entrance doorway, each door to be operated by a separate door engine. The placing of the order is contingent upon the passage of an ordinance now pending before the Louisville general council.

Track and Roadway

Reading (Pa.) Transit Company will pave between its tracks on Cumberland Street between Fourth Street and Lincoln Avenue in Lebanon.

Gary (Ind.) Street Railway will reconstruct its tracks and repave its right of way following the recent improvement order of the Board of Public Works.

Community Traction Company, Toledo, Ohio, has received the approval of the council for repaving between the rails of Ashland Avenue, East Broadway and Woodville Street.

Trenton & Mercer County Traction Corporation, Trenton, N. J., used steel ties for the first time in the history of the concern, in connection with the laying of new tracks on South Clinton Avenue and on East State Street.

Cincinnati, Georgetown & Portsmouth Traction Company, Cincinnati, Ohio, expects to spend $150,000 in restoring the roadway, tracks and car equipment within the next six months.

Quebec Railway, Light, Heat & Power Company, Quebec, Can., has been notified by the City of Quebec that it must start work upon the proposed extension on Dorchester Street and on the Charlesbourg Road before Aug. 1.

Knoxville (Tenn.) Railway & Light Company will construct the loop on Walnut Avenue between Clinch and Union Avenues. The improvement will involve an expenditure of between $20,000 and $25,000.

Omaha & Council Bluffs Street Railway, Omaha, Neb., is tearing up its old track and laying new steel for more than a mile on North Sixteenth Street and for about the same distance on Sherman Avenue.

Public Service Railway, Newark N. J., is making improvements to its roadway on Haddon Avenue, Collingswood, Westmont and Haddonfield. The roadbed is being relaid and graded to the level of the pavement and new rails are being placed.

Southern Indiana Gas & Electric Company, Evansville, Ind., will pave the streets between car tracks soon. The improvements will cost about $15,000. The company will ask permission to lay double tracks in Walnut Street. This improvement will cost approximately $40,000.

Trenton Bristol & Philadelphia Street Railway, Philadelphia, Pa., has abandoned temporarily plans for the construction of an extension of the tracks down the foot of Market Street, to the foot of the Delaware River, Bristol, Pa. It was the intention of the company to run a siding from the Radcliffe Street division to expedite traffic to Island Beach in the Delaware River. The cost of construction is considered too high at this time and the project was laid over.

Springfield (Mass.) Street Railway has announced track-laying projects for the season estimated to cost $131,000. The double-track line to Indian Orchard, Ludlow and Palmer is to have new rails on Berkshire Avenue between Bay Road and Harvey Street, about four-fifths of a mile, at a cost of $45,000 and for about one-fourth of a mile in North Wilbraham at a cost of $15,000; the Belmont Avenue single-track line is to be renewed from Bellevue Avenue to Oakland Street, about three-fourths of a mile, at a cost of $21,000; the Liberty Street line is to be double-tracked from Fisk Park to St. James Avenue, about four-fifths of a mile, at a cost of $30,000; the Longmeadow line from the Green north is to have new tracks totaling about one-half of a mile at a cost of $10,000; the line to Holyoke is to have a half-mile of new track in West Springfield at a cost of $10,000. Several shorter renewals will be laid at an average cost of $5,000 per project.

Power Houses, Shops and Buildings

Northern States Power Company, Fargo, N. D., opened up recently its new office and appliance display room at Sioux Falls, S. D. Practically all departments of the company are now grouped in one building.

West Jersey & Seashore Railroad has announced that an agreement has been reached with the Pennsylvania Railroad whereby power will be purchased from the Philadelphia Electric Company. Work on the necessary connecting line will be started at once. The line will run across the Delaware River bridge and connect with the West Jersey & Seashore line in Westville. The current now used by the railroad is generated at its Westville plant. It has not yet been decided whether this plant will be abandoned or maintained for auxiliary and emergency use.

The Union Street Railway, New Bedford Mass, has recently increased the generating capacity of its Parker's Wharf Power Station by 2,000 k.w. This station, which was completed in 1919, provides direct current at 600 volts for the operation of the railway system in and about New Bedford and has now a total rated capacity of 6,000 k.w. The electrical work on this installation was by Ernest Howarth & Company, New Bedford, and the piping by the Lumsden & Van Stone Company of Boston. Engineering and general construction was by the Harry M. Hope Engineering Company of Boston, which was also the engineer on the original installation.

Trade Notes

Westinghouse Electric International Company recently extended its offices in Mexico City, Mexico. The company also maintains large warehouses on the outskirts of the city where quantities of stock are kept on hand to meet trade demands.

Automatic Register Company, St. Louis, Mo., announces that it has an automatic fare register on exhibition at the works of the St. Louis Car Company, St. Louis, Mo., and all interested are invited to inspect this exhibit.

Griffin Wheel Corporation, Chicago, Ill., is converting its brass foundry at South Tacoma, Wash., into an electric furnace foundry by installing Baily resistance type electric melting furnace equipment. The furnaces are built by the Electric Furnace Company of Salem, Ohio.

New Advertising Literature

Schweitzer & Conrad, Inc., Chicago, Ill., has issued a folder entitled "Lightning Arrester Performance." This gives information in regard to the company's type H arrester.

General Welding & Equipment Company, Boston, Mass., has issued a booklet in connection with its welding and cutting equipment. This gives information regarding automatic cutting and welding machines.

Link Belt Company, Chicago, Ill., has just issued a booklet, No. 444, describing its power hoe. This is an improved form of drag scraper for handling coal, gravel, sand or similar material.

Economy Electric Devices Company, Chicago, is distributing a folder describing the electrical and mechanical characteristics of the Lind aluminum field coil, for which it has recently become the general sales agent. The saving in weight possible by replacing copper with aluminum steel coils is shown in tabular form for a number of various types of motors.

The Traffic Leak via Telephone

AT DIVERS times this paper has had something to say with regard to the connection between the telephone and the street railway; how increased use of the former often follows decreased use of the latter. One interesting way in which this relationship came to light in a certain community was in the change of policy by a large "cash and carry" grocery.

This grocery had built up its business to a volume that had its old-time delivery rivals thoroughly frightened. This had occurred during a period when fares were low and traffic at its maximum. The store was located in the downtown area, so that most patrons had to make use of the street cars. When the fares were almost doubled, however, there was a sharp falling off in this personal, take-it-home shopping. It was not the prices that were at fault, but the public's sudden awakening to the fact that carfare really existed and was now an item to be taken into consideration.

What did the merchant do about this situation? Perhaps he spent a few minutes in cussing out the street railway, which had followed the upward swing of prices long after the groceries of the town. Or perhaps he didn't cuss. At any rate, he was a practical philosopher and reasoned that if people would no longer come to him, he would have to go to them. So he installed a battery of telephones and uttered the old "Cash and Carry" slogan in whispers only. His clerks now sell by telephone. Unlike the street car, the telephone doesn't help to carry the goods home. The street railway is out the fare, and doubtless the customers and the grocer must share between them the increased cost of doing business via telephone instead of street railway.

Of course, this is only one of the many ways in which the telephone acts as an apparently cheaper substitute for the street car. The word "apparently" is used because personal shopping or face-to-face discussion is in the long run the most satisfactory for all concerned. Here is a most effective argument for the increase in car riders and one that at the same time will meet with the hearty indorsement of every merchant in town.

Paris Now Has a Super-Power Plant

DURING the past few years a number of great power plants have been put into commission, notably in this country, for the purpose of cutting the cost of producing a kilowatt-hour of electrical energy. They might properly be termed "super-power plants" by virtue of their size as compared with the usual plant. There are now several coal-burning plants in this country with ratings of 150,000 kw. or more and they are producing a kilowatt-hour from less than two pounds of good coal, corresponding to, say, from 20,000 to 25,000 B.t.u. in the coal per energy unit turned out.

The latest competitor for honors in this field is the Gennevilliers power plant of the Union d'Electricité, located in the suburbs of Paris. It is now approaching completion. No operating results are as yet available, but from the guaranteed steam consumption of the turbines, less than 9.5 lb. per kilowatt-hour at the best load, there is no doubt that the fuel consumption will be very low. It may well break the record in this particular; only time can tell. Such scrupulous care has been taken to utilize the possibilities of what the late Robert H. Thurston called "the power and potency of high-pressure steam" that it would be a disappointment to power plant engineers everywhere if the results at Gennevilliers should prove disappointing.

What are some of the ways in which, in this case, more than usual of the available heat in the steam has been tempted to transform itself into mechanical energy? In the first place the high throttle pressure of 313 lb. gage with 280 deg. F. superheat was adopted. Thus the steam temperature is above 700 deg., which in itself insures a low fuel consumption. Then flue gas, generator and other losses are trapped and returned to the feed water and the air for the furnaces is preheated by the flue gases. Every possible provision is made to preserve perfect heat balance in the plant.

Recent giant power plants have been designed with such skill that no sensational results can be expected in the latest one. Locally it will prove astonishing to those who have not kept pace with the latest developments, for it will cut down energy costs tremendously. In addition it will play an important part in transportation in the Paris vicinity and will ultimately form a part of a super-power system now being developed in sections by the great steam railroads of France.

More to Be Pitied than Censured

SEVERAL papers in New York City are disposed to be over-critical of the railway in commenting on the recent power accident which compelled a suspension of service during the rush hour on the Brooklyn Rapid Transit on July 25. In view of two or three interruptions to service recently on the transit lines in New York the easiest thing to do is of course to blame the companies. The facts are, however, that both the Interborough subway short circuit of July 6 and the B.R.T. power house accident were untoward incidents of operation ever potentially present but seldom actually occurring. So far as the Interborough is concerned the company has been exonerated by the transit commission in that it has been found that the deadly fumes from which passengers suffered were generated from the burning insulation, copper, paint and other substances, and that no hazard was present to passengers because the company had not exhausted its resources in the search for some other means than that which is used for preventing fire in its cars. In the Brooklyn case a fire following a short circuit in an oil switch in the main generating station had to be fought with water because the flames spread to nearby apparatus. In suppressing the fire enough of the water leaked through the floors to necessitate the shutting down of the generators.

The Brooklyn accident should be remembered, if at all, for the excellent and prompt way in which the company reassured passengers in its stalled cars and trains and for the expediency with which service was resumed.

The transit companies are just as anxious to render travel on their lines safe as is the public in desiring to be safe or as are the public officials in seeking to make travel safe. A moment's serious reflection ought to be enough to prove this to be true. But even a moment's serious reflection is too much for politicians with axes to grind. In both the Brooklyn Rapid Transit and the Interborough cases there was a combination of circumstances extreme in their degree of probability of recurrence. If anything both accidents serve to illustrate how greatly attenuated and refined are the elements which tie together the transportation arteries of any metropolitan transportation system and how unerring they usually are in functioning day in and day out.

Co-operation with Municipal Engineers on Track Problems Is Essential

THE subject of tracks in paved streets is one of the most important now, as ever, before electric railway engineers for study. Its status was clearly outlined in the paper read before the Engineers' Club of Philadelphia some months ago by E. J. McIlraith, of the Philadelphia Rapid Transit Company. Mr. McIlraith's analysis was abstracted in the issue of this paper for July 29. The following comments are intended to reinforce his statement of the situation:

The problems which require solution in this connection are numerous and pressing. The very fact that electric railway engineers have not settled upon one, two or even three general types or standards to be adhered to in surface-track construction indicates the difficulty which lies in the path of such an action. Municipal engineers have sometimes criticized railway engineers because more has not been done in this direction. They have not fully understood the nature of the situation, which is three-fold:

First, there is the limited knowledge of the nature and bearing power of soils in streets at the sub-grade level, for neither the municipal nor the railway engineer has made much of a study of sub-soils. Until more is known about the stability of these soils and the need for drainage, there will be considerable hesitancy in the setting up of any standards of construction which can be applied to a large extent all over the country. Here seems to be an opportunity for an extended and careful study of soils, involving samples taken from numerous and widely separated locations. These samples might be analyzed at Washington. Tests of the various soils for ability to retain or discharge moisture must be made and further tests are desired with respect to the action of these soils under varying loads and temperatures. In the tests the soils should be confined as they are in the streets, but slightly below the surface at the bearing level or subgrade.

Second, there is the general division of engineers into two camps on the relative merits of the solid concrete, or rigid type of construction as compared with the resilient or ordinary stone ballast construction for tracks. Municipal engineers seem to recognize this important factor in their proposed specifications for track construction, which describe not only the two foregoing types but also the concrete-slab sub-ballast type of construction which is having some vogue.

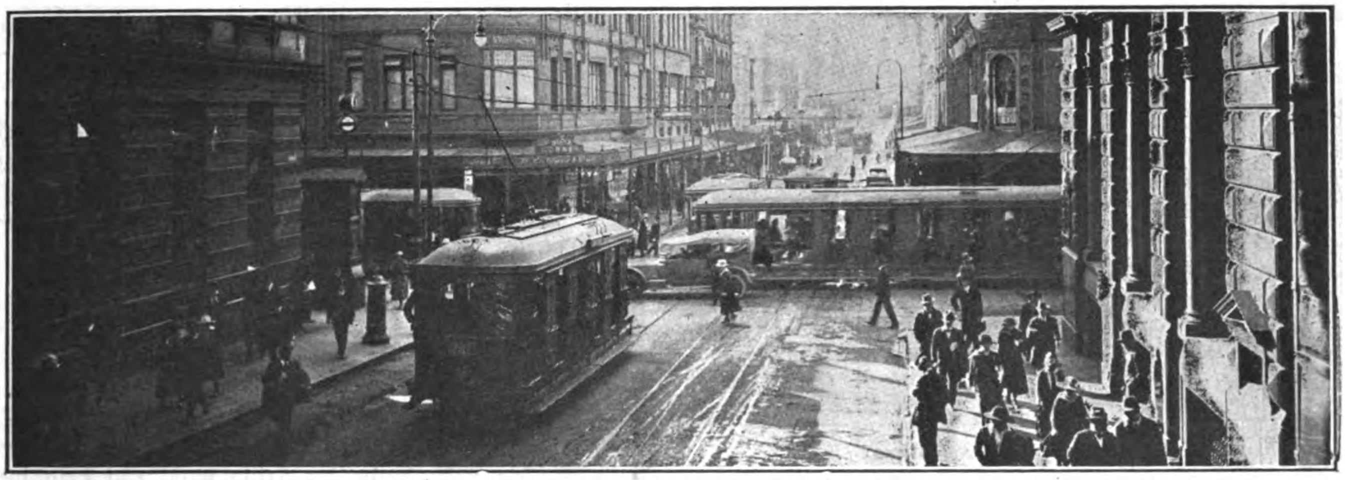
Third, the question of what constitutes a proper or efficient type of pavement for a track has never been fully settled. There is no doubt, however, that several distinct types of pavements can successfully be installed and maintained in street railway tracks, provided they are carefully selected to suit the tracks and with due regard to vehicular traffic.

It must be admitted that many good track pavements have been disrupted by inadequate track construction. Frequently an attempt unduly to prolong the life of a track has led to trouble along these lines. Again, municipalities have sometimes forced the railways to install inappropriate types of pavements in tracks, and have, nevertheless, afterwards blamed the railways for their early failure. The impression that some municipal engineers seem to have to the effect that tracks cannot be properly paved is erroneous, because there are many miles of well-paved tracks about the country which are standing up well under the most severe usage.

The attempt to limit or define the details of the track proper in such matters as joints, rail fastenings, tie plates, ties and similar items has little merit. It would be far better to make statements of the desired qualities and allow some choice in the methods which may be used in meeting them. Certainly no municipal engineer would attempt to set up a single kind of asphalt or a single kind of brick for use in pavements all over the country, nor would he try to tell his brethren how he should regulate the crowns and grades of his streets without first seeing the actual conditions to be met.

Another feature of track maintenance in streets which involves consideration in the design of tracks is the constant disruption of the pavement and roadbed caused by openings made to accommodate sewer and water-main construction, to say nothing of other openings made incidental to the installation of the services of the various utilities such as telephone, electric light and gas companies. It frequently happens in the course of reconstruction of a set of tracks in the streets, that even before the work is finished the track is ripped open somewhere to permit the making of house connections or to accommodate some one of the above-mentioned utilities. Such openings cannot fail to harm the track structure, to say nothing of the pavements which are seldom properly restored following such openings. Damage to track pavements, which the laws require the railways to maintain, when caused by other than railway forces, are a source of misunderstanding.

From the considerations outlined it is evident that a more thorough co-operation between municipal and railway engineers relative to track pavements is highly desirable to be brought about. A better mutual knowledge of the controlling factors will benefit both municipalities and railways. It is to be hoped that the Engineering Association in its joint study with the American Society for Municipal Improvements will be able to convince the latter that the subject is one which may require a year or two of continued conferences before an agreement can be reached upon the fundamentals. Snap action would be most unfortunate.



INTERSECTION OF GEORGE AND KING STREETS, SYDNEY, WHERE A HEADWAY OF EIGHT SECONDS IS MAINTAINED

Rolling Stock for Sydney Metropolitan Electric Service

A Description of Some of the Street Traffic Problems Encountered in Sydney, Australia, and the Necessity for Using Cars of Large Carrying Capacity for Handling the Rush-Hour Loads—The Latest Type of Tramcar Construction Is Also Given

A BRIEF ARTICLE of the New South Wales Government Tramways in Sydney, Australia, with map, was published in the ELECTRIC RAILWAY JOURNAL for July 6, 1918. Certain service conditions and details of new rolling stock now being placed in operation were recently given in a paper read before the Sydney Division of the Institution of Engineers of Australia by William Alexander Gordon Douglas. Much of the information given in this article is taken from that paper. The illustrations used were not a part of the paper as presented by Mr. Douglas, but are reproduced with the permission of the New South Wales Government Tramways through C. F. Dewey.

Sydney, like most large cities, has its congestion problems, and during the rush hours the tramway load in the city sections has reached large proportions. The figures in Table I show the number of cars or trains on ordinary weekdays during the evening rush hour, which occurs between 5:15 and 6:15, on certain business streets.

Table II shows a number of different types of cars in service, how used, when placed in commission, and the annual mileage, based on the record during the first five months of 1920.

The average number of passengers carried per outward-bound tram in George Street during the rush hour is eighty-five; a considerable proportion of the units in question being pairs of large coupled cars. Experience has shown that any increase in the number of trams in George Street over and above the figures given in the table results only in a dislocation of the service, despite the utmost efforts of the staff, and on this line it must be accepted that under the present system the limit of headway has been reached.

Prior to the war the number of passengers carried per annum per head of population had reached 362, and though the figure for 1920 did not nearly reach this level it is again rising rapidly, as is also the total population, showing clearly the necessity for rapid development of the service to anticipate the traffic demands.

TABLE I—SYDNEY CITY SERVICE, RUSH-HOUR CONDITIONS

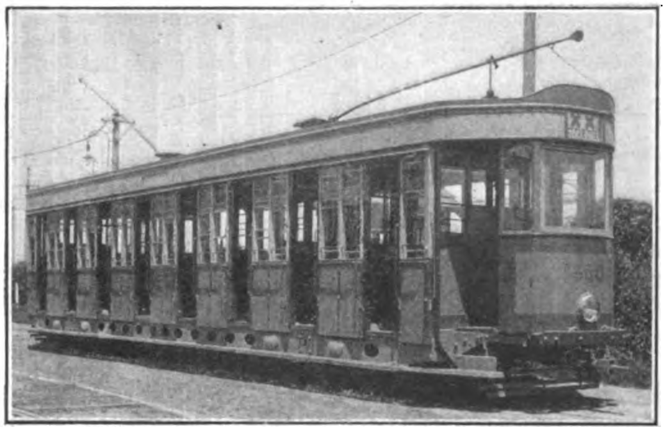
System	No. of Cars Or Trains During Rush Hour	Headway In Seconds
George Street and King Street Crossing (four ways)	438	8
Elizabeth Street and King Street Crossing (four ways)	380	9
King Street only, one way	62	58
Pitt Street only, one way	143	25
George Street West, one way	200	18

Table II, covering the annual mileage of each class of car in the service, shows the extent to which the larger units are used, this being particularly noticeable in the case of the "L" type cars, where the annual mileage of the single cars with fifty-five seats is only 5,500, compared with 18,600 miles for the coupled sets, which seat 110 passengers.

Special attention was given to keeping the steps of the "O" type car as low as was possible under the conditions prevailing at the time, and suitable recesses,

TABLE II—ROLLING STOCK OF THE SYDNEY METROPOLITAN TRAMWAYS—TYPES OF CARS, DATES OF BUILDING AND ANNUAL MILEAGE

Types	Cars			How Used	Placed In Commission	Annual Mileage Based on First Five Months of 1920.
	Type	Seats	Number			
Single-truck closed	(C)	22-26	51	In trains	1897-9	2,200
Single-truck combination	(D)	34	16	In trains	1899	3,300
St. Louis and Brill coupled	(G)	49	16	In trains	1899-1900	15,600
Double-truck combination	(L)	55	251	Mainly trains	1900-02	14,200 (single, 5,500; coupled, 18,600)
Single-truck cross-seat for trains	(E)	45	202	In trains	1901-03	20,000
Seventy-passenger	(N)	70	90	Single	1901-06	16,000
Single-truck cross-seat single	(J)	50	47	Single and in trains	1904-08	14,600
Tourist single-truck	(H)	50	2	Single	1907	17,500 (vary considerably)
Tourist double-truck	(M)	70	2	Single	1907	5,500 (vary considerably)
Single-truck cross-seat combination	(K)	50	107	Mainly coupled	1908-13	17,800
Eighty-passenger	(O)	80	626	Coupled and single	1908-14	22,300



NEW TYPE OF CAR FOR SYDNEY

into which the wheels project, were provided in the floor. The wheels of the "O" type are 33 in. in diameter on the tread, but the height from the rail level to the under side of the floor is only 30½ in., with the exception of the two compartments over the truck centers, where the corresponding dimension is 33½ in.

NEW TYPE OF CAR

In view of the foregoing, it was decided that the new standard cars, to be known as "Type P cars," should all be motor cars of the maximum size which could be operated over the existing system, this decision being governed by the rush hour and special traffic demands, and not by the normal average loading. This is a confirmation of the policy adopted in 1908, when it was first decided to build eighty-seat cars, of which 626 have since been put into service. All the new standard cars will also be fitted with automatic car, air, and electric couplers so that they may readily be connected up as two-car trains for periods of heavy traffic.

The management realizes that these cars are too large and heavy for the most economical handling of the average normal load but it is thought it is only by their use that an immediate improvement can be effected in the rush-hour city service, under the existing conditions of routes, etc. Steps are being taken, therefore, to obtain also a limited number of small light-weight safety cars of the American pattern, with pneumatic door and step control and other automatic safety features. These cars will be tested on some of the suitable routes, and the future policy regarding the use of "one-man" cars for the Sydney tramways will no doubt largely depend on the results obtained.

GEORGE STREET, SYDNEY, SHOWING THE QUEEN VICTORIA BUILDINGS

PROVISIONS FOR COMFORT AND CONVENIENCE OF PASSENGERS

In the "P" type of car the height of the steps has been reduced by 3 in., as compared with the "O" type, through the use of a smaller diameter of motor, but cross benches with protection from wind and rain by balanced windows have been retained throughout the entire length of the car with the exception of the entrance openings which are fitted with special blinds.

The electric lighting on the "P" type car is on a more liberal scale than that provided on the older types; the lamp fittings have been partially sunk in the roof lining and fitted with shades which retain a greater portion of the light within the car and also protect the passengers' eyes from glare. The seat contour has been modified from the previous standard as the result of a series of tests, the contour finally adopted being one which was adopted by the New York Municipal Railway.

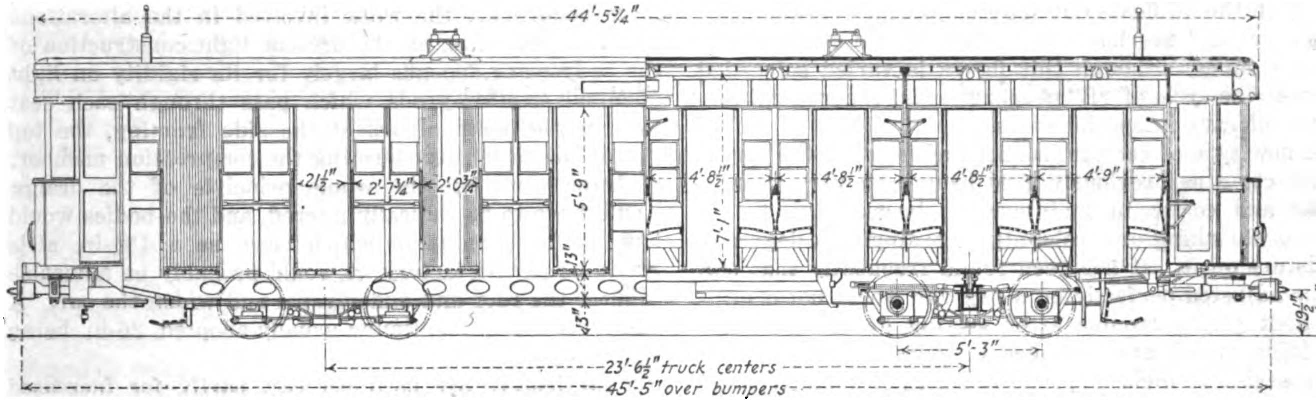
In place of the usual hanging straps for the use of standing passengers, stout handrails have been provided, running from side to side of the car, and of sufficient strength to give passengers ample support in every direction. Special attention has been given to the reduction of noise, and as far as possible loose parts have been eliminated or arranged to cushion against rubber stops.

The end destination boxes have been formed in the car framing at the end of the roof, and these will be clearly visible on cars moving through crowded thoroughfares, whereas the older types, which were mounted at the waist-rail level, could not be seen by a person standing in a crowd while at night they were more or less obscured by the glare from the headlight. Both side and end destination boxes will be illuminated at night, and the destination signs can be changed by operating hand wheels placed in convenient positions inside the car.

The trucks have been specially designed with a view to securing an easy riding car, and in this respect it is anticipated that the results attained will be an improvement on any of the existing stock. The maximum amount of seating accommodation which is possible in a car of this size has been provided in preference to reducing the seating space in favor of standing room.

THE REDUCTION OF CONSTRUCTION AND MAINTENANCE COSTS

Special consideration has been given towards obtaining a design which would readily lend itself to cheap construction and maintenance, and to this end it has been decided to use electric welding wherever practicable, it being lower in first cost than other methods, while its use reduces the number of separate parts to such an extent that there are comparatively few portions which can develop trouble by working loose. Moreover, it permits of lighter construction generally owing to the increased areas required by rivets and bolts.



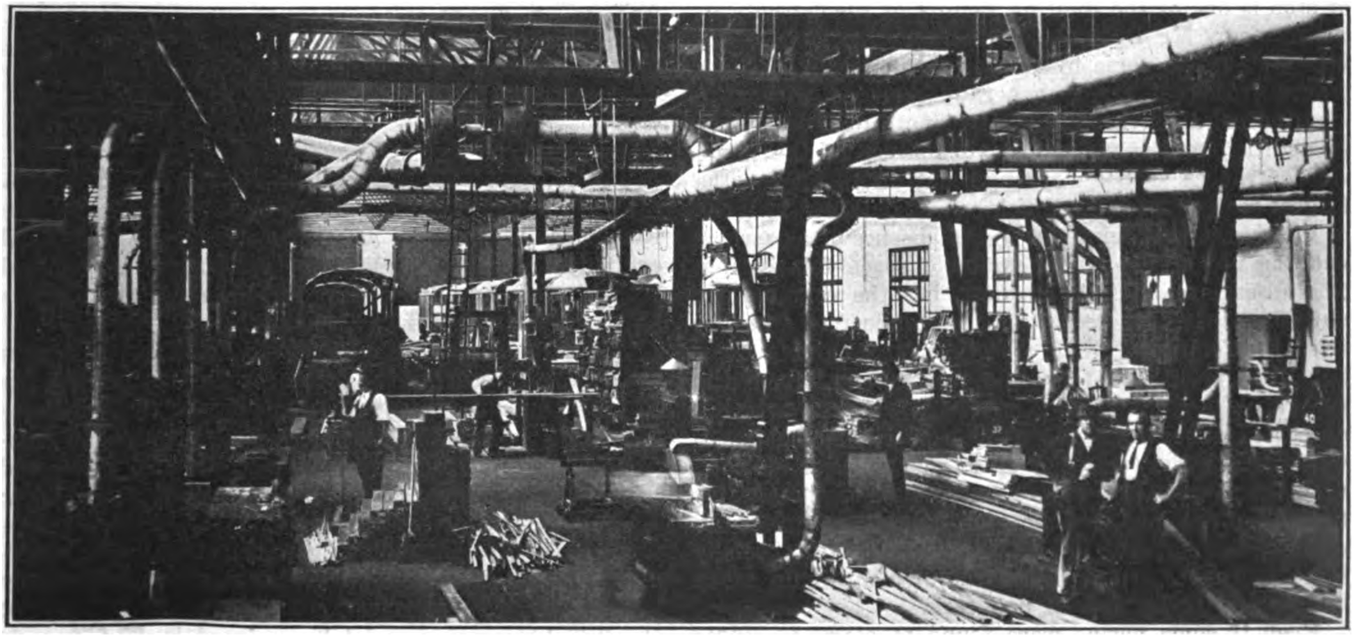
HALF SIDE ELEVATION AND HALF LONGITUDINAL SECTION OF TYPE "P" CAR, SYDNEY

Regarding the decision to use electric welding it may be of interest to mention that early in 1918 a pair of trucks were manufactured by this method, and were put into the heaviest service available. They have been in continuous operation ever since, excepting for the time required for regulation overhauls, and have now completed a service of over 42,000 miles. During this period the general operation has been entirely satisfactory, no weakness has developed, and with the exception of the usual attention to the ordinary wearing parts the maintenance costs have been nil. Electric welding has been very extensively used in effecting the tramway rolling-stock repairs during the last five years, as a result of which its use has now been decided upon for practically all work of this class. It is recognized, however, as a result of the experience gained, that the work must be specially designed to give the necessary flexibility for the successful use of this medium.

BODY FRAMING

To expedite production and facilitate repairs the body framing has been designed in such a way that whole quarters can be assembled and finished at the workmen's benches, after which they can be erected on the car as completed units. The roofs also are built on a suitable trestle framework which supports the work at the height best suited to the convenience of the car builders when they are standing on the workshop floor. When finished, the roof can be lifted into place, complete in all respects, the cables and fittings being already secured in position. No bent woodwork is used in the roof framing, the whole of the special shaped timbers being bandsaw work. The ends of the roof are not shaped in the usual way, the longitudinal contour being straight from end to end of the car, thus avoiding the necessity for specially tapering and fitting the boards when forming the ends of the roof. The seats are treated on somewhat similar lines, the battens being fitted into cast aluminum shapes, and assembled at the bench. All work is being made to gage or template, and will be strictly interchangeable with other similar parts, thus greatly facilitating repairs.

Special attention has been given to providing all wearing surfaces, where possible, with easily replaceable hardened steel liners, and an endeavor has been made to secure a life of wearing parts, and parts needing adjustment, which will carry the car over the average mileage between minor or "B" overhauls. The period between these overhauls is governed by the life of the wheel flanges, which averages 10,970 miles, and the axle boxes have been designed with a view to attaining this mileage, with a reasonable margin, without reoiling or other attention. This necessitated precautions being taken to keep water and dust out of the axle boxes, the former being a source of much trouble in tramway work where it is not uncommon for the water, picked up by the wheels in wet weather, to find its way into the reservoir in large quantities, as a consequence



PORTION OF WOODWORKING SHOP AT RANDWICK—SEVERAL CARS IN COURSE OF CONSTRUCTION IN BACKGROUND of which the oil floats out and dry journals result. The main, or "A," overhauls take place at the end of every 100,000 miles, although this figure is varied somewhat to meet the cycle of "B" overhauls, and the general condition of cars in special cases.

A new type of curtain has been adopted, as the spring roller curtains previously used have been very troublesome and costly in maintenance, largely due to the canvas shrinking or stretching according to a degree of moisture on it. It has been found frequently that curtains adjusted perfectly on a fine day would not operate without giving trouble after getting damp. The new curtains, which are arranged in pairs, are constructed as a series of folds or pleats attached to frames, which operate on the same principle as roller-sliding doors. In this arrangement ample allowance is made for the shrinkage of the canvas, and when not in use the curtains automatically fold away into space provided.

Care has been taken to avoid placing on the floor any unnecessary obstructions which may tend to collect dirt, and all fittings about the car have been left as plain and simple as possible to facilitate the car-cleaners' work; wider floor slats have been used with a view to increasing their life and reducing the work of sweeping between them. Spaces which would tend to hold water or dampness have been carefully avoided either by sealing the space altogether or by leaving ample room for air currents to pass through.

CONDITIONS AFFECTING RAPID LOADING AND UNLOADING

The arrangement of the seats and entrances on the "P" type car is in accordance with the department's standard practice, which dates back to the days of the original steam service. The car is divided into a number of small compartments, each 4 ft. 8½ in. wide, with a seat on each side extending the full width of the car, each seat providing accommodation for five passengers. Each compartment has an entrance from either side of the car, and this feature permits of a very rapid rate of loading and unloading, a continuous step being provided from end to end on each side of the car, both steps always being available when the car is in service.

This arrangement of entrances has proved most satisfactory during rush-hour traffic when the cars are being operated under minimum headway, and the length of stop is one of the limiting factors of the capacity of the service. Mr. Douglas said that no other large tramway system has come to his notice where the side entrance cross-seat car is generally accepted without a longitudinal aisle throughout the length of the car, but in addition to the undoubted advantages of the many side entrances such an arrangement offers by far the largest seating capacity which can be obtained in a car of given size, this being due to the absence of a corridor and the use of the whole available space for seating. The absence of an aisle however, has the very serious objection that it necessitates the conductors working from the footboard when collecting fares, giving them but little protection from the weather and from the general vehicular traffic. The adoption of end-entrance or center-entrance, in the opinion of the management, would reduce the frequency of service which is attained with the present type of car on account of the greater time required for loading and unloading, unless an entirely new type of low-step car body, with specially large entrances, were introduced, which would mean building an entire fleet of new cars.

Even if some means were found to carry on under these conditions, the work involved in the alterations would be immense, as the present light construction of the body work depends largely for its rigidity on light diagonal steel stayrods which pass through each seat back to the main pillars of the side framing, the top rail of the seat backs forming the compression member. If these were cut the whole principle of the design would have to be radically altered, and the bodies would have to be rebuilt, in which case, as a 16½-in. aisle would be unsatisfactory, it would probably be advisable to alter the roof and underframe and widen the car. A 22-in. aisle is the minimum usually adopted, 26-in. being better.

Four motors are used per car, partly for increased traction and partly to keep the floor low.

PAINTING

For several years the department has used air-drying enamel for painting the tramcar body work, in preference to the previous method of carriage painting and varnishing, which involved the application of no less than fifteen separate coats of paint and varnish, and required twenty-six days for application from start to finish, as compared with a total of six coats and ten days in the case of the enamel.

The applications of air-drying enamel on new work are as follows: Two coats of primer; two coats of surfacer; one coat of flat color; one coat of enamel. The car is well sandpapered after the fourth coat has thoroughly set, and slightly sandpapered after each other coat except the last.

Experience has shown that the results obtained are more permanent and much cheaper than those achieved by the previous methods. All coats applied are of the same tint as the final one scratches, therefore, are less apparent than when different colors are used.

The average life of the enamel is about twenty-two months, after which a further coat of enamel is applied over the old one with entirely satisfactory results, the only preparation required being a wet rubdown with horsehair and powdered pumice.

TABLE III—DETAILED DIMENSIONS OF "P" TYPE CAR

Length over bumpers	45 ft., 5 in.
Width over running-boards	9 ft., 0 in.
Width over body-framing	7 ft., 7 in.
Width over weather rails	8 ft., 0 in.
Height to top of roof	9 ft., 8¼ in.
Height of top of trolley bridge	10 ft., 8 in.
Height of steps—	
Rail to step	1 ft., 3 in.
Step to car floor	1 ft., 1 in.
Height of floor from rail level	2 ft., 4 in.
Wheel base of car	28 ft., 9½ in.
Distance between pivotal centres	23 ft., 6½ in.
Wheel base of trucks	5 ft., 3 in.
Gage	4 ft., 8½ in.
Total weight, including all equipment	15.35 tons.

For the two sample cars now being built in the Randwick Workshops of the system, one electrical equipment will be supplied by the Australian General Electric Company and one by the Metropolitan Vickers Electrical Manufacturing Company.

The Australian General Electric Company has been successful in securing the order for the equipments for for the next installment of twenty-five cars, and these will be of the following type: G. E.-247A motors, complete, 59-14 gear ratio, with "B" grade solid gears and "M" grade pinions; P. C. 5E 1 motor controllers; C. J. 129A master controllers; C. P. 27B air compressors; M. L. type compressor governors; S. F. 10 motorman's valves; U. S. 13D trolley bases, and all necessary switches, reservoirs, valves, etc. The estimated cost of the "P" type cars completely equipped is £3,650 each.

Swedish Railways Increase Use of Diesel Electrics

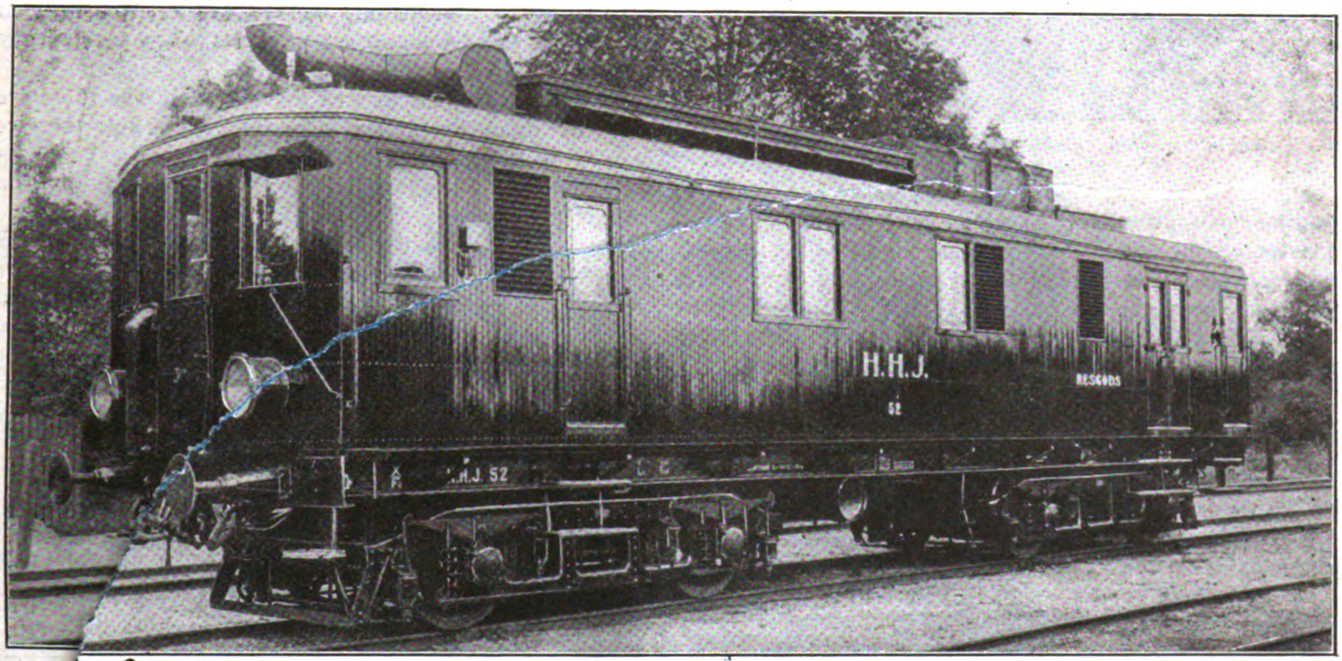
Success of Small Motor Cars Leads to Introduction of Those With 160 and 250-Hp. Capacity—Reduction in Operating Cost and Improved Service Among Results Achieved

IN SPARSELY populated districts and in countries where the railway mileage per inhabitant is high, so that the traffic is light, there must necessarily be a keen demand for light passenger equipment. This demand is being satisfied in Sweden, where the railway mileage per inhabitant is said to be greater than in any other European country, by the use of motor cars with Diesel engines and electric transmission to the driving wheels.

The motor cars described below are manufactured by the Diesel-Elektriska Vaghn-Aktiebolaget, of Vasteras, Sweden. The smaller sizes, rated at 75 and 120 hp., have been in use on seven different lines, some since 1913. Last summer some of the same lines that have used these smaller sizes put into operation motor cars of 160-hp. and 250-hp. capacity. At present four of the large units are in regular service on three lines in southwest Sweden connecting Halmstad, Smalandsstener and Nässjö, Helsingborg and Hessleholm, and other cities to the south of Gothenburg.

The 75-hp. car is designed to carry passengers as well as baggage, while the larger cars have baggage compartments only, the passengers being carried in trailers. The standard-gage 75-hp. car has two third-class compartments with seating accommodations for forty-one passengers, and a second-class compartment for ten passengers. Seats in the third-class compartments are of varnished pine, while those in the second-class have removable cushions and backs.

Hand-operated and automatic air pressure brakes can be controlled from each end of the car. All cars can be driven from either end so that no turntable is required. During the winter the car is heated by cooling water from the Diesel engine, this being led through radiators or pipes under the seats. Electric lights are provided and can be connected to the trail cars.



EXTERIOR OF 250-HP. RAIL CAR. EXHAUST PIPE AND RADIATOR FOR COOLING WATER SHOWN ON ROOF OF CAR

POWER EQUIPMENT

The complete power installation for the motor car consists of the following apparatus, which is similar for the different sizes:

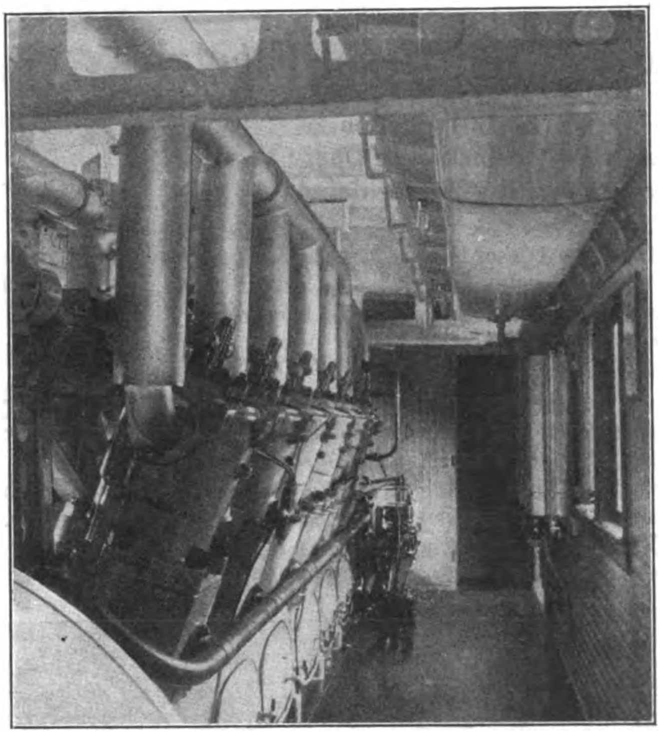
One Diesel engine of the four-stroke cycle type, with six, eight or twelve cylinders, according to the capacity. The size of generators and other electrical equipment is also increased with the engine capacity.

One direct-coupled, direct-current generator of the eight-pole type, with commutating poles. The generator is shunt wound, but has a separate series winding, the latter being connected to the circuit only when the generator is driven from the storage battery in starting. The generator voltage can be varied within wide limits up to 550 volts.

Two electric motors of standard series-wound railway type, with commutating poles. Power is transmitted to the axles by spur gearing.

One storage battery of the alkaline Jungner type. This is suspended beneath the car and supplies current for starting, lighting and working auxiliary apparatus. It is charged automatically while the car is in motion, and a special switch is provided for charging when the car is standing.

The driver starts the Diesel engine by the controller at either end of the car, the engine requiring no attention while in operation. The lubrication and fuel feed are automatic, and the driver can check the operation by inspection of gages and meters in his cab. Thus no



TWELVE-CYLINDER DIESEL ENGINE (250 HP.) USED ON SWEDISH RAIL CARS

engine-room attendant is necessary. The engine is started on the first position of the speed control drum, and movement of its handle to the second and third positions connects the motors, bringing the car up to speed. To stop the car it is necessary only to let go the safety button. If anything happens to the driver, the button is released so that the engine stops and the car comes to a standstill.

The general construction and performance of these cars are indicated in the accompanying tables. The performance is for motor cars traveling at a fair average speed and hauling trailers with a weight per passenger comparable to the light passenger car used in Sweden. The performance of the 250-hp. car on grades is indicated in the chart.

The layout of the two large cars is shown in the accompanying drawing. The 160-hp. car has a spacious engine room, situated in the center, and baggage and postal compartments. For the 250-hp. car, however, the engine is placed in a compartment at one end, as shown in the illustration. The larger car differs also in that it runs on two four-wheel bogies, that under the engine room being of the trailer type, while the other is a motor bogie containing two driving motors. This car also contains an engine room and a baggage compartment.

The motor cars recently delivered contain several improvements that will be incorporated in all future cars. The cooling water for the Diesel engine is recooled in an apparatus consisting of a number of common automobile radiators. These are mounted on the roof of the car as shown in the accompanying picture. A fan blower driven directly from the main engine forces air over these radiators. Thus the cooling is independent of the speed of the car.

A change has also been made in the electrical apparatus so that the propelling motors, ordinarily connected in parallel, can be connected in series when particularly great tractive power is required.

The fuel oil consumptions mentioned in the table are those obtained in practical operation. In regular service it is said, the new 160-hp. motor cars have a fuel consumption of only about 1.77 lb. per mile, with a train weight of 90 tons.

During a demonstration trip of one of the 120-hp. cars, covering 2,180 miles, with a drawbar load of two or three passenger cars, the manufacturer found that the oil consumption averaged only 6 per cent (calculated by weight, as the cost per kilogram of fuel oil and English coal at the time of the trip was the same) of the coal consumption for a corresponding steam locomotive train.

Compared with steam locomotive traffic, the Diesel electric motor car traffic involves a materially lower operating cost, and further a reduction of wages and maintenance cost, the cars being worked by only one-man crews. The exact amount of the savings, of course, depends upon local conditions.

DIMENSIONS AND WEIGHTS FOR DIESEL-ELECTRIC CARS USED ON SWEDISH RAILWAYS

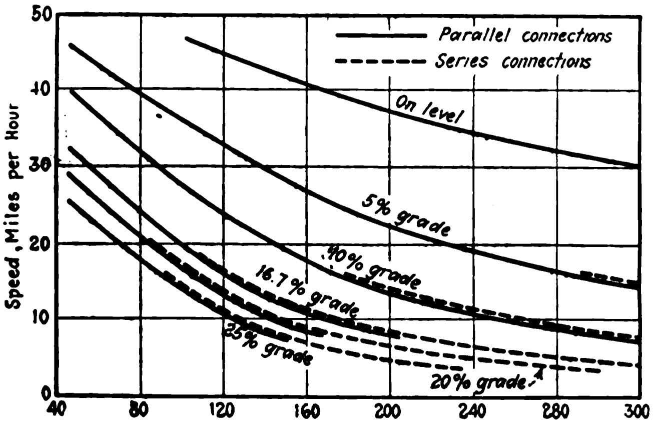
PLAN OF 160-HP. CAR. DRIVER'S COMPARTMENT WITH COMPLETE CONTROL EQUIPMENT AT EACH END



Performance Curves for 250-Hp. Diesel-Electric Car on Grades Up to 25 Per Cent

The consumption of lubricating oil does not increase in proportion to the capacity of the Diesel engine. This is also true of the maintenance and repair costs, as the greater part of these items represent cost for dismantling and assembling the machinery and the car during the general overhauling. The Swedish cars as a rule are overhauled after running about 40,000 miles, although it is said that railway engineers favor 60,000 miles.

In calculating the depreciation costs of the car, it is estimated that the "length of life" of the machinery is fifteen years, and of the car twenty-five years, which results in an average of about twenty years for the complete motor car. Experience of more than eight years of service is said to justify this consumption.

PERFORMANCE OF DIESEL-ELECTRIC RAIL CARS ON SWEDISH RAILWAYS*

Hp.	Passenger Seating Capacity	Train Weight, Short Tons	Fuel Oil Consumption, Pounds per Train Mile
75	100	55.1	1.42
120	150	88.1	1.95
160	225	115.7	2.48
250	375	181.9	3.55

*Based on fair average speed, with maximum grade of 1 per cent.

One railway company is reported as having run one of the Diesel cars for fifty and more consecutive days, as the slight attention and repairs during this time did not necessitate taking the car out of service. This is put forth as an explanation of the saving in maintenance as compared with the steam locomotive, which must be taken out of service for repair more often.

In addition to the saving in operating costs, other advantages cited for the Diesel-electric motor cars are the saving in car heating from the engine cooling water, the independence of cooling and charging stations, and the elimination of waste of time in taking on water and fuel at stations, as the oil fuel suffices for a run of from 370 to 620 miles, and no cooling water is lost or evaporated.

A Twenty-six-Year-Old Subway

Features of the Budapest Line Are the Shallowness and in Consequence the Cheapness of Its Construction

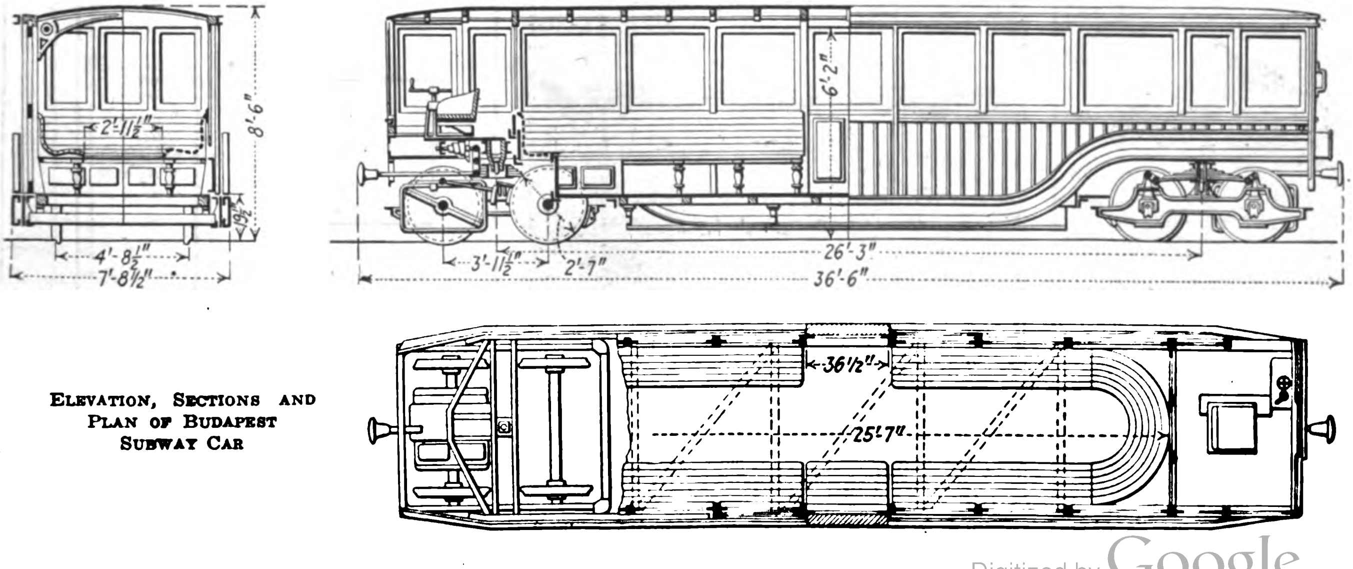
On May 2 the Budapest subway was twenty-six years old, operation having been started on May 2, 1896. It was one of the first, if not the first, electric railway in the world to be operated completely underground. It is a standard-gage double-track line, laid close under the pavement and 3.7 km. (2.3 miles) in length of route. For the greater part of the distance the road extends under Andrassy Strasse. Stations are located an average of 1,230 ft. apart. At the outer end of the line the road comes to the surface within the city park. Some particulars of its construction are given in a recent issue of *Elektrische Kraftbetriebe und Bahnen.*

Every effort was made in the construction of this subway to keep it as shallow as possible, both to reduce cost of excavation and also to avoid relocation of the main water supply system of the city. In consequence, the cars are only 2.6 meters (8 ft. 6 in.) from top of roof to head of rail and the head of the rail is only one meter (39.4 in.) above the bottom of the excavation in which the subway was constructed.

Twenty cars, each equipped with two motors, supply the service. These cars have longitudinal seats and a capacity of twenty-six seated and fourteen standing passengers. The chief feature of their construction is the ingenious way in which the over-all height has been kept down.

The entrance is in the center, and the inside wheels (800 mm. or 31½ in. in diameter) swing to some extent under the seats so that the floor of the car is only 500 mm. (19½ in.) above the head of the rail.

The overhead system is used. The trolley voltage is 300, with double overhead sliding contact, and about 1,000,000 car-kilometers (620,000 car-miles) by the road are operated each year.



Elevation, Sections and Plan of Budapest Subway Car

Car-Stop Posts Used for Advertising on Berlin Tramway

AN ACCOUNT was published in the issue of this paper for Nov. 5, 1921, of various types of car-stop posts of a design to carry advertising being tried by the Berlin Municial Railway. Since that time the designs have been generally standardized to the four-sided stop indicator, illustrated in the accompanying engraving. This car-stop sign is square in cross-section, with an iron base 21 in. square and 20 in. high, and two display spaces above on each side, being 14½ in. wide and with an aggregate height of 87 in. There is also a space about 9 in. high and 17 in. wide at the top on each side. The total height of the stop sign is 10 ft. 10 in.

One space on the side facing the sidewalk is reserved for a time-table of the cars passing that point. An enlarged view of this time-table is also published. This sign states that this is a stopping point for all of the cars of the following lines, the lines being indicated by the route numerals, 1, 6, 7, etc., as shown on dash signs on the cars. Underneath these numbers is a list of the routes of each line and terminal points with the passing time of the cars, such as "Week days; first car, 6:39 a.m.; last car, 12:49 p.m.; Sundays; first car, 7:45 a.m.; last car, 12:21 p.m." In the lower corner are given the addresses of the nearest fire station, hospital and emergency station, police headquarters, and branch post office.

The data in the time-table, as well as the advertisements, are printed on opaque paper and pasted onto the inside of the glass. At night, the post is illuminated from the inside so that the time-tables and advertisements can be read.

The Berlin Street Railway has recently issued a new style of ticket, well engraved and of a convenient pocket size so that it can be used for currency, and possibly this was the purpose. On one side the ticket reads that it is valid on the Berlin Street Railway until revoked by a notice in the city publications. The reason for this provision is that owing to the fluctuating rate of exchange the price of tickets varies, usually going up. Thus, in April of this year, the fare without transfer had increased to 3 marks and the fare with a transfer cost 5 marks, and there was a report that the prices would soon be 4 marks and 7 marks respectively. The reverse side of these tickets shows a historical scene in street transportation, such as one of the early horse cars or an original motor taxicab.

Gasoline Car Hauls Mixed Train

THE Oil Fields Short Line Railroad has installed an F. W. D. rail car in place of the steam locomotive which was formerly operated over the 8 miles between Dilworth and Clifford, Okla., where the line connects with the St. Louis & San Francisco Railroad.

The rail car has capacity for twenty-four passengers and is equipped with M. C. B. couplers front and rear. To haul freight, a box car or flat car can be coupled on during one of the regular passenger runs.

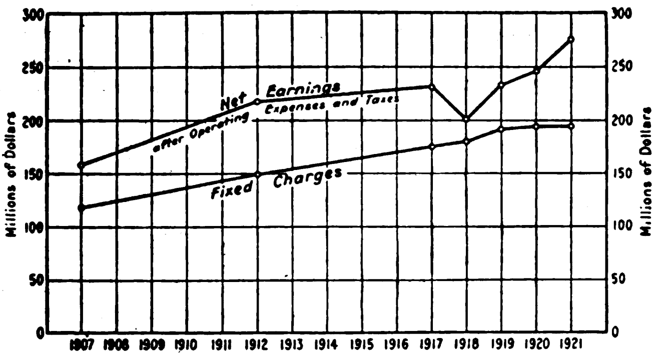
Railway Finances Improving

Analysis by Bonbright & Company with Charts Gives Six Reasons for Better Conditions

A GREAT deal of interest was created about four weeks ago by a statement issued by Bonbright & Company, Inc., investment bankers, New York, on electric railway securities. This statement was published as an advertisement in the *Electric Railway Journal* for July 8 and in several of the leading daily papers during the first part of July. It was headed "Street Railway Securities" and read as follows:

> The first electric street railways in this country were built between 1880 and 1890. By 1900 they represented an investment of $2,000,000,000. Prior to 1914 their mortgage bonds were highly regarded as investments and generally sold at higher prices than comparable securities of electric light and power companies.
>
> The general level of commodity prices and wages rose steadily from 1896 to 1920, greatly accelerated by the outbreak of the War in 1914 and by the participation of the United States in 1917. In general, increasing operating expenses had largely offset gains in the gross earnings of street railways by 1912 and the five year period 1915-1920 was one of unusual hardship to many traction properties, so that there has been a strong prejudice against their securities in recent years.



NET EARNINGS AND FIXED CHARGES OF THE ELECTRIC RAILWAY INDUSTRY

1907, 1912, 1917—From U. S. census reports; subsequent years—Figures furnished by American Electric Railway Association based on reports of its member companies.

Note—Net earnings include net revenue from railway operations, net revenue from auxiliary operations, and other income; net earnings are after deduction of all operating expenses, including maintenance and depreciation, and taxes; fixed charges include interest on funded and unfunded debt, rentals, amortization of debt discount, etc.

> After careful analysis of the present situation, we believe that these difficulties have been overcome with respect to the street railway situation as a whole throughout the United States and that the outlook is decidedly favorable for well managed and conservatively capitalized companies. We believe that within two or three years the investment securities of such companies will have regained much of their former standing.

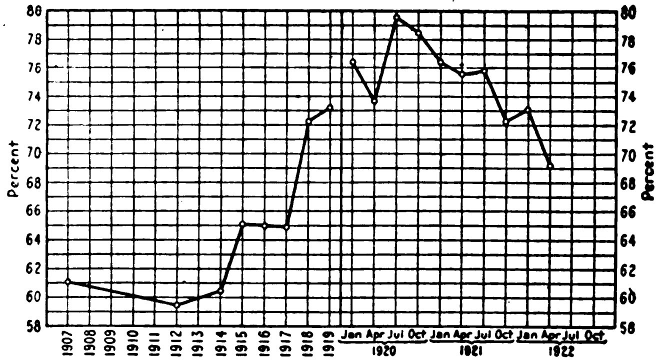
EVIDENCES OF IMPROVED CONDITIONS CITED

This week the same banking organization has issued a statement giving further particulars of its analysis of the electric railway financial situation. From this statement the following particulars are taken:

The present condition and future possibilities of the street railway companies of the country are influenced by such a variety of factors that there are marked differences in the positions of various groups of companies. For example, independent companies in communities of medium size, where public relations have been good, have been quite uniformly successful during the past year. Likewise, there have been but few defaults in the issues of street railway subsidiaries of large electric power and light groups. On the other hand, independent companies in large cities where traffic and political problems have been acute, present so many individual problems that the probable future must be considered separately in each case.

However, though the record and outlook of any individual company must be considered as a problem by itself, statistics of the electric railway industry for 1921, as compiled by the American Electric Railway Association, and evidences of improving conditions during the current year, show that the industry as a whole has definitely turned the corner and is gradually recovering from the difficulties brought about by the period of greatly increased prices and wages.

The accompanying chart shows that net earnings in 1921 not only were greater than in any previous year but that they exceeded fixed charges by a greater percentage than in any other year shown on the chart, with the exception of 1912. As shown in the second chart the operating ratio of eighty-one companies was 69.5 per cent for April, 1922, a decline of 13.5 per cent of the July, 1920, figure of 79.6 per cent. The annual average operating ratio of the industry rose to a peak of 74.8 per cent for 1920 and then declined to 72.2 per cent for 1921. (These last two figures are not shown on the chart.) The foregoing charts indicate that a continuously lessening proportion of the gross earnings is being absorbed by operating expenses and that the net earnings remaining are increasing more rapidly than are the fixed charges. Increases in gross earnings, due to the gradual revival of business activity, should add materially to the margin of safety of net earnings over fixed charges.



THE RATIO OF RAILWAY OPERATING EXPENSES TO RAILWAY OPERATING INCOME

1907, 1912, 1917—From U. S. census reports; other years—Figures furnished by American Electric Railway Association based on reports of its member companies.

Further evidence of the improving financial condition of street railways is shown by the fact that the number of receiverships (sixteen)* in 1921 was, except for 1914 and 1916, less than any year since 1910. During the first six months of 1922 there were only four* receiverships.

A recent investigation made by the *Electric Railway Journal* shows that from Jan. 1, 1922, to June 15, 1922, orders were placed by electric railway companies for 1,016 new cars, which exceeds the entire number purchased during 1921 by 122. That the financial conditions of the electric railway industry warrant such substantial increases in orders for new equipment is evidence that a considerable improvement is in progress.

REASONS FOR IMPROVING CONDITIONS

An analysis shows that there are several fundamental reasons for the improving conditions of street railways: (1) reduction of material costs, (2) reduction of labor costs, (3) increased fares, (4) the partial elimination of uncontrolled "jitney" and bus competition, (5) marked economies of operation, (6) improvement in public relations.

---

*Figures furnished by American Electric Railway Association.

(1) *Reduction of Material Costs:* Several interesting cost indexes, compiled by Albert S. Richey, were published in the *Electric Railway Journal* of June 24, 1922. The index of the cost of street railway operating materials, which is based on 1913 average as 100, rose to a peak of 247 in September, 1920. Since that time it has fallen rapidly and at present it is between 156 and 159.

(2) *Reduction of Labor Costs:* A similar index of street railway labor costs rose to a peak of 232 in September, 1921. From this point it has now declined about 8 per cent to 213.

(3) *Increased Fares:* Mr. Richey's index of street railway fares shows that the average in 1913 was 4.84 cents. Only very slight increases show in this index prior to May, 1918, when a fairly uniform rise started, reaching its high point of 7.24 cents in May, 1921. Since that time there has been a decline to about 7.14 cents at present.

(4) *The Partial Elimination of Uncontrolled Jitney and Bus Competition:* While in many communities the operation of jitneys and auto buses, subject to little or no regulation, is still a serious menace to the street railways with which they compete, there is a growing tendency on the part of regulating bodies to realize that such jitneys and auto buses, as public carriers, should be subject to regulation in the same manner as street railways. The laws of twenty-three states now provide for regulation of motor vehicles when used as common carriers. The jitney situation is on the whole far better than at any time for several years.

(5) *Marked Economies of Operation:* While the increase of net earnings has been largely due to decreases in the cost of materials, labor and fuel, rigid economies have played no small part in the reduction of operating expenses. The introduction of one-man cars, automatic substations and other labor saving equipment, and the abandonment of unprofitable and unused trackage, are illustrative of the tendency of efficient management to keep operating expenses at a minimum.

(6) *Improvement in Public Relations:* The public is coming more and more to realize that street railways are essential utilities and that their prosperity is necessary to the general development of the communities in which they are situated. Both court decisions and public opinion have definitely established the fact that essential utilities are entitled to fair returns.

There Are Still Some Left

Letters to the Editors

Present Status of Rail Standardization

PUBLIC SERVICE RAILWAY COMPANY
NEWARK, N. J., July 25, 1922.

To the Editors:

I have read with considerable interest the editorial in your issue of July 15 on "The Present Status of Rail Standardization," particularly your plea for a more extensive adoption of existing standards which have met the test of actual service over a period of years. Where conditions will permit, the economic advantages of such a course should be evident to every one, especially to the smaller companies whose individual requirements in any one line are comparatively small. And even in the case of the larger properties the developments of new standards such as rail sections, where the expense of constructing new rolls is high, should not be undertaken without a careful survey of every condition involved.

The cost of an entire set of rolls for a new grooved girder section will probably be in the neighborhood of $8,000, although it sometimes happens that, as was true in the case of the new Cleveland 7¼-in. T-rail, roughing rolls for existing sections (in this case L.S. 87-399) are suitable for use with the new section, thus somewhat reducing the expense of producing the latter. In your editorial you have assumed a distribution of the cost of the rolls over 6,000 tons, or $1 per ton. This is probably giving the railway companies the benefit of the doubt to a considerable extent. It would be interesting to know, for example, how many rolls have been produced by the rail manufacturers which have turned out more than 1,000 tons, which is the amount of the first rolling for the new San Francisco rail, and there are probably a number that have not turned out more than half this amount. No matter whether the cost is borne by the purchaser or is absorbed by the manufacturer in his general manufacturing costs, the electric railway industry as a whole pays the bill. As long as the manufacturer is willing to assume the cost of rolls for new sections, just so long will we continue to find engineers insisting on having their own ideas as to rail design carried out, even though in many cases the differences between the latter and some one or more of the 500 existing varieties are so slight as to be practically negligible.

On the other hand, as you have stated, along with standardization must go experimentation. What is standard today may become obsolete tomorrow and there will probably never be a "one best" product or design of any kind for all conditions. Local considerations must govern. In the case of the Cleveland rail, for example, the preponderance of 2¾-in. wheel treads on some trackage was resulting in unequal wear over the 3-in. head of the old 95-400 section and at the same time a total width of head of 3 in. was considered essential in order to protect the adjoining paving on tracks over which interurban cars with their wider wheel treads were operating. It was also desired to retain the use of the T-rail and, since it was exactly this situation which was responsible for the design of the sloped back heads on girder rails, it was a perfectly logical thing to apply this principle of design to a T-rail. It must have required considerable courage on the part of Mr. Clark to advocate a change in T-rail design involving the long established conventional symmetrical feature. At first glance it may seem a peculiar design, yet a careful study will show that this was a perfectly logical change to make. The curved-head feature, which has been responsible for the change in design of several girder rails in the past few years, and which many engineers consider very desirable, has been incorporated in the new T-rail section. It would not appear unlikely that other companies using high T-rail will recognize the possible advantage of this new design for use in paved streets.

As to the changes in design involved in the new 9-in. grooved girder rail of the Market Street Railway of San Francisco, it is probably true that economic considerations were largely responsible for the failure of this company to adopt the Association standard 9-in. girder rail. The new design weighs 121 lb. per yard as against 134 lb. for the Association standard, a difference of 13 lb. per yard, or nearly 20½ tons per mile, with a saving of approximately $1,030 per mile. The ⅝-in. flange depth in use on the car wheels in San Francisco did not require a rail groove depth as great as that of the Association standard and it was also deemed desirable that the fish plates be interchangeable between the old and new sections.

Criticisms are bound to be heard when changes of this kind are made. Our company was criticised from some sources as having taken a step backward when we recently decided to return to the use of a tram girder rail, after having used L.S. 116-434 and its predecessor L.S. 114-393 since 1907, yet the change offered several advantages. First, we eliminated rail wear due to wheel flanges cutting into the rail lip, with the resulting additional wear on the wheel flanges themselves; second, we reduced the amount of power required to move cars when the rail groove is packed with snow and ice; and, last, but not least, we reduced the weight of rail 15 lb. per yard or 23.6 tons per mile of track, a saving of about $1,190 per mile. This was done without sacrificing any appreciable amount of metal in the head, introducing the curved head feature, without materially changing the position of the center of bearing with respect to the center of the web, and also retaining the beveled head feature and the same width of base.

While it is very desirable that our association or other existing standards be utilized wherever possible, it is considerations such as these that will probably always continue to govern in problems such as confronted the engineers in Cleveland and San Francisco.

HOWARD H. GEORGE,
Engineer of Maintenance of Way.

Rail Corrugation on Steam Roads

ROBERT W. HUNT & COMPANY, ENGINEERS
CHICAGO, ILL., July 19, 1922.

To the Editors:

Electric railway engineers who have fought corrugated (or roaring) rail and regarded it as apparently one of the evils of electric operation perhaps will find solace in knowing that a very bad case of it also exists on a single track-road used exclusively for steam operation. A recent trip took me over some forty miles of 85-lb. A. S. C. E. section and 90-lb. A. R. A. "A" section of open-hearth steel rail that was very badly corrugated. The former was laid in 1912 and the latter in 1916, and the corrugations are reported to have commenced to develop within a few months after the rail was laid. As a result of careful inspection I can say unqualifiedly that neither train operation nor track conditions has apparently had the slightest effect on the development. The corrugations seemingly occur under all conditions of speed, steaming and braking; on curved as well as tangent track; on rock and gravel-ballasted track, and on bridges and trestles.

The occurrence is really remarkable and is being carefully investigated. In the meanwhile, I should greatly appreciate the benefit of any new facts pertaining to corrugation that your readers may have.

C. W. GENNET, JR.

Application of Resistance in Railway Automatic Substations

GENERAL ELECTRIC COMPANY
SCHENECTADY, N. Y., July 29, 1922.

To the Editors:

The discussion of the use of resistance in connection with automatic station control equipments on railway service brings up the question of how far experience has indicated the service considerations which dictate the application of resistance in railway automatic substations. The letters from operators given in the issue of June 24 indicate the wide diversity of opinions as dictated by varying conditions of service. Owing to the fact, however, that every operator answers the question with reference to his own conditions of service, there is no actual disagreement. The fundamental reasons for the variations in practice might well be outlined for the assistance of those not yet experienced in the application of automatic substations.

It should be recognized that a wide variation of protection for direct-current circuits is available and each type has been developed in order to meet certain specific requirements. At one extreme we find the use of three steps of resistance in a machine circuit with a total over-all ohmic value such as to limit the machine output in the event of a short circuit on the bus to the commutating guarantee. At the other extreme we find absolutely no resistance, but simply the application of a high-speed breaker which interrupts service entirely until certain definite conditions have been established. In order to give an indication of the general method of preparing recommendations for machine and feeder protection, the following classification has been prepared:

SYNCHRONOUS CONVERTER PROTECTION

Without Feeders

I. Three steps of resistance.
II. No resistance.

With Feeders

III. Two steps of resistance.
IV. One step of resistance and drooping characteristic.
V. No resistance.

FEEDER PROTECTION

A. One step of load-limiting resistance.
B. No resistance — overload circuit breaker reclosed by feeling out protective equipment for stub or multiple end feed.
C. No resistance—high-speed breaker with discriminating trip features reclosed by feeling out equipment for stub or multiple-end feed.

Different combinations of machine and feeder protection are made up to meet different types of service largely in accordance with load characteristics, some of the characteristics of which we will outline in detail in order to illustrate the method of application.

I. Where no feeders are included the conversion unit is usually one of several connected to an interurban line. The resistance is divided into three steps, such that the short circuiting of any one particular step will not result in an overload such as to trip the short-circuiting contactors and reintroduce the resistance, which would result in chattering of the short-circuiting device. The functions of the resistance are to cushion the machine on to the line if at the time of starting up the trolley voltage is very different from the normal machine voltage. It is also designed to act as commutating protection in the event of short circuit or overload so close to the station that although the safe hot spot temperature might not be exceeded, the commutator and brushes of the machine might be threatened if the load is sustained for an excessive period. This protection is obtained through limiting the heat storage capacity of the resistors. The third function of the resistance is to increase the equivalent machine rating. Where the load is of such concentrating character as to constitute a draft in excess of the commutating limit of the converter, it is necessary to hold the draft on any one particular station down to this limit at least. For instance, where occasional locomotive and train operation is contemplated on an interurban, running high-speed, single-car service a 300-kw. synchronous converter is ample for the service, provided in the event of starting the locomotive close to the station sufficient load-limiting resistance can be introduced automatically to hold the station output to the safe commutating limit of a 300-kw. machine.

II. The load-limiting resistance equipment is a very large factor in the cost of a complete automatic control and is often not required where the connected useful load will not exceed the machine rating in service. In such cases operators have used simple reclosing circuit-breaker schemes which disconnect the machine entirely from the line in the event of non-useful loads such as short circuits.

III. Where feeders are included in the station, the feeder protection should act to prevent a short circuit from reflecting back on to the machine. The function of the feeder circuit breaker will be to limit a disturbance to the particular zone or feeder to which it is connected, so permitting uninterrupted service on the other sections. In such cases it is necessary where the total concentrated load of the system may exceed the rating of the machine in the station to supply machine resistors as in the locomotive case illustrated above. The first step of resistance will constitute merely a very small drop in voltage under normal load conditions in order to permit other conversion units connected to the system to assume part of the loads. This step can only be of small ohmic value, however, in order to prevent chattering conditions outlined above and, therefore, a second step is necessary in case of high overloads or short circuits on any particular feeder where the feeder includes a load-limiting resistance step corresponding to the third or highest step of resistance in the machine circuit as illustrated under I above.

IV. As a substitute for the first step of resistance of low ohmic value, it is possible to use the natural droop of a machine with shunt characteristic since the regulation to 150 per cent load will be equal approximately to the voltage drop in resistance if the first step is inserted at 150 per cent load.

V. Again, in systems where the service is extremely light and does not warrant large expenditure for protective equipment and the ability to sustain overloads afforded by the resistance, protection may be afforded by a circuit breaker arranged to trip only at loads indicating disturbances on the system. This circuit breaker may be fitted with feeling out equipment corresponding to that on the feeders.

A. A step of high resistance for load limiting in each feeder may be used in conjunction with machine equipments outlined in III and IV. In this case the heating capacity of the resistance is such as to overheat the resistance before any damage to the feeder may be anticipated, since the feeder will be disconnected from the load by thermostat at any desired predetermined point. When used in conjunction with machine protection III, the load limiting resistance in the feeder will permit of sustaining useful concentrated loads and delivering maximum current to any load within permissible limits of commutation. At the same time an overload on any one particular feeder will not constitute any interference with service on other feeders running out from the same station which are not overloaded.

Such resistance equipment is particularly applicable where the total over-all trolley and feeder resistance between substations is relatively large, so that a very considerable voltage drop is necessary on any feeder in order to shift the center of gravity of the load toward another feeding point, or obtain any material load limiting. A resistance feeder equipment is not applicable in the city system where the traffic is heavy and the density of population dictates a feeder network such that equivalent resistance between feeding points is very low. In such cases the introduction of a high resistance in a feeder simply results in moving the center of gravity of the load to the other end of the feeder, or the other source of power, and prevents any supply to the load in question.

B. Where the system does not warrant the investment in resistance, or the layout is such that the resistance equipment will not function, a circuit-breaker equipment may be applied. This circuit breaker will act to disconnect the machine from the load and resume service after a feeling out resistance indicates that the external load would not exceed the rating of the feeder if the circuit breaker is reclosed. This constitutes a complete interruption of the service and is not feasible on many systems.

C. On heavy city systems with low resistance between feed points continuity of service is paramount. A few systems, in fact, are opposed to disconnecting the trolley, even under short-circuit conditions, preferring to burn off any disturbances at whatever cost. Other systems do not feel that they are warranted in such procedure, but do insist on sustaining any possible useful loads. A high speed breaker has been developed to meet this service. It is of such cost as to compete with other forms of feeder protection. In view of the high speed feature, it is possible to set the ultimate trip point of the breaker beyond the commutating limits of the machines connected to the bus; that is, without any consideration of the normal feeder rating (it may often be set at ten times normal feeder rating). This breaker contains inherently a tripping feature which permits of discriminating on short feeds, such as city service, between useful inductive loads and pure resistance short circuits. Under such conditions of protection, it is possible to sustain any conceivable concentration of cars on a feeder within limits of safe heating for insulation and soldered joints. At the same time, the high speed trip will prevent any reflection of a disturbance from one feeder to the bus or other connected loads. This high speed breaker after a trip due to short circuit may be reclosed by a number of expedients developed to meet different conditions, such as a feeling out resistor or simple timing device, to reestablish connections after definite intervals.

Types B and C resistors may be applied with machine protective equipments III, IV or V.

The outline and tabulation indicate the different combinations of control possible, giving a range which the large variety of service conditions have indicated as necessary to meet the desires of different operators.

G. HALL ROOSEVELT,
Railway Engineering Department.

Wants Further Information from Mr. Stuck

YOUNGSTOWN MUNICIPAL RAILWAY
YOUNGSTOWN, OHIO, July 25, 1922.

To the Editors:

I have taken a great interest in a letter from W. G. Stuck, on page 138 of *Electric Railway Journal* for July 22, in regard to Ulco Frary Metal, also in the lubrication cost quoted by him of 4.3 cents per thousand car miles. I have given a lot of study and thought to keeping down the cost of the lubrication of our equipment and still keep inside of the safety zone and avoid hot bearings of any kind. But I must admit, low as our cost has been, it is nowhere near the figures given in this letter.

We have at the present time some Ulco metal on test on our property and from all appearance it is doing fine work. It is not so much the metal as the lubrication cost that interests me, and I think it should interest every man who is responsible for the operation of a railway property. If Mr. Stuck can find the time to write up a very detailed letter for the *Journal* and explain just how he accomplished this and just what lubrication he charges to this account, it will be something that every master mechanic and superintendent of equipment will greatly appreciate.

I might say that we are operating close to 350,000 car miles per month. All our cars are equipped with bronze bearings with the exception of a few cars that are on test with solid babbitt axle and journal bearings. We have in our equipment twenty-four Standard safety cars and 111 double truck city cars; which are equipped with Westinghouse-56, Westinghouse-101, G. E.-80, G.E.-216 and G.E.-247 motors. We have been using Tulc for the past two and one-half years to lubricate our cars, and we reduced the cost per thousand car miles from 47.9 cents to 19.5 cents.

A. B. CREELMAN,
Master Mechanic.

Paris Tramways During the War*

All of the Street Railway and Bus Lines in Paris Have Been Taken Over by the Department of the Seine, But Are Operated by a Private Company

BY A. MARIAGE
General Manager Paris Tramway and Omnibus System

THE present tramway system is made up of six companies, which in 1904 were operated under individual franchises.†

These companies were of different sizes and with various kinds of equipment, but were working toward certain standards, and at the time that war broke out were to a large extent reconstructing their systems for electric power along uniform lines.

On Aug. 1, 1914, at 5 p.m. omnibus traffic was suddenly stopped throughout Paris by the military authorities and the next morning 264 buses required in the mobilization movements were traveling toward the frontier. Within the next few days 770 other buses were taken for the same purpose.

As this mobilization was carried out according to a definite and pre-arranged plan, with which the company was familiar, it did not disturb or disrupt the Paris transportation system. Obviously, also, mobilization did not stop the tramway system. In fact, the cars had to furnish more service than formerly, with an organization entirely new and utilizing to a considerable extent female help. The figures in Table I are from the system of the General Omnibus Company, Paris, which company operated not only buses but also the largest tramcar system in Paris.

While this table is carried back to 1913, the first complete year preceding the war, that year can hardly be considered normal because the electrification of the lines had not then been completed. Certain routes were still operating by compressed air or steam, and others were not in operation because they were being rehabilitated. However, based on these figures, it might be said that if there had been no war the following results might have been expected by 1920:

1. The car-kilometers would have amounted to 42,000,000.
2. The gross receipts would have been about 38,000,000 francs, with the receipts per car-kilometer remaining at 0.91 franc.
3. The expenses per car-kilometer, including fixed charges, would certainly have been reduced by the consolidation and rehabilitation under way to a figure less than 0.80 franc (the figure of 1913).

The tramway system would then have had an additional grant of about 4,000,000 francs, a grant intended, under the franchise of 1910, to compensate for the deficit of the omnibus system.

The statistics have also been plotted in graphical form, the figures being reducted to a car-mile and cents basis. Examination of this graph, which gives figures only for the General Omnibus Company, suggests the following:

In 1914 and 1915, on account of the insufficiency of the operating force and consequent reduction in service, the car-miles and the number of passengers decreased, while the number of passengers per car-mile increased about 10 per cent.

In 1916 the car-miles approached those of 1913, without, however, being adequate to the needs of the population. The passengers increased to 25,000,000. There was an increase of about 18 per cent as compared with 1913 in the number of passengers per car-mile, and the expenses per car-mile increased so rapidly as to cause an economic crisis in the affairs of the company or the system. The different companies took the matter up with the authorities and urged an increase in fares, but nothing was done. The consequences soon made themselves felt.

In 1917 and 1918, on the lines of the General Omnibus Company, the number of passengers increased, but the number of car-miles run decreased, with the resulting coefficient of utilization of the equipment some 45 per cent above that in 1913. In the meantime the expenses per car-kilometer reached 1.64 francs.

The tremendous increase in the number of passengers carried per car-mile corresponded to a decrease in the quality of the product. The passengers had to wait a long time before finding a seat. This increase was due to three causes. The first was the insufficient operating force, which compelled the companies to reduce the number of cars. Second, the reduction in service appeared to be one means of decreasing the total expenses of operation which were constantly increasing. Finally, the depreciation of money, which for the companies was equivalent to a reduction of fare, stimulated a tremendous increase in passengers.

---

*Abstract of paper presented at the meeting of the Union des Voies Ferrées d'Intérêt local et des Transports publics automobiles de France, Paris, Oct. 20-23, 1922.

†See article in the *Electric Railway Journal* for July 1, 1922.

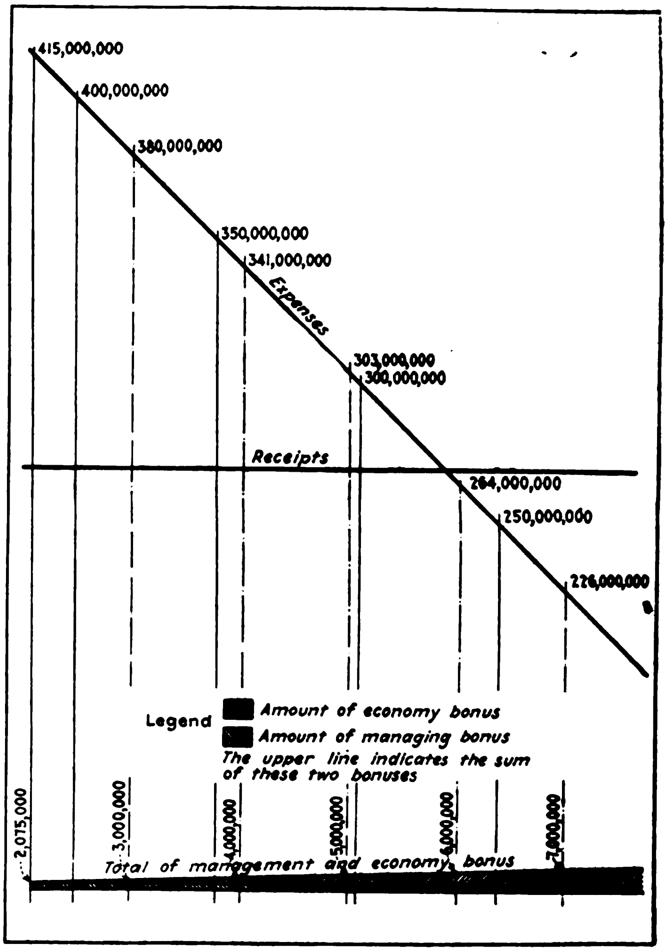
In 1917 negotiations were again opened with the public authorities with the idea of obtaining some compensation so as to help balance the budget, but without result.

By the end of 1918 it was evident that the companies could not continue much longer to remain solvent and in Jan. 22, 1919, a provisional agreement was reached with the city and the Department of the Seine which was to be retroactive to Jan. 1, 1918, and which had for its purpose the establishment of conditions by which the lines could be kept in operation during the war and thereafter until matters could be placed on a more definite basis. This agreement authorized first a slight increase in fare, without which of course operation would have been impossible. This increase in fare went into effect Feb. 8, 1919. A résumé will be given of the financial terms of this agreement, so far as they concern the system of the General Omnibus Company.

A new account, called the administration account, to cover the receipts and expenses of the service was established. In the expenses were included, besides the operating expenses and interest and sinking fund on the debt, a sum of 3,000,000 francs as a reserve for renewals of track and rolling stock and to pay not more than 4 per cent return on the outstanding capital stock. Deficits, if there should be any, after the obligations of the "administration account" are fulfilled, are carried to a reserve account, called "special war reserve fund." If this "special war reserve fund" should contain a deficit at the end of the provisional period, this deficit was to be made up by payment by the city, the amount to be fixed by arbitration. If, on the other hand, this "special war reserve fund" showed a surplus, this surplus would be divided between the city and the company.

Through this arrangement, it was possible to increase the number of car-miles by about 18 per cent during 1919 and 30 per cent (as compared with 1918) in 1920. The number of passengers increased, but not as rapidly as the car-miles, so that the passengers per car-mile began to decrease.

AT RIGHT, DIAGRAM SHOWING RELATION BETWEEN BONUS FOR OPERATION AND GROSS RECEIPTS — PARIS TRANSPORTATION COMPANY



BELOW, DIAGRAM SHOWING STATISTICS OF TRAMWAY SYSTEM OF GENERAL OMNIBUS COMPANY, PARIS

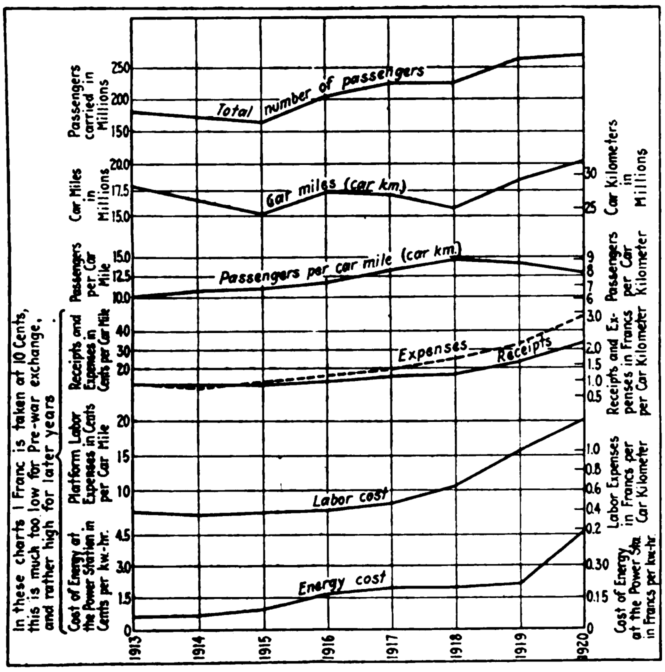


TABLE I—STATISTICS OF THE TRAMWAY SYSTEM OF THE GENERAL OMNIBUS COMPANY, PARIS, FRANCE

	1913	1914	1915	1916	1917	1918	1919	1920
Number of tramcars in service.....	651	604	626	707	707	710	748	788
Car-kilometers in thousands.......	28,835	26,357	24,093	27,728	27,211	25,069	29,694	32,770
Number of passengers in thousands	180,219	174,887	166,453	205,805	226,303	228,245	261,648	263,023
Number of passengers per car-kilometer........................	6.24	6.63	6.90	7.42	8.31	9.12	8.81	8.02
Expenses per car-kilometer, includfixed charges, in francs.........	0.803	0.781	0.958	1.146	1.335	1.641	2.080	2.911
Total receipts in thousands of francs	23,175	21,695	20,527	25,188	27,894	28,425	46,478	70,284
Receipts per car-kilometer in francs	0.821	0.837	0.864	0.919	1.041	1.151	1.581	2.165

It was expected that after the armistice, prices whose increase had so seriously affected the results in 1918 would grow less and that the application of the provisional agreement already mentioned would bring back the system to a comparative degree of normalcy. This did not occur, however. Instead, the expenses increased to a marked degree, so that the total expense per car-kilometer on the General Omnibus system, which were 1.64 francs in 1918, got up to 2.08 in 1919, and finally reached 2.91 francs in 1920.

The graph herewith shows the continuing excess of expenses over receipts of these years, in spite of the fare increase made in April, 1920. The graph also shows the increase in energy costs, measured as high tension in kilowatt-hours at the power station. The principal element in increase in cost was for coal, which rose from 14.875 francs per ton in 1913 to 262 francs in 1920. There were also increases in power station wages, so that the cost per car-kilometer increased from 0.109 franc in 1913 to 0.541 franc in 1920. On the other hand, some saving was possible by more economical operation.

In the meantime wages had also gone up, as shown in tables II and III.

It should be borne in mind in connection with these tables that in 1913 and 1914 the figures represent exclusively man labor for the conductors, whereas during later years there was both male and female labor.

TABLE II—TRANSPORTATION DEPARTMENT. AVERAGE DAILY WAGES IN FRANCS

	Inspectors	Conductors	Motormen
1913.........	7.811	7.039	6.972
1915.........	8.458	6.814	8.614
1917.........	11.788	7.315	11.163
1919.........	17.089	13.507	14.058
1920.........	23.710	20.709	23.993

TABLE III—SHOP DEPARTMENT AVERAGE DAILY WAGES IN FRANCS

	Shop Men on Piece Work	Shop Men on Hourly Work	Carhouse Men
1914.....	.....	9.70	8.20
1915.....	11.90	9.70	8.20
1917.....	19.90	13.40	11.20
1919.....	26.15	22.25	18.75
1920.....	29.05	25.35	22.25

Table IV shows the rates of fare charged. As shown by the main group of graphs, however, the increases as a rule came too late to be of much help.

A few words might be said here in regard to the omnibus system.

As explained in the first part of this article, the service was entirely interrupted in 1914 on account of the requisition of the buses for mobilization. Between 1916 and 1918 the company had about eighty buses in service. Attention is drawn to these figures because otherwise the statistics given, especially when compared with those of 1913, might be misleading.

PRESENT FRANCHISE SIMPLY A LEASE

The situation, as outlined later, could not be continued for any length of time. The temporary arrangement made between the authorities and the companies under the stress of war conditions came to a natural end and the public interest demanded a quick reorganization of the transportation facilities under the best possible conditions.

From the standpoint of economical operation, as well as from that of finances of the companies, there was only one possible solution, namely, the purchase of the concessions of the companies and their merger into one organization for the united transportation of the entire Paris district. This would permit a reduction of general expenses and a simplification of operation. Realizing the impossibility of a continuance of the existing franchises, the representatives of the Seine Department and the City of Paris adopted for the future a policy of municipal ownership and private operation of the roads. Before the advantages of this plan under the existing economic conditions are explained it might be well to review the main features of the system of private ownership and operation under franchises as it existed in France.

Originally, private ownership and operation of a transportation system in Paris under a franchise were economically possible. The owners of the franchise were bound to relatively well defined obligations, their field of operation was restricted, the schedules were definite, and they were not subject to such strict regulation as they are today. Under those conditions it was possible for some enterprises to show a reasonable profit, though it should not be forgotten that others failed to do so. Gradually, however, the interest of investors in these enterprises lessened, and it became continually more difficult for these companies to raise new capital.

Under present conditions the system of private franchises has the following disadvantages: (a) Impossibility of the company to vary the rate of fare according to changes in cost of operation. (b) Difficulty of raising capital, especially for the construction of lines which do not promise an early profit, yet such lines are necessary in every growing community for the convenience of the public. (c) Difficulty in amortizing the cost of installation within the short period for which franchises have been granted, yet neither the city nor the company wishes to be tied up to too long a lease.

These difficulties, always present, were accentuated by the war. Hence attention was given to determine whether an entirely different concession might not be found.

For example, consideration was given to a franchise which called for a guaranteed minimum return with a supplementary return in case of good management. But this did not appear as practicable as one in which the granting power assumed the expenses of the installation and became proprietor of it. The franchise would be given then only for operating the property.

The above discussion suggests the question whether if the municipality owns the property it might just as well operate the lines. Such a plan, however, does not seem suitable to present economic conditions. To insure good management, such an enterprise should be purely non-political, and with commercial characteristics so as to take prompt advantage of opportunities as they present themselves to improve the financial condition of the property. This requires a type of organization quite different from that usual in administering political divisions. The Department of the Seine, realizing these conditions, decided then to adopt the principle of owning the property but farming out the operation.

Under this system, as under direct municipal ownership, the granting power is sole owner of the property, furnishes all capital required by the first installation and for repairs, and it reserves entire control of new lines and rates.

TABLE IV—FARES ON THE PARIS TRAMWAYS (IN FRANCS)

		Urban Fares		Interurban Fares
		For one Zone or Fraction	For More Than One Zone	per Kilometer
Before Feb. 8, 1919....................	First class	0.15	0.20	0.055 (approximate)*
	Second class	0.10	0.15	0.033 (approximate)*
From Feb. 8, 1919 (first class increase)..	First class	0.20	0.30	0.07 (with minimum of 0.15)
To Feb. 1, 1920 (second class increase)..	Second class	0.15	0.20	0.05 (with minimum of 0.10)
Since April 1, 1920....................	First class	0.35	0.50	0.11 (with minimum of 0.20)
	Second class	0.25	0.35	0.08 (with minimum of 0.15)

*Fares of General Omnibus Company.

A system of accounts has been started consisting of the following:

Capital account, including interest and amortization of the property of the former operating companies and for the cancellation of special war expenses, and interest and sinking fund payments for the amortization of loans contracted by the department to take over the installation.

Operating account, including all direct and indirect receipts from the operation of the lines or from the capital invested in the enterprise, including the interest on the guarantee and the legal reserve fund; in other words, all expenses resulting from operation with the exception of those included above in capital account and the remuneration of the managers of the company and their assistants and the commissioners of accounts.

An account covering the remuneration of the company. The method by which this is determined will now be described.

It would have been useless to give the company a share in the profits, because there are none and will not be for at least a number of years if the existing rates of fare are continued. The plan allows the company, therefore, the following:

1. Six per cent on all invested capital.
2. A reward for management, calculated at 0.75 per cent of the receipts from all sources resulting from the operation of the lines (excluding the proceeds from capital invested otherwise than in operation and the interest on company's guarantee fund), up to an amount of 250,000,000 francs receipts, and 1 per cent for all amounts above that sum.
3. A bonus for economy, calculated on a basis of 0.04 (R-0.65 D), where R represents the total receipts from operation and D the total expenditures during the same time, the expenditures including all fixed charges, such as interest and amortization on the purchase sum, the war loans and rehabilitation costs.

From its remuneration the company has to pay its board of directors and operating personnel (manager, heads and assistant heads of departments, etc., a total of not less than forty-five). These individuals receive a definite salary, but also an additional payment proportional to the bonus for economical management received by the company. The responsible heads of the company are, therefore, directly interested in the good functioning of the service and have the same interest in it as has the company.

The other part of the economy bonus mentioned under (3) above is reserved for the capital of the company and is used as a revolving fund for repairs, construction and reconstruction of equipment, for the maintenance of good service conditions. In the writer's opinion the rate of 6 per cent allowed on this sum is insufficient. The return should be proportional to the current rate for money.

In this way the company is constantly pooling its interest with that of the department, and in the end it will be found that the real beneficiary of this co-operation is the Parisian public. In fact, the new company is interested not only in the perfect operation of the merged and reorganized lines but also in building new lines. The accompanying chart shows the relations of the bonuses received by the company to the operating income of the combined lines.

If E is the amount of the economy bonus, then

$E = 0.04\ (R - 0.65\ D)$ and $D = R + p$

where p is the deficit from operation, including the charges on the capital. Then, if D is larger than R:

$$E = 0.04\ [R - 0.65\ (R + p)]$$

or

$$E = 0.014\ R - 0.026\ p$$

If we assume p to be zero; that is, if there is no deficit, we find $E = 0.014\ R$. On the other hand, the reward for management, G, given to the company for receipts in excess of 250,000,000 francs, is found from the formula

$$G = 0.01\ R,$$

from which may be derived

$$E + G = (0.014 + 0.01)\ R$$

$$E + G = 0.024\ R$$

From the above it is evident that any increase of receipts of, say, 1,000,000 francs will increase the remuneration of the company by only 24,000 francs. This is rather a small sum when compared with the results achieved.

The close co-operation between the Seine Department and the company has, however, produced excellent results. There has been a continual increase in car-miles and transported passengers. And the expenses showed a reasonable decrease.

Results of the Consolidation

The decree authorizing new franchise first appeared in the *Journal Official* on Dec. 31, 1920. The company, the Société des Transports en Commun de la Région Parisienne, was organized March 4, 1921, and on March 9 accepted the franchise. On April 8 the company voted to take over also the operation of the boats on the Seine and has increased the service from two to eight boats.

The system now includes the following:

Forty-five buildings used as shops, carhouses or garages, with a floor area of 465,000 sq.m.

Sixteen substations, with a capacity of 34,500 kva.; 1,762 motor cars, 832 trail cars and 1,050 buses.

Of this rolling stock about 82 per cent of the tramcars and 88 per cent of the motor buses are in daily service and make about 340,000 vehicle-kilometers a day and transport daily 2,500,000 passengers.

The tramway system has a length, measured at single track, of 960 km. and the omnibuses 256 km. of routes. The average daily receipts are about 800,000 francs, and the maximum receipts for one day have already exceeded 1,000,000 francs. There are 26,000 employees. There are sixty-three boats, of which eight are in actual service.

The company has laid out a program of construction which during 1921 will aggregate a cost of 100,000,000 francs. At present 20 km. of track has been completely rehabilitated and 8 km. more is under reconstruction; 25 km. of overhead feeders have been replaced. Three new types of vehicles are under test. One is a six-wheel motor bus with a capacity for forty-eight passengers, in place of the thirty-eight wheel bus. The second is a light tramway car weighing 20 per cent less than the standard car, which has the same passenger capacity. The third is a trackless trolley.

At first it seemed that the approximate annual receipts of the system would be about 285,000,000 francs under normal conditions, but for 1921, owing to difficulties at the beginning of the year, the receipts will probably not be far from 265,000,000 francs. The deficit will not exceed 75,000,000 francs. It is thought that the consolidation has been able to effect an economy of 35,000,000 francs as compared with previous operation.

New England Club Holds Outing at Newport

IT MAY have been Socretes, or perhaps it was Ty Cobb,—anyhow some well-known philosopher once said: "It isn't so much what you play as how you play it that counts." That probably explains why those New England street railway men hold such successful annual outings. For about three hundred and sixty-four days a year, they spend approximately twenty-four hours per day coaxing street cars up and down the remaining rails in the old New England States. But one day in each successive year, they abandon the street cars to their own devices and foregather at some chosen spot to renew their youth and also their old acquaintances.

Thus it befell that on the last Thursday in July of the year 1922 A.D., there assembled at Newport, R. I., a goodly crew of managers and motormen, purchasing agents and selling agents, in just about every kind of official and unofficial that has anything whatsoever to do with making the trolley cars trolley.

There stands in the public square at Newport, a queer looking round stone structure, known as the Old Stone Mill. Legend connects this piece of masonry with the landing of the Norsemen, several centuries before Columbus shoved off from the sunny shores of Spain to discover the New World. Why they spent their time laboriously rearing this queer monument when there are so many more interesting things to see and do in Newport, no one seems to know. The members of the New England Street Railway Club did nothing so foolish. They came to Newport for a good time. And they had it!

The crowd began to arrive at Newport Beach about ten o'clock in the morning. They came from all over New England. Incredible as it may seem, there is, here and there, a railway man who can still afford to own an automobile, or at least a flivver.

The pre-arranged program consisted entirely of sports, and the most popular sport seemed to be eating. When they weren't eating, most of the delegates and their wives or friends were dancing. However, there were enough athletically inclined present to run off the scheduled sporting events and carry home the prizes. Many really valuable articles were donated by various members as prizes for the different events. The ladies as well as the men were remembered by the committee on arrangements, and many a New England home was blessed with the addition of an electric flat-iron, electric curling iron, silver bureau set, or other vanity dear to the heart of the housewife.

The arrangements had failed to include a baseball game, but Edward Dana, the enthusiastic general manager of the Boston "L" would never permit a New England Street Railway Club outing to go into history without the annual battle of bats between the railway men and the supply men. So two teams were improvised of anyone who could be impressed into service, and historic opponents clashed arms while there beside the sad sea waves the helpless clams buried in the sands below, trembled at the disturbance above. The railway team, captained by Ed Dana, and ably assisted by R. B. Stearns on third base, is reported to have won the historic contest by the score of 10-6. "Charlie" Leonard, Superintendent of Division 1, of the Boston Elevated was umpire, and carping critics claim that this accounts for the result.

Nearly three hundred people sat down to one of the famous Newport Shore Dinners in the big pavilion at Newport Beach, and for nearly an hour the clashing dishes competed with the crashing surf outside; while a seemingly tireless group of instrument players, humorously referred to as musicians, made the rafters ring with jazz. Short speeches of welcome were made by Mayor J. P. Mahoney of Newport, and the Honorable Clark Burdick, Congressman from the First Rhode Island District.

As the shades of evening fell, the party took to the automobiles again. An hour's ride was enjoyed around the famous Cliff Drive. Then the day was done.

The committee in charge of the outing consisted of A. E. Potter, president of the club, Edward A. Brown, H. B. Potter, W. W. Field, Howard F. Fitch, Edward P. Gosling and John W. Belling. Edward H. Wilkinson, was in charge of the athletic events and the awarding of prizes.

Association Convention Dates

Name of Association	Date	Location	Name and Address of Secretary
Central Electric Railway Accountants Association	Aug. 25-26, 1922	Michigan City, Ind.........	L. E. Earlywine, 308, Traction Terminal Bldg., Indianapolis, Ind.
Amer. Inst., Elec. Engineers, Pacific Coast............	Aug. 8-11, 1922	Vancouver, B. C., Canada...	....
Arkansas Utilities Assn.....	Sept., 1922	Hot Springs, Ark...........	R. I. Brown, Little Rock, Ry. & Elec. Co., Little Rock, Ark.
Central Elec. Traffic Ass'n.	Sept. 22-23, 1922	Webster Lake, Ind..........	L. E. Earlywine, Secy., 308 Traction Terminal Bldg., Indianapolis, Ind.
Nat. Assn. Ry. & Utilities Commissioners, Nat. Convention................	Sept. 26-30, 1922	Detroit, Mich.............	Jas. B. Walker, Pelham Manor, N. Y.
Illinois State Elec. Assn....	Sept. 28-30, 1922	French Lick Springs, Ind....	R. V. Prather, 305 Ill., Mine Workers Bldg., Springfield
Colorado Elec. Lt., Pwr. & Ry. Assn., State Convention with Rocky Mountain Division of N. E. L. A.	Sept. 11-13, 1922	Glenwood Springs, Colo....	Miss M. B. Baker, Gas & Elec. Lt. Co., Denver, Colorado
Amalgamated Asso. St. & Elec. Ry. Employees in national convention......	Sept, 1922	Oakland, Cal...............	R. L. Reeves, 260 E. High St., Detroit, Mich.

The Electrical and Industrial Exposition..........	Oct. 7-14, 1922	New York, N. Y............	Arthur Williams, Pres., Irving Place and 15th St., New York City

American Association News

Executive Committee Meets on Lake Erie

THE American Association executive committee held its July meeting on the 28th, aboard the yacht Tillicum, as guests of F. R. Coates, president of the Community Traction Company, Toledo, Ohio. The members appreciated this welcome change for the location of the meeting as one conducive to a more comfortable discussion of business than hot city offices. In holding its midsummer meeting on board the Tillicum the executive committee followed the precedent set last year by the committee on company and associate membership.

A large part of the time of the committee was devoted to a discussion of a report submitted by the trackless transportation committee, but no action was taken pending a further discussion at the August meeting.

In his regular report as executive secretary, J. W. Welsh said that the association is now on a basis of paying all bills as presented. There are, however, unpaid dues in excess of $37,000, which Mr. Welsh is endeavoring to collect before the end of the fiscal year (Oct. 31) when association funds naturally are low.

In reporting for the subjects and meetings committee, C. D. Emmons said that he felt he could predict a successful Past-Presidents' Day as one of the substantial features of the October convention program. Already a large number of past-presidents have signified their willingness to contribute each his four or five minutes of comment on the problems of the day.

A report of the special committee on constitution and by-laws recommended an amendment to the constitution which would require at least nine (in place of the present twelve) meetings of the executive committee each year. The last meeting for the retiring committee and the first for the new would precede and follow the annual convention, respectively; a third would be held at the midyear conference and the other six as set by the executive committee at its first meeting. This seemed to be the average estimate of the desirable number of meetings as disclosed by a mail poll of the members of the present executive committee, including the active officers and past-presidents.

The amendment as proposed and approved by the executive committee for action by the association in October, is as follows:

> Section VI—(d)—The executive committee shall hold nine regular meetings during the association year and such special meetings as may be necessary. Three of these regular meetings of the executive committee shall be held at the time of the meetings of the association, one being held immediately before the annual convention, one immediately after the annual convention and one at the time of the mid-year meeting of the association. The times and places of the remaining regular meetings shall be fixed by the executive committee at its first meeting in the association year.
>
> The special meetings may be called by the president or by any five members of the executive committee. Seven voting members of the executive committee shall constitute a quorum at all meetings.
>
> The executive secretary shall give such reasonable notice of all special meetings as the committee shall by vote prescribe, and all such notices shall as far as practicable, specify the business to be brought to the attention of the committee at such meetings.

The executive committee also considered the advisability of permitting representation of its members by proxies but after full discussion it was decided not to favor this practice.

The committee also adopted an appropriate resolution on the death of C. B. Holmes, president of the American Street Railway Association in 1887 and 1888.

Those present at the yacht meeting of the committee were: President R. I. Todd; Vice-Presidents C. D. Emmons and F. R. Coates; L. H. Palmer, W. H. Sawyer, L. E. Gould, Geo. Tontrup; Past Presidents C. L. Henry and J. J. Stanley; Executive Secretary J. W. Welsh, and the following guests: H. B. Flowers, E. M. Walker, W. S. Rodger, M. B. Lambert, H. J. Kenfield and H. V. Bozell.

The next meeting of the executive committee was scheduled to be held in New York City, Friday, Aug. 25.

Engineering Association Nominations Announced

THE committee on nominations of the Engineering Association appointed has submitted the following list of nominees for officers and members of the executive committee for the coming year.

President—L. C. Datz, chief engineer the Little Rock Railway & Electric Company, Little Rock, Ark.

First Vice-President—H. A. Johnson, assistant to general manager, Metropolitan West Side Elevated Ry., Chicago, Ill.

Second Vice-President—C. H. Clark, engineer of maintenance of way, Cleveland (Ohio) Railway.

Third Vice-President—R. C. Cram, engineer surface roadway, Brooklyn Rapid Transit Company, Brooklyn, N. Y.

Secretary and Treasurer—James W. Welsh, New York, N. Y.

For members of executive committee: Charles R. Harte, construction engineer The Connecticut Company, New Haven, Conn.; Daniel Durie, general superintendent West Penn Railways, Connellsville, Pa.; R. H. Dalgleish, chief engineer Capital Traction Company, Washington, D. C.; E. H. Scofield, engineer of power Twin City Rapid Transit Company, Minneapolis, Minn.

The members of the nominating committee, making the above report are: H. H. Adams, chairman; E. R. Hill, Sidney Withington, M. B. Rosevear and W. F. Graves.

Exhibit Space Being Assigned

THE Convention Committee on exhibits has commenced the assignment of exhibit space on the Municipal Pier to those manufacturers which up to this time have sent in their applications. Up to Tuesday, August 1, 51,000 sq.ft. of exhibit space had been applied for, and at the rate that applications are being received it is expected that the remaining 10,000 ft. will soon be taken. Should requests be received for more than 60,000 sq.ft. provision for additional exhibitors can easily be made. Some little trouble was experienced in meeting the requests of exhibitors as to location of space because of the long narrow shape of the pierhouse.

Recent Happenings in Great Britain

Municipal Tramway Financial Results—Start of Development Work on London Underground Railways—Electrification Completed

(From Our British News Representative)

OWING to the season of the year this letter is largely devoted to financial matters. In order that readers may see how the big municipal tramway concerns are weathering hard times, an indication is given of the accounts now being issued in regard to a few of the most important of these undertakings. The poor showing of London is largely explained by the high capital charges for the conduit system and the intensity of motor omnibus competition. Neither of these factors prevails elsewhere. The finance of the London underground railways and the beginning of their big new development work also receive attention. So do the completion of the London & North Western Railway surburban electrification and the enveloping success of Glasgow Town Council. There are indeed many "happenings" at present on this side of the water.

Municipal Results Elsewhere

The accounts of the London County Council Tramways for the year ended March 31 last show a deficiency on working of £88,757 after payment of all charges including interest and sinking fund. The total revenue was £4,904,427 in the previous year. After paying operating expenses and half the cost of renewals there was a surplus of £570,581, against only £65,134 in the preceding year. After allowing, however, for capital charges, there is the deficit stated above. The passengers numbered more than 688,000,000, or a trifle less than the preceding year, but the average fare was higher. The miles of route operated number 156; the receipts per car mile were 20.39d. (against 19.91d.); the working expenses were 17.68d. per car mile (against 19.3d.). In the current year the whole (instead of the half) of the cost of renewals will be charged to revenue, but despite that it is estimated that there will be a surplus of £38,337.

The accounts of Glasgow Corporation Tramways for the year ended May 31 last show that the receipts were £2,350,752, a decrease on the previous year of £42,101, while the expenses, including £413,521 in respect of maintenance and repairs, amounted to £1,804,652, being £133,012 less than the costs of the previous year. Various amounts, which included £309,349 in name of renewals and depreciation, have been set aside, leaving a balance of £152,723 from which there falls to be deducted £2,735 the balance of the deficit for 1919-20. This, accordingly, leaves an available surplus amounting to £149,988 to be placed to the credit of the Common Good. Considerable economies have been effected with regard to general expenses, which are almost £36,000 lower than last year's; maintenance and repairs, which have been decreased by over £48,000, and power expenses, which are reduced by nearly £37,000. Since June, 1914, the department has been carrying its own third party accident risk. The sum of £40,000 has been placed at the credit of this fund for the past year; the claims and other expenses paid in connection with the fund during the year amounted to £35,821, and the balance at the credit of the fund on May 31 was £20,841. With regard to the employers' liability and workmen's compensation risk, which the department took over in June, 1915, the sum placed to the credit of the fund for the year was £3,500; claims and other expenses amounted to £2,022, and the balance stands at £5,282. The cars in stock number 956.

The accounts of Birmingham Corporation Tramways for the year ended March 31, 1922, show that the total receipts were £1,520,741 compared with £1,156,654 in the previous year. The total expenses were £1,164,591, against £1,328,943. The credit balance was thus £356,150, against £327,711. After meeting interest, sinking fund, etc., there was a net profit of £192,541, of which £71,524 was carried to suspense account and £121,017 to renewals fund account. The number of cars in use is 636.

The accounts of Manchester Corporation Tramways for the year ended March 31, 1922, show that the total revenue was £1,994,577, as compared with £1,813,401 in the previous year. The working expenses were £1,519,838, against £1,507,506. After meeting interest on the redemption of capital charges, there remains £256,572, against £124,429 in the preceding year. Out of this, £218,842 goes to renewals fund and the remainder to the payment of income tax. The traffic revenue per car mile was 24.36d., against 23.12d., and the working expenses were 18.74d., against 19.34d. The passengers numbered 281,140,974 against 277,738,710. The route length operated is 120 miles.

London Underground New Capital

In the end of June the London Electric Railway Corporation and the City & South London Railway Corporation made an issue of £2,500,000 of second debenture stocks of the price of 94. The rate of interest is 4½ per cent. This is the sequel to obtaining a Government guarantee under the Trade Facilities Act of principal and interest of the new capital for the improvement and extension of London underground railway system.

The works authorized by Parliament to be constructed by the London Electric Railway Corporation are an extension of 4½ miles from Golders Green to Hendon in the northern outskirts of the metropolis, a junction line connecting the City & South London and the Charing Cross and Hampstead lines at Camden Town, a junction at Hammersmith between the Great Northern and Piccadilly line and the London & South Western Railway, the reconstruction of various stations, and the provision of additional rolling stock. An extension of time for the completion of these already authorized works to 1926 is proposed. The works to be carried out by the City & South London Corporation are an enlargement of tunnels so as to make them of approximately the same diameter as those of the other "tube" railways, and the provision of new rolling stock. The carrying capacity of the City & South London Railways will be doubled.

In the end of June the City & South London Railway Corporation issued a notice that on Aug. 9 the northern half of the railway (namely the part between Moorgate and Euston stations) will be closed. On that date the work of reconstruction of the tunnels will be begun. In substitution for the railway facilities, a three-minute service of motor omnibuses will be run on the streets between Euston Road and Moorgate.

Congratulations to North Western Railways

The London suburban electrification scheme of the London & North Western Railway Company is now complete. The last section to be electrified, that from Euston to Chalk Farm, began electrical working on July 10. The scheme has been frequently described, but a few main points may be recalled. With the exception of the mile and a half from Euston to Chalk Farm, the rest of the lines have been working electrically for some time, some for several years. The completion was delayed by the war and by the enormous works required at the complicated Chalk Farm junction and by the construction of additional tunnels under the adjoining Primrose Hill. The total length of route electrified is some 30 miles, including associated lines over which the company runs its trains. There are two routes from the center of London (Broad Street and Euston) which unite at Chalk Farm, whence the line goes on to Watford. There are also the Hampstead loop and the branches to Earl's Court and Richmond. Further, there is through running to and from the south of London by a junction with the Baker Street & Waterloo (tube) Railway. Apart from occasional tunnels, all the lines are on the surface except the Baker Street & Waterloo, the mileage of which is not included in the above total. It is eight years since the first of the converted lines was operated electrically.

Concluding Stage Reached

Buffalo Company Proceeds Against Jitneys Now That Railway Service is Normal

Herbert G. Tulley, president of the International Railway, Buffalo, N. Y., has made a formal demand on Mayor Frank X. Schwab to stop all jitney and bus lines operating within the city in violation of the state laws. If the Mayor fails to enforce the law, the legal department of the International will apply to the courts for a writ of mandamus requiring the municipal authorities to rid the streets of jitneys.

This move on the part of the International was prompted because normal day and evening service is being given on all local and interurban lines of the company and night service on most lines is continuous up until 12:30 a.m.

In explanation of this demand on the Mayor to rid the city of jitneys, President Tulley issued this statement:

> To avoid inconveniencing the riding public, the International Railway has refrained from proceeding against unlawful jitney operation until it could again itself render adequate service. The International Railway is now operating day and night cars on all Buffalo lines and has therefore, petitioned the proper authorities to order the discontinuance of jitney competition.

There have been many desertions from the ranks of the strikers and many former employees have signed up with the company to operate cars. The great bulk of the employees now operating cars, however, are vacationists from the Philadelphia Rapid Transit Company, but there are a few men from Baltimore, New York, Albany and Troy. More than 80 per cent of the men are housed at Camp Tulley at the Cold Springs barns.

Members of the New York state constabulary who were detailed to active duty in Buffalo during the early days of the car strike to protect the company's property and prevent riots have been withdrawn from the city.

With the removal of the jitney lines from the streets, President Tulley of the International believes that the strike will be practically ended. Passengers then will begin riding and it is expected normal conditions again will prevail. The company has recruited a sufficient force to operate normal service on all lines even during the morning and evening rush hour periods. Police are riding in each car and motorcycle patrolmen are stationed at important intersections throughout the city in case of rioting or disorder.

After the Chamber of Commerce and the International had rejected his proposal for each to designate five members of a committee to investigate the strike, Mayor Frank X. Schwab appointed his own committee which finally submitted majority and minority reports, being unable to agree as to which side was responsible for the trouble.

Both reports reviewed at length the causes leading up to the strike but did not touch upon any phase of the company's viewpoint because President Tulley of the International refused to participate in the investigation.

In declining to appear before the citizens' committee, Mr. Tulley issued this statement:

> Mitten policies saved Buffalo from a threatened strike during the Pan American in 1901 and for more than ten years kept Buffalo street railways free from strikes. Mitten influence was withdrawn from Buffalo in 1912. Unionism then became dominant and discipline suffered. No man could work without first joining the union which, in 1918 during the war, broke its contract with the International Railway and subjected Buffalo to a long drawn out strike.
>
> Mitten management has publicly proved that the present strike could not have occured if the union had faithfully observed the terms of the Mitten-Mahon understanding which, at the local union's own request, had been extended to cover 1922. Mitten management will not participate in futile hearings planned by the union and the Mayor further to mislead the men, who by false hopes are encouraged to hold out against the company while the opportunity of regaining their former places is rapidly slipping away.
>
> Mitten management present procedure will remove the possibility of further strikes and, while still endeavoring, with the help of Philadelphia Rapid Transit vacationists, to save all possible jobs for the misled strikers, Mitten management will have no further dealings with this union which has repeatedly repudiated its own undertaking.

The action taken by the company against the operation of the buses was successful to the extent that the Public Service Commission ruled on Aug. 3 that it considered the operation of the buses illegal in that the owners were operating without the consent of the commission.

Municipal Operation Begun in Ashtabula

Ashtabula is the first city in Ohio to try municipal ownership of its street car lines. The city formally took over the Ashtabula Rapid Transit Company's property on Aug. 1. Purchase of the property for $150,000 was authorized by the voters last spring. The money for the purchase of the bonds on the lines was obtained from a surplus contained in the city's municipal electric light fund. This surplus was due to the fact that a $1,000,000 bond issue had been sold for extending the municipal light plant and only $760,000 of it spent because of price reductions made before the light plant extensions were built.

Fare on the Ashtabula municipal lines will continue to be 8 cents, according to city manager W. M. Cotton. The city also plans soon to issue $35,000 of bonds for the purchase of one-man cars.

It is interesting to note that bond issues recently authorized by the Ashtabula City Council including the $150,000 for the purchase of the city railways, now brings that city's bonded indebtedness up to within $20,000 of the amount it is legally permitted to have.

Awaits Referendum Election in Akron

An unusual situation has arisen in Akron, Ohio, where The Northern Ohio Traction & Light Company operates a city system in conjunction with its interurban lines. A special referendum election has been called for Aug. 8 and the electorate called upon to vote upon a temporary franchise to remain in force until February, 1924. The franchise was passed by the City Council last April and provides for:

1. Construction of a new line from the downtown district on Main Street across the new $2,000,000 viaduct, through the North Hill district to Cuyahoga Falls Avenue on the north, a distance of nearly one mile.
2. Establishment of eight new bus lines as feeders to the present street railway system.
3. Rebuilding of a portion of the West Hill line.
4. Continuation of the 5-cent fare until Feb. 1, 1924.

The referendum petitions, containing nearly 4,000 names, were filed fifty-nine days after the Council passed the franchise ordinance. The city charter provides petitions must be filed within sixty days. The state constitution provides they must be filed within thirty days.

Following the calling of the election, The Northern Ohio Traction & Light Company announced that it had bought all material for all work provided for in the franchise and that, "having faith in the voters of Akron" it would at once begin:—

1. Laying tracks on the viaduct so the structure could be opened for public use without delay. (Tracks are being laid.)
2. Rebuilding the West Market Street line immediately (the work is nearly completed).
3. Purchasing buses and installing the routes as fast as the buses arrived. (Most of them are now in service.)

So far as can be determined at this time there is little or no opposition to the franchise. Many voters who signed the petitions have since announced that they signed with a misunderstanding of the petition. By the time the election is held practically all provisions of the contract will have been carried out, and if the franchise is defeated the only effect of it might be to reduce the fare to six tickets for 25 cents. In view of the fact that the legality of the referendum is in doubt, it is probable, however, that even this would not happen. But there appears little doubt that the franchise will carry a heavy vote. The company is making no aggressive campaign.

Terminal Project Revived

More Than $1,000,000 Ready for Investment in Kansas City—Industrial Line Sold Under Foreclosure

Development of the Kansas City-Outer Belt Electric Railway, a project originally conceived by Arthur E. Stillwell twenty years ago, seems about to be undertaken. The property has been in the hands of a receiver for thirteen years. It was auctioned on June 28, but the highest bidder at this auction may not secure the property, as confirmation of sale is being held up pending action by the Federal Court in September. Whether or not J. J. Heim and his associates, who were the high bidders, secure the property, the improvement is said to be definitely assured.

LINE WILL TOUCH UNDEVELOPED FIELD

The project is significant as an undertaking in that it has for its object the construction of a belt line practically encircling Kansas City on the west, passing through a district that is now largely undeveloped industrially, touching bottom lands of two rivers.

The present developed industrial sections admit of very little further expansion. They are well served with railroads, switching facilities and "belt lines." The Outer Belt railroad is laid out to connect the undeveloped industrial sites of the Missouri bottoms, north, with the large industrial areas, only partly developed, along the Kaw.

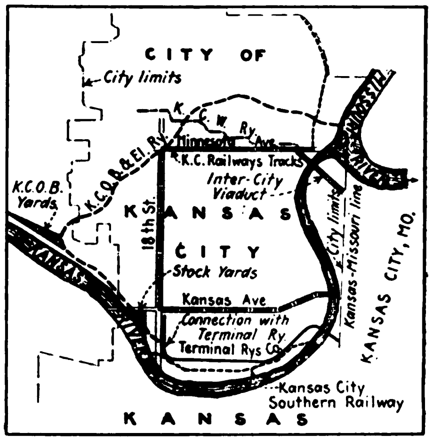
The Outer Belt Company had graded practically all of the right-of-way, 7 miles, entirely through Kansas City, Kan., from the Missouri to the Kaw. It owns about 245 acres of potential industrial switch property. Included in the tract are 40 acres in Clay County, Mo., across the Missouri from the large undeveloped tracts of Missouri River bottom lands in the State of Kansas. The Outer Belt Company has a site for a bridge across the Missouri connecting its holding in Missouri and in Kansas—a bridge which it has been declared must ultimately be built at or near this site eventually for accommodation of business. The company also owns 50 acres along the Kaw River, where industrial development is now proceeding; 12 acres adjacent to the Procter & Gamble soap factory, and 6 acres adjoining the plant of Peet Brothers. Ample acreage is reserved for the railroad's own yards.

WILL SOLVE FREIGHT CONGESTION

The Outer Belt right-of-way touches several steam railroads at various points. In the northeastern part of Kansas City, Kan., it crosses the Missouri Pacific and the Chicago Great Western. It also crosses the tracks of the Kansas City & Northwestern near the latter's station and yards, suggesting further possibilities for electric service for freight. The Outer Belt touches the Union Pacific and Rock Island near the Kaw River; and a bridge over the Kaw would provide connection with the Santa Fe near the latter's chief yards.

The factors that have caused more than local interest in the future of the Outer Belt road are increasing congestion in freight movement despite elaborate and efficient facilites, and the ultimate necessity for expansion into industrial districts not now extensively utilized. Many of these problems it is thought, could be solved by the complete development of the Outer Belt.

The original promoters of the Outer Belt conceived of it as an adjunct of the Kansas City, Mexico & Orient Railroad. Twenty years have made such changes in freight-moving conditions, however, that it is now conceived by most observers as a factor in electrically moved freight cars, either as an adjunct of an existing electric line, or as serving in terminal capacity to both electric and steam roads. The Kaw Valley line, which serves an industrial section the development of which has scarcely begun, now does as much freight as passenger business, so that the possibilities for an electric freight service in the valleys of both the Kaw and the Missouri may be considered fairly important, even as subsidiary to an electric line now operating.



ROUTE OF OUTER BELT LINE

The Kansas City-Outer Belt Electric Railway was promoted by Kansas City, Mexico & Orient interests, which had spent more than $2,500,000 on it. The bonds of the Outer Belt are owned by the bondholders of the Orient Railroad, which also is in bankruptcy. W. T. Kemper, receiver for the Orient, was a bidder at the auction, bidding up to $302,000. J. J. Heim and the interests identified with him, bid $330,900, which was not topped. Mr. Kemper has filed a motion to arrest the sale, and confirmation to Mr. Heim probably will not come before the court until September.

Mr. Heim is the chief owner of the Kansas City, Kaw Valley & Western Railway, an electric line. He and other officers were unwilling to discuss the project, pending action on their bid. It is well known, however, that if their bid is successful, probably more than $1,000,000 will be spent to develop the line as an electric terminal railroad.

Indianapolis Property Relieved of Paving

The Indiana Public Service Commission has relieved the Indianapolis Street Railway from the expense of paving between the tracks. It granted a petition which the company filed asking it to set aside an order of the city Board of Works, made under the authority of a city ordinance and directing the company to pave between tracks in certain streets. Although the order for paving was issued by the Board of Works, the proceeding before the commission was a friendly one and was so understood by the board and the city administration. Mayor Shank, himself, in a statement he made public, paved the way for procuring greater income for the car company.

The commission decided that when the company surrendered its franchises under the 1921 act, it was relieved from all obligations imposed by the old franchises and that the city had no authority to reenact the provisions by means of an ordinance. The order establishes a principle also at issue in Kokomo, East Chicago and other cities of the State. The commission said:

> It is not the province of the commission to say whether the paving between the tracks should be paid for by the abutting property owners, by the owners of vehicles or by the city out of its general fund, but it is certain that the street car riders, as a group, should not be assessed for such paving and, therefore, that the ordinance should be held to be unreasonable.

The commission referred to the poor financial condition of the Indianapolis Street Railway saying that a serious deficit from its operation now existed. Further, that no dividends had been paid in the five or six last periods past and that the company was in dire need of funds, and lacked credit by which it could finance improvements.

Railway's Propaganda Helps to Reduce Accidents

Through newspaper and card publicity the Monongahela Power & Railway Company, Fairmont, W. Va. has entered whole heartedly into the national Careful Crossing Campaign and as a result the number of accidents on road and street crossings along the lines of the local company is greatly reduced over the showing of a year ago. The company has been using its newspaper space in urging the public to be cautious when crossing over railroad tracks and will distribute thousands of cards showing the dangers of being careless.

Cleveland and Baltimore Compared

A comparison of the electric railway operation in Cleveland and Baltimore has been made the subject of a series of three articles in the Baltimore *Sun* by Harold E. West. The accounts were prepared after Mr. West had been investigating conditions in Cleveland following an announcement that fares in Cleveland would go down to 5 cents after Aug. 1. His articles explained in detail the service-at-cost franchise and how it came to be put in operation in Cleveland.

Surface and Elevated Lines Tied Up in Chicago

Review of Twelve Days' Parley When Placed Before Men Results in Vote to Go Out—Elevated Men Quit in Sympathy While Still Negotiating

CHICAGO is walking to work. At least a large part of it is, for both the surface and the elevated lines there are tied up by a strike declared on the morning of Aug. 1. The disposition of the steam railroads and the owners of autos and trucks has been to do everything possible to transport the workers in the emergency, but the steam railroads themselves are suffering from a strike among their own employees and no amount of traffic by motor vehicle can be made to compensate for the service of the surface and elevated lines.

So far as the Chicago Surface Lines are concerned the action of the men in going out was more or less deliberate, but in the case of the elevated men it was precipitate. The meeting of these men—if it can really be called a meeting—was stormed. As soon as the fact had been established that the surface men had voted to go out, about 300 elevated men staged what purported to be a meeting and after voting they then sent couriers to all the terminals to notify the men not to man the elevated cars in the morning. To have placed in operation the machinery for a bona fide vote among the elevated men would have required several days and have resulted in the operation of the elevated for at least two days after the surface lines had shut down. This was a contingency fraught with so many elements of danger to itself that the union sought safety in the expedient of calling an impromptu meeting and voting at this gathering—for such it was—to go out at once.

At the meeting of the surface men on the evening of July 31, President Quinlan of the union presented to the men a summary of the events of the previous twelve days reviewing the wage negotiations, more particularly the events of the day then drawing to a close. The decision of the men was that matters should be brought to a climax by the men going out.

The negotiations of the last few weeks between the men and the managements have been reviewed at length in the *Electric Railway Journal*. In short, the street railway men are striking for a higher wage than the Surface Lines have offered them and for continuance of the eight-hour day. They were first offered a contract for one year at 60 cents an hour, 20 cents less than they have been getting, and time and a half after nine hours instead of eight. They rejected the offer and a compromise offer of 65 cents was made. This, too, was rejected. The union leaders offered to carry back to the men for approval a wage offer of 72 cents an hour and time and a half after eight hours, but this the Surface Lines rejected.

The elevated union leaders called out their men by reason of an agreement with the street railway union. They were still negotiating with the elevated lines for a wage offer when their meeting was stormed, but none had been made officially up to that time. The elevated lines have said only that they would not offer a contract for a full year at the old scale of 82 cents.

Mayor Thompson, President Henry A. Blair of the Chicago Surface Lines, President Mahon of the Amalgamated Association, President Quinlan of the Surface Lines' Union and President Mylon of the Elevated Lines' Union were all prompt to issue statements. Mayor Thompson referred to the probable policing arrangements and said that he would welcome any effort made to settle the strike.

Mr. Blair said:

> In yesterday's conference with union chiefs, business men, and city officials, I made no newer offer than that authorized several days ago by the board of control of our company. I will be glad to meet with union officials and convey any proposal made by them to the board of control.

Mr. Mahon said:

> As I explained to the Council committee last night, I have made every effort within my power during the last twelve days to bring the officers of the company and the employees together and avert a strike. I am more than sorry at the turn things have taken. I will now leave the situation in the hands of the local officers, with hopes that they may be able to bring about a speedy settlement.

Mr. Quinlan said:

> I held the men as long as I could. We made every effort to avert the walkout. We offered arbitration; we offered to compromise. Our offers were rejected. The men were fully informed as to the situation; they made their decision.

Mr. Mylon said:

> I had an agreement with President Quinlan under which we were to call a meeting Wednesday night to act on the strike; we planned to walk out—if we did go out—Thursday morning. Events of last night left us facing either an immediate strike or going back on the men who are employed on the Surface Lines. I called an emergency meeting; those present decided to go out at once.

Chicago began the second day of the complete tieup of its elevated and surface lines with industry functioning almost normally on emergency methods of transportation. No effort has yet been made to resume local railway service, nor is there any prospect of any attempt being made to restore service for several days. The traffic tangle of the first day in the so-called loop district, where most of the office buildings and stores are located, has largely straightened itself out with auto drivers becoming more familiar with the one-way traffic rules. The jam on Michigan Boulevard, the principal north and south drive, was absent on the second day because many automobilists were diverted to other streets. Conditions in that locality were also benefited by keeping the buses of the Chicago Motorbus Company out of the loop. Very few buses have come into the city from outside towns and the effect of those that have come, upon traffic, is negligible. The vacant seats in private automobiles so completely filled the gap that operators of improvised buses charging 25 cents for a short haul had trouble filling their cars. Some carriers attempted to capitalize the opportunity by charging 50 cents or more for the 6 miles from the downtown district to Wilson Avenue.

The efforts of the steam roads to aid the tangle has been one of the outstanding features. The Chicago & Northwestern carried 90,000 into the loop on Tuesday. The Illinois Central is now prepared for 200,000. All other roads have greatly augmented their service by adding more trains and opening emergency stations. The North Shore interurban is operating over the elevated as usual, but is not carrying any local passengers.

Both sides appear to chalk up the controversy against the politicians. Between the companies and the men there seems to be no particular unfriendliness. The Board of Operation of the Surface Lines announced on Aug. 2 its willingness to sit with the Schwartz local committee on transportation which Mr. Blair on Aug. 1 refused to meet. The latest statement from the Surface Lines says there is no intention of attempting to run the cars with strikebreakers on Aug. 3. The several hundred men who have been employed through various agencies are for adequate watch service. The board also says it will be glad to hold a special meeting to listen to any suggestions that may be calculated to expedite a settlement.

Mr. Blair and the union leaders met on Aug. 2, but the nature of the negotiations was not made public. It is understood, however, that the Chicago Surface Lines insists on a thirty-day cancellation clause being embodied in any agreement since there is possibility that the Illinois State Commerce Commission may order a further reduction in fare. No progress was reported after the meeting on Aug. 3 between the board and union leaders. The company insists it will arbitrate all or nothing. Mr. Quinlan for the men would arbitrate wages between 72 and 80 cents, but not an eight-hour day. So far no attempt has been made by the city to get the representatives of the men and the officers of the company together.

John J. Stanley's Merits Receive Recognition

Friends of John J. Stanley everywhere in the industry will subscribe heartily to the sentiments about him expressed by W. R. H. Hopkins in a recent letter to the Cleveland *Plain Dealer*. Mr. Hopkins said:

> I read with interest your editorial regarding the Cleveland Railway, the prospect of lower fare and the Tayler plan. Clevelanders certainly ought to know and appreciate the fact that we have the best street railway service in America.
>
> I was especially interested in your recognition of the fact that the Tayler plan is not free from defects and presume you had in mind its failure to provide any incentive for good management. This one defect would have gone far to prevent any lasting success under the plan had it not been the good fortune of Cleveland to have the operations under the plan put into the hands of John Stanley.
>
> In any other American city the Tayler plan could not have succeeded as it has in Cleveland, because no other street railway system is managed by a man whose entire life has been devoted to it, whose personal fortune is largely invested in it, whose ability and courage and dogged devotion in management approach his.
>
> When John Stanley undertook to operate the Cleveland railway lines under the Tayler plan, he did so only because he felt in honor bound to do so. He had little reason to like it or want it to succeed, but it was the best bargain his company could get and he gave his honest best to make it succeed.
>
> The result we all know. The Tayler plan plus John Stanley is a great success. It is one of the few things we have that we can safely declare the best of its kind anywhere.
>
> This being so, isn't it about time we quit talking about the Tayler plan as an automatic device of perfection and begin giving some public credit to the man who made it succeed in spite of its defects?
>
> A moment's reflection will suffice to show that the proposed reduction of fare was made possible entirely by his courage and devotion to the general public interest in a situation which must have been officially unpleasant and could not have been personally profitable to him.
>
> Let this one debt be fairly recognized.

Mr. Hopkins promoted and put over the Cleveland Belt Line, a steam railroad proposition. He is well known in financial and traction circles throughout the country. One of his ambitions has been to see Cleveland furnished with rapid transit service by means of a subway.

New Wage Scale in Effect

The new wage agreement affecting trainmen in the employ of the Tulsa (Okla.) Street Railway which became effective in April of this year provides the following rates of pay in cents per hour:

First three months	40
Next nine months	42
Next six months	45
Next six months	48
Thereafter	50

There was practically no other change in the working agreement. The old scale in cents per hour was as follows:

First three months	46
Second three months	48
Third three months	50
Fourth three months	52
After twelve months	55

Consider Trolley Business Getter

Whether or not street cars are a boon to business on streets over which they are operated is the question brought to the fore in Houston, Tex., by the change in routing cars which virtually takes them from the main street entirely and instead puts the majority of the lines on a heretofore "back street." The change was effected in order to overcome traffic conditions and is somewhat in the nature of an experiment, the old tracks being covered with a light cover of tarvia. The slow moving electric cars before looked on as a necessary evil and oftimes considered a fit subject for a sacrifice to the jitney lines suddenly emerged from their obscurity into the limelight as a medium of bringing business right to the marts of trade. Main Street merchants protested to the City Council about the cars leaving their street.

Electrification of the Swiss Federal Railways

The Swiss Government has just appropriated the amount of 11,000,000 francs for the purchase of twenty electric locomotives. Thus far, the electric traffic has proved extremely satisfactory and it is now intended to electrify another 300 km. It is stated that the energy now generated in the large power stations already in operation and partly constructed will be sufficient to supply the current for another 300 km. During the next four or five years another 100 electric locomotives will be required, and as the construction of the twenty locomotives will require a period of about two years it is intended to place the orders for the 100 locomotives in the very near future. All orders will be placed with Swiss electrical works to assist this industry in Switzerland, which is seriously suffering from bad economic conditions. All the above orders will call for electric fast train passenger locomotives of 90-km. per hour maximum velocity.

News Notes

Terminal Railway Improving Its Line.—The Iowa Transfer Railway, of Des Moines, Ia., has applied to the Interstate Commerce Commission for authority to issue $40,000 of capital stock to purchase an electric engine and to extend the electrification of its terminal property in Des Moines.

Will Pay Borough for Paving.—The Borough of Castle Shannon has just closed a contract with the Pittsburgh (Pa.) Railways whereby the company is to pay Castle Shannon $22.57 a year, in lieu of all pole, car, wire and license taxes and liability to clean streets. The borough is to do all paving between car tracks and is to receive $288.24 from the company for this purpose.

Will Care for Employees' Health.—The San Diego (Cal.) Electric Railway recently established a welfare department to care for the health of employees and their families. Claus Spreckels, general manager of the San Diego & Coronado Ferry Company and the Point Loma Railroad, as well as the San Diego Electric Railway, in making this announcement said that the good health of the employees and their families was a matter of first importance to the transportation companies.

Louisville Has Talent.—The Inspectors' Quartet of the Louisville (Ky.) Railway, said to be the only inspectors' quartet in the country, recently was presented as the feature of the weekly luncheon of the local Kiwanis Club. The quartet, composed of George Haley, Andrew Anderson, Samuel Merrifield and Albert Doerer, gave several songs for the edification of its audience. The Inspectors' Quartet also appeared on the radio program broadcasted by the Louisville *Courier-Journal*.

Suggested Trackless Trolley Solution.—No settlement has yet been made by the City Council of Champaign, Ill., and representatives of the Urbana & Champaign Railway in the matter of a franchise. The company and city are to share the expense of paving Church Street. The company maintains that the cost of paving and laying new rails would approximate $150,000, whereas the profit on this line is about $4,000. The railway has offered as a solution of this present stumbling block to a settlement that the company install trackless trolleys on Church Street. Installation of this service would cost about $75,000, it is stated.

Good Time Had By All.—The first annual picnic of the Veteran Employees Club of the Twin City Lines was held July 19 at the company's picnic grounds, Wildwood, White Bear Lake, a suburban district to St. Paul. Men eligible have been twenty years or more in the service of the company. St. Paul and Minneapolis played a ball game, fat men had a tug of war and best of all was a boxing match between Jerry Hagerty of the Stillwater division and E. E. Smock of the North Side division, two tallest men in the club. President Horace Lowry, Treasurer A. E. Crosby and E. H. Scofield, superintendent of the power and light department, are members.

Bill to Increase Utility Tax.—A bill has been introduced before the present session of the Georgia State Legislature that, if passed, will increase the taxes of all public utilities in the State, this additional amount to be used for the financing of the work of the State Railroad Commission. The bill has already been favorably reported upon and its passage now seems a certainty. The measure presumes that since the commission regulates the utilities of the State, the utilities themselves should be made to bear the costs rather than the state, and therefore under the terms of the bill there will be an additional tax levied to take care of this fund in proportion to the assessed tax value of the properties owned by the said utilities. As the annual amount required, which will include the pay of rate experts, appraisers, engineers, accountants, etc., is something less than $40,000, the added tax will not act as a burden upon the utility corporations.

Financial and Corporate

Surplus in June

Community Traction Reduces Operating Ratio — Stabilizing Fund Reaches $137,209

Decrease of operating ratio, accumulation of surplus for fare stabilizing fund, and the successful initiation of one-man car service on the Bancroft line, were features of the report of the Community Traction Company made by Street Railway Commissioner Wilfred E. Cann to the board of control at Toledo for the month of June. The June surplus was $9,574, somewhat smaller than the previous month, but maintaining the increase in the fare stabilizing fund and assuring the continuance of previous wage scale for another six months. Last June the operations of the railway showed a deficit of $52,963.

JUNE REVENUE $293,835

The total revenue for the month of June was $293,835, which was $10,577 less than the revenue in May, due to a shorter month and a slight decrease in passenger carrying.

Revenue passengers carried for the month amounted to 4,911,677, a decrease as compared with the same month last year of 358,797.

Cash in the municipal ownership fund now amounts to $150,894 and in addition $150,000 in bonds have been purchased. The bonds are earning $745 in interest each month which is credited to the fund. The stabilizing fund is now $137,209.

The company is now converting sixty more of its cars to be operated on the one-man plan and several other lines will soon be placed on a better paying basis through the change.

IMPROVEMENT CAMPAIGN UNDER WAY

The company now has on a big improvement campaign which will include the laying of many miles of new steel track and general improvements to total about $750,000. This work is being financed through use of the cash balances in several of the funds set up.

For comparative purposes the commissioner set up the figures for the last six months showing that for the half year ending June 30 passenger revenue has amounted to $1,672,923 and total revenue was $1,674,458. The operating expenses were $1,017,658 which left net earnings $656,799.

Other revenue was secured from rent of tracks and terminals amounting to $83,413; rent of equipment, $7,902; station and car privileges, $9,961; credit on power, $11,592; and miscellaneous revenue, $8,451.

With other revenue the gross income from all sources amounted to $778,122. For the depreciation fund, $21,250 was set up, for the maintenance and repair fund, $220,000; for sinking fund—municipal purchase—$106,250; for taxes, $99,718. Bond interest and dividends on preferred stock amounted to $260,000.

1921 Satisfactory Year for Illinois Traction

The highest gross and net earnings in the history of the Illinois Traction System, Peoria, Ill., are recorded in the eighteenth annual report recently presented by the board of directors to the shareholders. It is stated in the report that the showing for the year may be considered as highly satisfactory. The statement of earnings for the year ended Dec. 31, 1921, is shown in the following table.

Year ending Dec. 31, 1921		
Gross earnings from operation:		
Electric light and power	$8,139,355	
Interurban lines	7,161,772	
City lines	4,564,507	
Gas	1,555,134	
Heat	498,039	
Water	19,032	
Miscellaneous	663,052	
Total earnings		$22 600,894
Expenses and taxes:		
Operating expenses	$11,950,260	
Maintenance	2,937,391	
Taxes	1,200,963	
		$16,088,615
Net earnings from operation		$6,512,279
Less fixed charges:		
Interest charges, etc.	$3,386,514	
Bond discount amortized	135,865	
		$3,522,380
Surplus available for depreciation and dividends		$2,989,898
Dividend on preferred stocks:		
Subsidiary companies	$880,445	
Ill. Traction Company	437,370	
		$1,317,815
Balance		$1,672,083
Appropriated for depreciation		1,504,037
Balance surplus year 1921		$168,045
Surplus Dec. 31, 1920	$1,245,457	
Less: miscel. charges	24,925	
		$1,220,531
Surplus as shown on balance sheet		$1,388,577

The gross earnings increased nearly 6 per cent over the gross earnings of 1920. Operating expenses and taxes, however, increased 4 per cent and of this amount increased taxes of nearly $300,000 are responsible for one-half. Net earnings from operation show an advance of more than 11 per cent. Operating economies are reflected in wage reductions amounting to $233,410.

The number of revenue passengers carried on the interurban lines decreased approximately 14 per cent and on the city lines 10 per cent. The receipts from freight traffic, however, increased nearly 9 per cent.

W. B. McKinley, who is president of the board, referred to the practice of selling the securities of the subsidiary companies directly to the consumers in connection with the financing of improvements. He states that the offerings of notes, bonds and stocks were readily absorbed by the different communities.

Time for Making Deposits Extended

Grayson M. P. Murphy, chairman of the Interborough-Metropolitan 4½ per cent bondholders committee, has issued a notice stating that the time for the deposit of the 4½ per cent bonds and certificates of deposit has been extended to Aug. 15, 1922, after which time no further deposits will be accepted. The deposits are to be made under the Interborough-Manhattan plan of readjustment. Approximately 89 per cent of the total outstanding bonds of the issue have been deposited with the committee, and about 94 per cent of the depositors have elected to purchase new Interborough ten-year 6 per cent notes pursuant to the plan. It is understood that bondholders who fail to deposit their bonds or certificates of deposits will forfeit the right to make further deposits and to purchase the new Interborough notes, unless under the conditions the committee may impose.

Alvin W. Krech, chairman of the stockholders protective committee of the Manhattan Railway, has issued a notice that although an insufficient number of deposits have been made to make the plan approximately 78 per cent of the stock has been deposited. In view of the fact that so large a number of stockholders have indicated their desire that the plan be carried out, he said that the committee feels that it should continue to accept deposits up to Aug. 15, 1922, after which time no further deposits will be accepted.

Issues First Mortgage Bonds

A syndicate headed by H. M. Byllesby & Company, Chicago, recently offered $6,000,000 of the Southern Colorado Power Company's first mortgage 6 per cent gold bonds, series "A" to be dated July 1, 1922. The bonds which will fall due July 1, 1947 were offered at 94 and interest to yield approximately 6.50 per cent. The Continental and Commercial Trust and Savings Bank, Chicago, will be trustee. The proceeds from the sale will be used partly for redeeming the bonds and notes of the Pueblo & Suburban Traction & Lighting Company and The Arkansas Valley Railway, Light & Power Company.

Property Sold for $1,000,000

Under an order of the United States Court, George B. Tripp, receiver for the South Carolina Light, Power & Railways, Spartanburg, S. C. on July 31 sold all the property of the company including the railways, hydro-electric plant, gas and steam electric plants at auction. The property was bought in by the reorganization committee for $1,000,000, there being but one bid. Plans for the reorganization of the company have been completed and the properties sold will shortly be taken over by the South Carolina Gas & Electric Company. Mr. Tripp will probably be the president of the new company.

Preliminary Valuation Presented

Expert for City Thinks Five-Cent Fare Adequate to Needs of Minneapolis Company

In a thirteen-page document which is preliminary to his final report on the valuation he has been making of the property of the Minneapolis Street Railway as expert for the city, Delos F. Wilcox recently estimated that with a fare of 5 cents the company could continue to finance its extensions and improvements to the same extent as it has been doing for seven years, pay all operating expenses and taxes, and have left an operating income of $225,000 in excess of a 6 per cent return on the amount of the investment contributed to the company by the holders of its securities.

This preliminary report deals largely with the financial history of the company. It estimates the amount investors have put into the Minneapolis Street Railway as $15,257,273. Mr. Wilcox is acting for the city in the case brought before the Railroad & Warehouse Commission to determine the basis for ascertaining a proper rate of fare for the railway to charge.

The report says that the issue of a reduction in the fares to be charged rests squarely on the conflict in theories as to whether the company under all circumstances of its history is entitled to have its property valued for rate purposes on the purely theoretical basis of estimated reproduction costs at abnormal and unstable present prices to make good the water in its capitalization. On the prudent investment basis of valuation the company can get by with a 5-cent fare and finance itself out of its earnings. The report says that this means the end of the Twin City Rapid Transit Company dream of 6 per cent dividends on its common stock.

In speaking more particularly of the part of the report that concerned the finances of the company Vice-president T. Julian McGill said:

> Any comment on the latest Wilcox report can be only speculative opinion in answer to the highly speculative deductions proposed by Dr. Wilcox. The agreed value in 1919 was $24,000,000. Since that time several million dollars have been added to the road in the shape of improvements. It is self-evident that a 5-cent fare will not at this time produce a fair return on the value of the property. The company desires merely a fair rate of return on a fair valuation. The public can expect realities to supplant theories and speculations only after the valuation is determined.

In another part of the analysis report to the Minneapolis City Council its valuation authority, Delos F. Wilcox, on July 15, holds that the Minneapolis (Minn.) Street Railway's "opening" valuation figure of $12,867,320 is about $6,000,000 too large. And for that reason he holds that all valuations projected on the company's opening basis are that same amount too large.

The Wilcox report holds that the company's property cost as of Jan. 1, 1900, was less than $8,000,000 even including the superseded property charged to capital, and had been made up by surplus earnings. The company's books show additions to construction of $15,699,379, so that the whole would make a total valuation by the company of about $28,000,000.

President Horace Lowry said:

> The law requires that the city of Minneapolis and the Minneapolis Street Railway before the State Railroad and Warehouse Commission show a value of used and useful property for street railway purposes. The discussions, relative bookkeeping methods, value of securities and other irrelevant issues merely consume time and have made a most unusual expense for the car riders in Minneapolis.
>
> The public can be assured that there will be no excessive valuation of the property. The company merely desires a reasonable return on a fair value, and it will continue to give the highest standard of service and institute every economy to bring about the lowest possible fare.
>
> We would add that except for the fact that every department of the street railway has been constantly working and studying to introduce operating economies it would be impossible today to give the service being rendered at a 6-cent fare, which is lower than any other city having service comparable to Minneapolis.

Another installment of the Wilcox report was issued on July 29. This latest installment adds that the Cappelen valuation estimate of some years ago, prepared by the city engineer at that time and considered a standard work, was an appraisal of the property which would imply "friendly exaggeration" if made today. This attributed a 94 per cent condition and described the property as "strictly modern and of the highest grade throughout."

The present Wilcox report is to the effect that "evidence of depreciation, deferred maintenance and deferred renewal are now visible at many points." Mr. Wilcox says:

> Whatever the true cost of the physical property may have been up to 1900, there is only about $350,000 of it left in service. The rest has disappeared. It could not have been very old at that time. A storehouse and a blacksmith and millshop still survive at the Nicollet station. Of all the cars that were running at the beginning of 1900 only two are found in their original form in the inventory of Jan. 1, 1922, and a few others have been reconstructed and are now in use as trailers. Of the 125 miles of track and pavement "of the highest grade construction" less than 2 miles has survived the wear and tear. All the rest has been rebuilt.

The report contends that the car riders have paid several times over for the superseded or obsolete property of the company and the expert will deduct $5,536,000 from the cost of the property now in existence, instead of adding this sum for property that does not exist, which will bring the valuation in the neighborhood of $15,000,000. This $5,536,000 represents the depreciation of the existing property, as the amount collected since 1904 for depreciation and used in extensions and improvements, in lieu of new capital. Mr. Wilcox will deduct from the company's figure of $25,676,189, the amount of the unaccounted-for portion of the original entry, $6,858,000, as "water," as well as the company's renewal reserve of $5,536,000, leaving a total of $13,282,189 as the cost of the existing property, less book depreciation. He criticizes the Cappelen report of Jan. 1, 1916, for deducting only $1,279,851, or about 6 per cent, of his estimated cost new for accrued depreciation. Mr. Wilcox says:

> Depreciation is one of the factors in the street railway business that cannot be ignored without financial disaster. The Minneapolis Street Railway has been exceedingly prudent in this respect. Beginning at the end of 1904 it has built up renewal reserves which now amount to upwards of $5,500,000, which represents the company's own measure of the accrued depreciation on the existing property. These funds do not exist in cash, but they represent cash that actually has been collected from the car riders and charged from year to year to operating expenses. The company has used the money, practically the entire amount, in extensions and improvements in lieu of capital.
>
> This is a proper use for depreciation funds, for it has the effect of maintaining the integrity of the original investment by the provision of new property out of earnings to offset the depreciation in the property originally provided from capital funds furnished by the security holders. In a growing street railway system it is much simpler to maintain the integrity of the original investment in this way than it would be to reduce the capitalization on account of accrued depreciation and then restore it again in order to procure the necessary funds for extensions and betterments. It is perfectly clear, however, that the company is not entitled to include in the rate base its undiminished original investment and also the amount of the funds provided from the renewal reserves to maintain the integrity of that investment. The United States Supreme Court ruled upon that question in the Cumberland Telephone case in 1909.

Court Authorizes Inspection of Corporate Records

An order signed July 25 by Judge F. M. Nye of the Hennepin District Court following a two-day hearing which closed July 22 requires officers and directors of the Twin City Rapid Transit Company, Minneapolis, Minn., to give Neil M. Cronin, city attorney, and Delos F. Wilcox, the city's appraisal expert, information concerning a certain fund of $227,000 deposited in New York and the stock book records of the company. The order calls for a return at 10 a.m. on Aug. 21, but on argument by the attorneys for the railway time for appeal was granted by stay of proceedings to 10 a.m., Aug. 14. This order follows a series of legal steps by the city to obtain this information through mandamus and peremptory mandamus proceedings, preliminary to the presentation before the State Railroad & Warehouse Commission of facts in a hearing at which is to be determined a rate of fare in Minneapolis, which is now 6 cents temporarily.

The company must give a letter of instruction to the American Exchange National Bank, New York, to produce all records concerning the disposition of $227,000 deposited therein, whether in the name of Horace Lowery, president of the company, or any other individual. The railway must also instruct the Commercial Trust Company, New Jersey, to give access to records concerning the company's accounts since Jan. 1, 1919.

In the hearing on July 22 Judge Nye held that the records demanded by the city were within the mandates of a previous writ and judgment, which were broad in scope, and that everything that could be construed as a record, by which the examination of the company's properties could proceed, must be produced. On the first day he denied a motion for dismissal of the mandamus proceedings.

Time for Completing Reorganization Extended

The finance committee of the City Council of Pittsburgh, Pa., has voted unanimously to authorize C. K. Robinson, special city counsel in charge of public utility legislation, to join, on behalf of the city, in the railways company's petition to the Public Service Commission for an extension of time in which to reorganize the traction concern under an agreement recently made by the city, the Philadelphia Company and the railways company. Because of difficulty in financing, Mr. Robinson told the committee, it will be impossible to complete the reorganization of the company by Sept. 1, the date fixed by the commission. His advice that the city agree to an extension of time until Nov. 1 or later was accepted, the Councilmen's action being predicated on probable relief from present transit conditions.

The plan for the reorganization of the Pittsburgh Railways as agreed upon between the city and the Philadelphia Company was approved by the Public Service Commission last winter.

$1,385,211 Profit for Boston "L"

The fourth year of public operation of the Boston (Mass.) Elevated Railway ended on June 30, 1922. June operation resulted in an increase of 1,090,810 revenue passengers and a loss of $121,007 in total revenue but an excess of revenue over cost of service of $87,529.

The reserve fund created under the 1918 Act now totals $1,517,196, and $517,196 has been paid over to the Treasurer of the Commonwealth for distribution to the cities and towns that contributed to the loan assessment in 1919. The comparative revenue and cost of service figures for the four years as included in a recent bulletin of the company are reproduced in the accompanying tables.

BOSTON ELEVATED RAILWAY ACTUAL RECEIPTS AND COST OF SERVICE DURING FOUR YEARS OF PUBLIC CONTROL

"RECEIPTS"

	Year Ended June 30, 1922	Year Ended June 30, 1921	Year Ended June 30, 1920	Year Ended June 30, 1919
From fares	$31,690,852	$33,122,199	$31,899,420	$24,472,429
From operation of special cars, mail pouch service, express and service cars	70,901	88,518	105,554	115,623
From advertising in cars, on transfers, privileges at stations, etc.	308,161	303,046	297,036	293,079

Italics denote deficit.

Financial News Notes

Lines to Shut Down.—It was announced by the Aberdeen (S. D.) Railroad that railway service would be suspended on July 31. The company has been operating at a loss for several years. It is said that the company will give up its franchise and retire from business.

Brooklyn City Reports Net Income.—For the twelve months ended June 30, 1922, the Brooklyn (N. Y.) City Railroad reports a net corporate income of $1,812,581 against a deficit for the same period a year ago of $350,858. Passenger revenue for the 1922 period was $11,413,651 against $10,180,244 for the twelve months period ended June 30, 1921.

Pennsylvania Line Sold.—The Pottstown & Phoenixville Railway, Pottstown, Pa., was recently sold to John J. Taylor, of Philadelphia, chairman of the bondholders' protective committee, at a public sale for $75,000. The sale was the result of a foreclosure by the Norristown Trust Company, trustee, for a first mortgage of $1,000,000. The line has been in receivers' hands.

Gold Notes Offered.—Harris, Forbes & Company and the National City Company, both of New York, are offering $6,500,000 of the Toledo Traction, Light & Power Company's three-year 6 per cent secured gold notes. The notes due on Aug. 1, 1925, are offered at 98 and interest to yield 6¾ per cent. The purchase or call of these bonds will be effected through a sum exceeding $200,000 per annum accruing to the trustee through the operation of a sinking fund. The corporation owns $7,671,000 first mortgage 6 per cent bonds of the Community Traction Company and $13,135,400 par value, or more than 94 per cent of the outstanding common stock of the Toledo Edison Company, as well as large blocks of preferred stocks of these corporations.

Will Contest Sale.—Receiver for the New York & North Shore Traction Company, Roslyn, L. I., whose property was sold at auction in Mineola recently for $15,000, will try to have the sale thrown out by the court on the ground that the bid was insufficient. The property was said to have cost considerably in excess of $1,000,000, the power house alone costing $325,000. The receiver believes the property would bring much more if the various items were sold piecemeal. An attempt was made to find a private buyer some time ago, but since negotiations were begun, the Board of Estimate passed a resolution annulling its franchise. The prospective buyer, it was learned, was willing to undertake the rehabilitation of the property if he could secure better than the five-cent fare formerly in effect.

Traffic and Transportation

Investigation Still On

Committee To Look Into Affairs of Cincinnati Property Told to Reach a Conclusion

What will be the final outcome of the investigation being made by a committee appointed by Mayor George P. Carrel of Cincinnati into the affairs of the Cincinnati (Ohio) Traction Company? Will the traction company be permitted to operate its railway system in the manner its officials think it should be operated, or will the company be compelled to operate as a few individuals, who have no knowledge of electric railway transportation, think it should be conducted? When these questions are answered the traction question in Cincinnati will be solved. The investigation being made by the committee was not asked for by the traction company, nor has it requested aid in the settlement of its problems.

MAIN CONTROVERSY AROUND SERVICE AT COST FRANCHISE

A few individuals are of the opinion the valuation of the company is excessive and the fares too high, and this minority is responsible in a large measure for the present probe. It might be said that the whole controversy hinges on the service-at-cost franchise, although there are several other questions involved since the committee's investigation has been started.

In the early part of this year an ordinance was passed by the City Council providing that the city franchise tax against the Cincinnati Traction Company of $350,000 should not be taken into account in determining the cost of operation under the service-at-cost franchise. While the ordinance was under discussion the suggestion was made that a number of provisions of the service-at-cost ordinance, which has been in operation four years, might be changed in view of experience during the time which indicated that such changes might be advisable.

COMMITTEE APPOINTED

The City Council then requested Mayor Carrel to appoint a committee of citizens, and W. Kesley Schoepf, president of the traction company, agreed to meet with that committee and consider the points raised. These matters were the consideration as to the amount of capitalization of the several companies involved in operating and financing the local properties and the consideration of the possibility of simplifying the intercorporate relations of these companies.

So far the work of the committee has consisted of hearing suggestions from those who might be in a position to enlighten it on the subjects under consideration and particular attention has been paid to the question of the valuation of the company's property as written into the service-at-cost franchise.

The traction company's position in the matter is that it has no complaint to make regarding the working of the service-at-cost franchise and that the fares as well as the service in Cincinnati compare favorably with other cities. This, the company believes, answers the suggestion that the return to its stockholders is too high and also the suggestion that the property might be more economically operated.

The traction company in its statement filed with the committee on July 27, gives a complete history of the franchise, financings and operations of the local railway transportation system, presents detailed figures to show how the valuation was arrived at, what this valuation is as of today, and what the city would have to pay for the property in case it should buy, and makes some suggestions to the committee concluding as follows:

> Asked specifically what they would suggest this committee might do in the premises, the officials of the traction company confess that they find it difficult to make suggestions that would fall under either of the two heads that constitute the committee's program. It must also be remembered that the company has not asked for assistance, nor for the settlement of any question. The chief executive of the company has, however, stated to Mayor Carrel that he would gladly discuss the questions referred to and give any information that is desired and available.
>
> If there is any question unanswered or any problem unsolved, then by all means the traction company desires to have it answered or solved because without any reflection on the committee, which is earnestly trying to get full and valuable information and to discharge a public duty, the most important thing of all is for the committee to reach a conclusion that will be final and determinate so that the traction company will not have continually to face the discussion of "how the traction question can be settled."
>
> It is, to say the least, disturbing to the company. It takes time and effort from the ordinary operations and is very disturbing to the company's credit and more than once the public discussion of this ever recurrent question has interfered with important financing that would have been a great benefit to the company's patrons.
>
> If the committee therefore, can take such action as will aid in the direction of future financing it will have done a distinct service to the public. By this it would also aid largely in bringing about the second of things on its programme, and that is the simplification of the intercorporate relations of the companies engaged in street railway operations and other lines of endeavor in Cincinnati.

Mr. Schoepf appeared before the committee on July 27 and presented a prepared statement of the general traction situation and offered several suggestions which he said might assist the committee in its work. Mr. Schoepf told the committeemen that although receipts of the company have fallen off $1,000 a day the present 7½-cent fare is sufficient to meet all the ordinance requirements exclusive of the city franchise tax and will take care of about half the deficit in the earnings of $416,000 a year allowed the company.

Wants Action Deferred on Five-Cent Fare

Mayor E. J. Brown of Seattle, Wash., has urged the City Council to delay action looking toward a 5-cent fare on the Seattle Municipal Street Railway lines. Nothing further will be done about the matter until after the Circuit Court, to which the case has been appealed, renders a decision in the "specific performance" suit instituted long ago by the Puget Sound Power & Light Company, in which the company demands specific performance by the city of the terms of the railway purchase contract. The Circuit Court will hear the case early next fall.

In referring to the specific performance case, the Mayor said that if the contract was impossible of performance, it was a matter of vital interest to the people as well as the bondholders and that it would be unwise to tamper with the carfare until the case had been settled. Mayor Brown stated further that he would sign the proposed 5-cent fare ordinance if passed by the Council, but that he wished the Council to assume the responsibility for it at this time. He expressed himself as much impressed with the weekly pass system and stated "this is one of the plans we will have to consider."

George F. Russell, superintendent of public utilities, states that in his opinion, the one-man, two-truck street car is the solution of the railway problem in Seattle.

Five-Cent Fare Restored in Cleveland

Directors of the Cleveland (Ohio) Railway, at their meeting on July 27, ordered a fare reduction to 5 cents a ride or 5 tickets for 25 cents, to be effective on Aug. 1. This action was taken following receipt of the report of the company's operations for June. This report showed that the interest fund, the fare barometer, contained on July 1 $716,690 or $16,690 in excess of the $700,000 required for a reduction.

City Traction Commissioner James W. Holcomb predicts that within a few months, providing business conditions continue to improve, there will be another fare reduction, next time to eleven tickets for 50 cents.

The directors also at their meeting approved the purchase of fifty new motor cars and fifty trailers for the improvement of service in Cleveland.

Earnings for the company in June showed an increase of 1.54 per cent over the same month a year ago. The company carried 33,554,963 riders in June.

Everett Will Try Motor Buses

City Commissioners of Everett, Wash., and officials of the Puget Sound International Railway & Power Company have under discussion the question of amending the franchise of the company so as to permit it to resort to the use of the trackless trolley or the motor bus in supplying transportation in the future in Everett.

Springfield Returns to Five-Cent Fare

Under a recent order of the Illinois Commerce Commission fares in the city of Springfield will be reduced to 5 cents. The ruling affecting the Illinois Power Company will become effective on Sept. 1. Under the new schedule forty-ride tickets will be sold for $2 or at a 5-cent rate good for the use of any member of the family for the calendar month; school tickets to be used by children over twelve who attend school, thirty tickets for ninety cents or 3 cents a ride; children, six to twelve years old 3 cents cash fare; children under six years free when accompanied by adult; four tokens purchased in car, 25 cents and single cash fares 10 cents. The present cash fare is 7 cents with four tokens for 25 cents or 6¼ cents a ride.

The regular rider benefits by the new arrangement, that is by the use of the forty-ride tickets. Provision is also made for a fifty-ticket book for $2.50 and a sixty-ticket book for $3. The forty, fifty and sixty-ride tickets will be placed on sale at numerous places in the city while the tokens will continue to be sold by all conductors on the cars.

A. D. Mackie, president and general manager of the Illinois Power Company, stated that the experimental order would be given a faithful tryout. He said that the ruling was a fair one in that daily users pay the minimum fare while the intermittent rider pays the higher rate.

Weekly Pass in Use in Tacoma

The weekly pass system is now in use on the railway lines of the Tacoma Railway & Power Company, Tacoma, Wash., having been placed in force July 24. The passes sell for $1, and provide unlimited transferable weekly service. They are on sale on all street cars and at various public places in the city.

Richard T. Sullivan, manager of the company, was permitted to put the system in use without statutory notice, because it was deemed an additional privilege to the riding public. It is believed that by removing the necessity of making changes, issuing transfers, etc., service will be speeded up. The city of Tacoma is the first on the Pacific Coast to install the pass system.

Mayor A. V. Fawcett, who is advocating a straight 5-cent fare for Tacoma, says:

> The weekly pass is not a substitute for a 5-cent fare for the majority of people. Many would pay more than at present under the pass system. The buses will have a weekly pass at $1, too. The buses will soon be giving service on practically all lines in the city. These are the finest buses in the State, and the men operating them know their business.

Ten-Cent Fare Approved

The Indiana Public Service Commission has approved orders establishing a 10-cent fare for city passengers on three interurban lines operating in Indianapolis. The orders became effective on July 1. The companies affected are the Indianapolis & Cincinnati Traction Company, the Terre Haute, Indianapolis & Eastern and the Interstate Public Service Company. The orders are the first to be issued following the suggestions of the citizens' committee for improvement of the financial condition of the Indianapolis Street Railway. The company has been losing several thousand dollars annually in revenue as a result of persons using the interurban cars for city rides. The order is expected to be of benefit to the interurban companies in that it probably will result in relieving congestion on some of the cars caused by a large number of persons using them for city rides.

Selling Transportation to Soldiers

The Portland Railway Light & Power Company operates an interurban line from Portland, Ore. to the United States Army barracks at Vancouver, Wash., which competes with motor bus service between these points. In accordance with the usual custom the credit of enlisted men is good at the post exchange up to a given amount each month. Arrangements have been made by the railway company whereby the post exchange sells interurban tickets, charging the men's accounts when credit is desired. This is said to be a convenience to the men and has resulted in ticket sales through the post exchange amounting to about $250 per month or considerably more than the proportion of the business done by the railway when tickets had to be purchased in the same way from both railway and bus lines. A commission of 7 per cent is allowed the post exchange for handling the business. The railway fare from Vancouver to Portland is 17 cents.

Transportation News Notes

Extension of Seven-Cent Fare Announced.—The United Railways, St. Louis, Mo., has been authorized by the Public Service Commission to extend the 7-cent fare until Dec. 31. The valuation of the company's property which is being made by the commission probably will not be completed before Jan. 1.

Railway Situation Improved.—Regulation of the jitneys in South Bend, Ind., including their elimination from streets on which the electric railway cars operate, has resulted in placing the South Bend electric lines on a paying basis for the first time in many years, according to company officials. With the extensions proposed to the lines to new residence sections, it is probable that the street car business in South Bend may become more profitable.

Hearing on Lower Fare Scheduled.—The question of lower fares on the line of the Boston (Mass.) Elevated Railway will be discussed at a public hearing in the State House on Sept. 18. An announcement to this effect was made at a recent preliminary hearing before the Public Utilities Commission at which nearly 100 people were present including city officials and officials of the Eastern Massachusetts Street Railway and Boston Elevated Railway.

Again Wins Safety Prize.—The safety prize awarded by the Louisville (Ky.) Railway for the smallest number of accidents again goes to the trainmen of the Chestnut Street line. The record of this line for June was 4,500 miles for each accident. This same line captured the May prize. It is the first time since the contest was started some fifteen months ago that one line won the prize twice in succession.

Orders Freight Reduction.—The Public Utilities Commission of Idaho has issued an order authorizing all railroads in the State of Idaho to make a reduction in intrastate freight rates, comparable with the reduction ordered recently by the Interstate Commerce Commission on interstate rates, of 10 per cent, except on hay and grain. The order permits the railroads to make the change on ten days notice. The new rates are effective July 1, 1922.

Riding Habit on the Increase.—A conclusive argument against electric railways outliving their usefulness is given in a recent issue of "*Whys and Other Whys.*" The Public Service Railway, Newark, N. J., in 1904 carried 215,400,000 passengers, an average of 588,525 a day. In 1921 the riders had increased to 435,679,801, an average of 1,193,643 a day more than twice as many. In 1904 the number of rides per inhabitant was 158.6 and in 1921, it was 187.1.

Reduced Rates Announced.—To meet competition with automobile bus lines now operating throughout the State, and especially between Cincinnati and Hamilton Ohio, the Cincinnati, Dayton & Toledo Traction Company has announced a reduction in commuter passenger fares. Rates which have been 2 cents a mile have been reduced to 1½ cents a mile, with special commuter rates between Hamilton and Cincinnati effective from June 1.

Will Oppose Fare Petition.—Preston S. Arkwright, president of the Georgia Railway & Power Company, Atlanta, Ga., has announced that the company will oppose a petition filed before the Georgia Railroad Commission by the Atlanta Board of Education and various parent-teacher associations of the city, requesting the commission to compel the company to reduce fares for school children. The company, which some time ago declined to grant a reduced fare to school children, will oppose the petition on the grounds that such a reduction would be discriminatory. The rate sought is one-half fare, or 3½ cents. The commission will hear the petition on Aug. 8.

Personal Mention

W. F. Tshudy Tranfers to Easton

Walter F. Tshudy, general superintendent of the New Jersey & Pennsylvania Traction Company, Trenton, N. J., and associated companies, has resigned to accept a similar position at Easton, Pa. His resignation was effective Aug. 1. He will be succeeded in Trenton by Charles W. Wilson, night dispatcher of the company. Mr. Tshudy has been in the street railway business for twenty-four years, serving as general superintendent of the New Jersey & Pennsylvania company for the past ten years. He went to Trenton from Newtown, where he had charge of the lines operating between Bristol and Doylestown. He served as dispatcher for the first year and then was advanced to the present position. Prior to going to Newtown he was employed by traction companies in Wilkes-Barre, Philadelphia and Lancaster. Mr. Wilson has been dispatcher for the Trenton company for the past nine years. He has had wide experience in street railroading and prior to going to Trenton was employed by the Philadelphia Rapid Transit Company.

Division Superintendents Named

Several changes in official personnel have been recently announced by the Georgia Railway & Power Company, Atlanta, Ga. W. F. Edwards, superintendent of employment and instruction for some time, has been named assistant superintendent of transportation, succeeding E. C. Grambling. J. J. Duncan, a former instructor, succeeds Mr. Edwards. C. M. Edison, a starter, has been appointed superintendent of Division C, to succeed J. A. Robinson; C. H. Meaders has been appointed superintendent of Division A, to succeed J. R. Leach; F. G. Simpson has been appointed superintendent of Division B, to succeed B. S. Jones. The former superintendents of these divisions have been transferred to other duties.

P. G. Gossler Acting President

P. G. Gossler, who has been chairman of the board of directors of the Columbia Gas & Electric Company, Charleston, W. Va., is now acting as president. This office was previously held by A. B. Leach. Mr. Gossler is president also of the Helena Light & Railway Company, Helena, Mont., and vice-president of the Macon Railway & Light Company, Macon, Ga.

Joseph A. Yager is now receiver, with Harry A. Dunn and J. Frank Johnson, for the Toledo & Western Railroad, Sylvania, Ohio. N. D. Bushong, secretary and treasurer of the company, is also auditor now, this position formerly having been held by H. R. Rondebush. J. W. Anderson, who was acting general freight and passenger agent, is now also traffic manager. W. H. Seed takes the position of acting freight and claim agent. A. H. Blunk, as roadmaster, fills the position previously held by John Knepper. He is also trainmaster.

V. O. Law Succeeds W. O. Clure as General Passenger Agent

Vincent O. Law, St. Paul newspaper man, has been named by President Horace Lowry as general passenger agent for the Twin City Rapid Transit Company, Minneapolis, Minn., succeeding W. O. Clure, who resigned to go to Chicago in February.

In 1915 Mr. Law, who had attended the University of Wisconsin, went to St. Paul as reporter on the *Daily News*. He later was police reporter on the *Dispatch* until he enlisted and went overseas with the Third Field Artillery. While in France he was chosen a member of the party of 160 newspaper men in the army who were taken to various camps, battlefields and fronts and into the Rhine country that they might gain a broad background of the war. He was then chosen to relieve a member of the staff of *Stars and Stripes*. Upon his return to the United States in 1918 he became associated again with the *Dispatch*, as reporter and rewrite man. He began his new work on July 21.

V. O. LAW

Agnes Noon, telephone operator for the Louisville (Ky.) Railway, has been elected to the general committee of the Employees' Co-operative Welfare Association. Miss Noon is the first woman to be elected to this committee, although several of the local committees have women members. As a member of the general committee Miss Noon is eligible for election as director of the company at the annual meeting of stockholders.

Polk Lafoon, who has been for some time secretary and treasurer of the Columbia Gas & Electric Company, Charleston, W. Va., has been elected a vice-president of the company.

James Lawrence, who is auditor of the Muskegon (Mich.) Traction & Lighting Company and auditor and vice-president of the American Light & Traction Company, has been made vice-president of the San Antonio (Tex.) Public Service Company.

Obituary

Colonel B. A. Enloe, chairman of the Tennessee Railroad & Public Utilities Commission at Nashville, died at his home in Nashville recently. For forty years he was prominent in politics in Tennessee and for almost a score of years was a member of the commission. He served in Congress, and was commissioner from Tennessee to the World's Fair at St. Louis. He was at one time editor of a daily paper at Jackson, Tenn.

Charles Butler Holmes, a former president of the American Electric Railway Association, died in Chicago on July 8. He was a leader in the industry through the period of transition from horse-drawn vehicles to cable cars and later to electric cars. As president of the Chicago City Railway, which in 1887 was operating 130 miles of track and more than 800 cars, he was instrumental in replacing the horse cars with cable cars. To advocate this method at that time took courage and vision. His presidency of the American Street Railway Association, as the national organization of street railway men was then known, was from 1887 to 1888. Mr. Holmes was a native of Vermont.

Frank W. Frueauff, junior member of the firm of Henry L. Doherty & Company, New York, N. Y., and vice-president of the Cities Service Company, died suddenly at his home in New York City on July 31. He was a partner in the Doherty company from its organization in 1905, and was especially interested in public relations. Under the direction of Mr. Frueauff the Cities Service Company, a Doherty holding corporation, increased its business in a few years from $1,000,000 to $100,000,000. Before joining in the formation of the Doherty company, Mr. Frueauff was president of the Denver Gas & Electric Light Company. He had served as meter reader of the Denver Consolidated Electric Company in 1899, and served in various capacities, including those of secretary, vice-president, and general manager, after its consolidation with the Denver Consolidated Gas Company into the Denver Gas & Electric Light Company. This change was effected by Henry L. Doherty, who was president of the company preceding Mr. Frueauff.

Manufactures and the Markets

DISCUSSIONS OF MARKET AND TRADE CONDITIONS FOR THE MANUFACTURER, SALESMAN AND PURCHASING AGENT

ROLLING STOCK PURCHASES · BUSINESS ANNOUNCEMENTS

Car Loading Still Heavy

Reports received by the Car Service Division of the American Railway Association from the carriers of the country show that despite the railway strike the total loading of all commodities, other than coal, during the week which ended on July 22, was the heaviest for this season of the year of any in the history of the carriers, and within nine-tenths of 1 per cent of the peak of October 15, 1920.

During that week 861,124 cars were loaded with revenue freight, an increase of 217 cars over the preceding week and an increase of 73,090 cars over the corresponding week last year. Grain and grain products totaled 57,566 cars, an increase of 8,655 cars over the previous week. This was a decrease of 7,149 cars compared with the corresponding week last year, but an increase of 22,089 cars over the corresponding week in 1920. Loadings for the week, however, were the highest since the week of September 3, 1921.

Coal loadings totaled 76,060 cars, a reduction 1,274 cars under the previous week. Compared with the same week last year this was a decrease of 73,745 cars, and with the same week two years ago a decrease of 125,530 cars. Coke loadings amounted to 9,949 cars, a gain of 251 cars over the preceding week. It also was an increase of 6,179 over the same week last year, but 3,178 below two years ago.

Merchandise and miscellaneous freight, which includes manufactured products, totaled 567,165 cars, 300 cars less than the week before. This exceeded the corresponding week last year by 98,342 cars, and the corresponding week in 1920 by 50,480 cars.

Coal Shortage in Northwest Serious

The steadying influence of the government on the price and distribution of coal is now making itself felt. Production is again on the increase as the tangles caused by the rail strike are being straightened out. The Geological Survey estimates the output last week at 3,900,000 tons, a gain of 200,000 tons, or 5 per cent over the previous week. This increase came mainly from the non-union fields in the South, but Pennsylvania contributed some.

Prices continue strong. *Coal Age* Index of spot prices of bituminous coal at the mines rose 96 points to 556 on July 31. This corresponds to an average spot price of $6.73. Prices on Western coals, particularly those from Kentucky, declined with the collapse of the boom on the Chicago market a week ago. Cincinnati, Columbus, Cleveland and Boston were the most active markets as the week opened.

Washington's machinery for handling the details of distribution is in the making and the control over prices is yet but a moral influence. The structure is being built from the top down, but it is being well built, extending into the states and cities through the co-operation of state commissions and local fuel administrators. Secretary Hoover is getting ready to meet a situation that is more than transient, a shortage that is yet to be fully felt and that will not be over until next spring.

The railroads are the only consumers that have found it necessary so far to take advantage of the priority orders—the Pennsylvania is taking 20 per cent of output on its lines. These orders were primarily for their protection and they are now using them to get coal. Where the roads demand the coal, shippers are letting them have it below the market rather than have it confiscated.

Buying of British coal has abated somewhat, mainly because both coal and ships have become scarce if wanted for immediate delivery and because prices advanced sharply. Whereas two weeks ago English coal could be had c.i.f. New York for around $7.50, it is now obtainable for late August and September delivery at around $10.

A survey just completed by officials in Washington of the Lake coal situation indicates that it is physically possible to move enough coal to give the Northwest reasonable supplies if the Lake movement is begun by Sept. 1. Such a program, however, presupposes full co-operation on the part of ship owners and that there will be no delays to vessels in obtaining coal for loading at the lower ports. Car and coal shortages have lowered the Lake dumpings. The needs of the Northwest are fast becoming urgent and a few weeks more delay will spell a certain coal famine for that section next winter.

Public Service Railway Has Ample Coal Supply

A recent announcement by officials of the Public Service Corporation, of New Jersey, states that its subsidiaries have ample supplies of coal. Operations could be continued at least for three months even if not another ton of coal were received. Public Service Gas Company and Public Service Electric Company are large consumers of coal, using about 2,000,000 tons annually. The traction subsidiary gets its power from the electric subsidiary.

In anticipation of a strike, company began to accumulate large stocks as far back as last winter and has recently been augmenting its supplies by shipments of English and Welsh coal.

1,250,000 Men Idle Through Strikes

According to the National Industrial Conference Board, there are approximately 1,250,000 persons in the United

ELECTRIC RAILWAY MATERIAL PRICES—AUG. 1, 1922

Metals—New York

Copper, electrolytic, cents per lb	13.975
Lead, cents per lb	5.775

Gravel, ¾-in., cu.yd., N. Y	1.75
Sand, cu.yd., N. Y	1.00

Old Metals—New York

Heavy copper, cents per lb	11.25
Light copper, cents per lb	9.00
Heavy brass, cents per lb	6.25
Zinc, old scrap, cents per lb	3.25
Yellow brass, cents per lb (heavy)	6.50
Lead, heavy, cents per lb	4.50
Steel car axles, Chicago, net ton	$17.00
Old car wheels, Chicago, gross ton	19.75
Rails (short), Chicago, gross ton	17.75
Rails (relaying), Chicago, gross ton	25.00
Machine turnings, Chicago, gross ton	8.75

States out of employment as the direct result of strikes. The board calculates that this represents the loss of 10,000-000 man hours of work daily.

In reviewing the situation, the Board says:

"With each day that this strike condition exists, more and more persons engaged in secondary or allied industries, which are dependent on the major industries, are thrown into involuntary unemployment, thereby imposing an additional burden on the community."

Rolling Stock

British Columbia Electric Railway, Vancouver, B. C., has added ten more cars to its equipment. The cars came from Victoria and were replaced there by ten new safety cars.

Kentucky Traction & Terminal Company, Lexington, Ky., announces under date of July 26 that it has just closed a contract with the Cincinnati Car Company for the purchase of two light weight freight cars—length 40 ft., motor equipment 25 hp.

Cleveland (Ohio) Railway announces that at a meeting of the directors July 27 approval was given for the purchase of fifty new motor cars and fifty trailers for increasing service in Cleveland. It is understood that bids have been asked from the McGuire Cummings and Kuhlman Car Companies for motor cars of the Peter Witt type. It is stated, however, that if the bids are found too high the company may decide to build the cars in its own shops.

Track and Roadway

Omaha & Council Bluffs Street Railway, Omaha, Neb., has awarded the contract for the widening and double-tracking of the toll bridge connecting Omaha in Nebraska and Council Bluffs in Iowa.

Trenton & Mercer County Traction Company, Trenton, N. J., is having double tracks laid on Pennington Avenue and the ties are being "treated" along the thoroughfare. The improvement will mean the saving of time for the company.

Los Angeles (Cal.) Railway is to reduce the west span of the Macy Street bridge from 154 ft. to 100 ft. according to B. H. Eaton, engineer of way and structures. This work will strengthen the bridge.

San Diego (Cal.) Railway, through President Speckels, has announced the sending out of orders for materials for reconstruction of the University Avenue line of the company and the work is to be started about Sept. 1. The line is to be reconstructed from Park Boulevard, San Diego, to the end of the line in East San Diego, involving the laying of about four miles of track. Twin steel ties laid in concrete and 93-lb. rails will be used. The estimated cost of the work is $350,000.

Portland Railway, Light & Power Company, Portland, Ore., under a proposed franchise will install tracks in the middle of Foster Road instead of at one side as at present. Passage of a franchise for the operation of street cars in Foster Road was favored by members of the City Council recently, when copies of the ordinance were ordered advertised for the required sixty-day period. The company has been operating its cars in Foster Road over a private right of way, which was relinquished to the city when plans were drawn for this improvement.

Shops and Buildings

Charlottesville & Albemarle Railway, Charlottesville, Va., is now asking for bids and expects to install one 1500 kw. horizontal 2300 v. steam turbine with condenser and switch-board equipment.

Los Angeles (Cal.) Railway has overhauled eighty-two transformers for motor generator sets in substations with the oil filtered and the water coils cleaned. The work was completed in four months.

Boston, Mass.—Engineers of the Boston Transit Department have sent a plan to the Boston (Mass.) Elevated Railway for relieving the overcrowding at the Park Street station of the Tremont Street Subway. The plan provides for the building of an additional platform on the easterly side of the north bound track. The proposed platform would probably cost about $250,000.

Portland Railway, Light & Power Company, Portland, Ore., through C. M. Clark of Philadelphia, chairman of the Board of Directors, states that more money will be available this year for improvements than for some time. The new development of the projected Three Links Station at the Oak Grove site on the Clackamas River was recently inspected. Preliminary construction work will start about October. There will follow a long term of construction of the reservoir, power house and pipe lines and it will probably be 1924 before the new station is placed in operation.

Trade Notes

The Supply Men's Association will meet jointly with the Chief Interchange Car Inspectors' and Car Foremen's Association of America at the Sherman Hotel, Chicago, Aug. 22, 23, and 24. Exhibits will also be held.

The Safety Car Heating & Lighting Company, New York, N. Y., is completing plans for the construction of a one-story 106 x 115 ft. brick and steel addition to its works at Hamden, Conn., and also for the erection of a new battery plate production building, one-story high and 194 x 100 ft. of brick and steel.

The Associated Engineers, Milwaukee, Wis., announce that they will move to larger quarters at 373 Broadway, Milwaukee, on or about Aug. 1.

Railway Audit & Inspection Co., Inc., Philadelphia, Pa., announces the appointment of C. H. G. Larrimore as general manager in charge of all operations, vice T. C. Cary, deceased.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., recently held its annual meeting of the sales managers of the various departments of the company and of the various district officers at Lakewood, N. J. H. D. Shute, vice-president of the company, presided.

Conveyors' Corporation of America, Chicago, has appointed the Mid-West Engineering Sales Company, Masonic Temple, Cedar Rapids, Iowa, as representatives in eastern Iowa for the sale of American trolley carriers, which are coal-handling equipment of the monorail type.

Johns-Pratt Company, Hartford, Conn., whose selling arrangements through Johns-Manville, Inc., were recently dissolved by mutual consent, have established a Boston office at 161 Summer Street, which is in charge of Daniel Fitts and Harold E. Morse. It is intended to have complete representation at this office for the following products of the company: Noark fuses, meter protective devices and moulded products.

New Advertising Literature

Crouse-Hinds Company, Syracuse, N. Y., has just issued catalogs on panel boards, knife switches, radial switches, harpoon guy anchors, projectors and reflectors.

Westinghouse Electric & Manufacturing Company has reprinted an article by Prof. Chas. F. Scott of Yale University on "The Question of Inductive Interference and Electrolysis as Related to Railroad Electrification." It reviews the experience along these lines of several railroads having electrified sections, with particular reference to single-phase electrification.

The McAlear Manufacturing Company, Chicago, Ill., has ready for distribution a new 128-page catalogue, known as No. 27, which illustrates many new devices, including an individual temperature control valve, specialties for all power plants, vacuum and vapor heating systems, oil refining and water works plants, plumbing systems and marine service, together with illustrations showing their application and use. The individual temperature control valve is self contained and can be applied to any radiator, old or new, without additional piping other than the supply and return. When the thermostatic member is set for the desired room temperature, it automatically controls the opening and closing of the valve. The catalogue describes all the specialties of the company.

Volume 60 New York, Saturday, August 12, 1922 *Number* 7

Individual Labor Agreements More Practical than National Ones

DURING the last ten years the electric railway industry has sounded the depths of tribulation. When the costs of operation went up by leaps and bounds, adequate increases in fares were not permitted. The companies have been harassed by unfair jitney competition, burdened with inequitable taxes and frequently made the football of politics. But one burden they have been spared. There has been no national labor agreement. This has been a good thing for the companies, for the men and for the public.

During the past four months one of the important and necessary utilities of the country has been paralyzed and another threatened because of national agreements. Numerous conferences have been held, federal and state authorities have endeavored to assist in the bringing about of a settlement, and the continued progress of industry and commerce has been threatened with interruption. A national agreement for any industry does not take into consideration the great differences in living conditions which exist in various parts of the country. What would be a hardship in wages and working conditions in one part of the country might easily be very satisfactory in another part. Moreover, if industrial relations become mutually satisfactory on one property, they should not be forced artificially to remain strained because others at a distant point cannot agree on what is best to do. This practice on electric railways of individual labor agreements should be borne in mind with any consideration of electric railway securities as investments.

The Coal Situation Requires Close Attention

THE Federal Fuel Distributor has now completed his organization and in order to co-operate with the government, the American Electric Railway Association has combined with the National Electric Light Association and the American Gas Association in the appointment of an executive representative at Washington to handle coal matters. This is one of the ways in which the association is endeavoring to look out for the requirements essential to uninterrupted operation of the electric railways.

It is evident that John Lewis has scored a triumph by keeping his forces intact through the summer until the public necessity for coal has made a resumption of work imperative. For the general situation is becoming alarming, though at the moment the electric railways do not seem to be in imminent danger of a shut down from lack of coal. The present situation in the coal strike seems to be that of marking time while results from the Cleveland conference are awaited. The plan of settlement being discussed includes the resumption of operation by mine workers and operators on a status quo basis under the conditions of March 31, 1922. It is planned that by Oct. 31 an advisory committee is to be elected, composed equally of operators and miners, which committee is to make a complete investigation of the coal situation and report its recommendations as to the best way to conclude future wage scales, etc. This committee, it is understood, is designed to take the place of the commission that President Harding has been proposing to accomplish the same ends. The difference would be that in the one case the entire matter would be retained within the industry and in the other the government would be a party.

Coal stocks are now lowered to a point where close co-operation by all utilities is necessary in order to prevent closing down of service. The appointment of the Washington representative should do much to speed up the various operations necessary in order to secure prompt assignment and delivery. His services should be freely used by the electric railways if their local situation becomes acute.

Advance in Underfeed Stoker Design

THE pioneer installation of a new design of underfeed stoker for burning Northern Illinois, high-ash, clinkering coal recently completed its first year of service in the power plant of the Twin City Rapid Transit Company, Minneapolis, Minn. During this time it has successfully performed the service for which it was designed—an accomplishment of considerable credit to the originator, E. H. Scofield, who evolved the special features that adapt an ordinary underfeed stoker for the combustion of fuel having clinkering tendencies.

The stoker is described elsewhere in this issue. Two factors were recognized as prerequisites in obtaining fuel-bed conditions which would minimize the undesirable characteristics of this coal. The first of these, a slightly agitated and uniformly progressive fire bed, was brought about by the addition of a secondary ram to each retort. By the action of these rams the force for advancing the burning fuel is applied at two points along the fire bed instead of one, with a consequent reduction in disturbance to fuel, the clinkering tendency of which is aggravated by excessive agitation. The other beneficial condition is a low fuel-bed temperature. This was provided in the design of the setting by creating circumstances particularly favorable to a high heat absorption directly from the fuel by the exposed boiler heating surface.

In considering the results accomplished in the latest design, due credit must be accorded the working out of boiler and stoker installation as a unit. In other words, beneficial furnace and boiler conditions contribute materially to the high average efficiency of 70 per cent which has been obtained in Minneapolis. This performance is exceptional with coal averaging 9,500 B.t.u. per pound. It is difficult, of course, to determine what part of the increase in efficiency over the old installation can be credited to the stoker and what to the redesigned boiler setting and baffling. But the value of the co-ordination between the two is evident.

A solution of the problem of burning low-grade clinkering coal in underfeed stokers would put fuel of this variety on a basis comparable with high-grade coals in respect to the high rates of combustion possible and the satisfactory behavior of the fuel while burning. This would mean a distinct saving in energy costs to generating companies in the clinkering coal regions. That power plant engineers have been awaiting equipment which could do this seems to be demonstrated by the fact that a number of installations of this type of stoker are now under way in the territory where fuel having high percentages of moisture, ash and sulphur prevails. These installations are based on the excellent performances of the Twin City plant.

The Six-Day Traction Strike in Chicago

AFTER the longest complete tie-up of both elevated and surface lines ever experienced in Chicago the trainmen have won a wage 7 cents an hour higher than is paid any other surface electric railway employees in the country. They also retain the eight-hour day. Yet Mr. Blair was severely criticized locally for his alleged unwillingness to concede a point here to gain a point there. In the end it was he who conceded nearly everything. There was a conspicuous absence during the negotiations of evidence showing why a 65-cent scale, the company's initial compromise offer, was not a fair wage. The union officials side-stepped the fair living wage issue. They pointed repeatedly to the magnitude of the 15 cent reduction. It meant $8 to $10 a week to each trainman, which would be quite a sum to lose at one cut. Had the 15-cent reduction been arrived at by small steps begun earlier it might have seemed less formidable to the men.

The trainmen ignored the fact that a street railway must be conducted on a business basis. Mr. Blair showed from the first forty-five days' operation under the 7-cent fare that the 1-cent reduction from 8 cents had caused a $17,300 decrease in daily revenue—equivalent to about $6,300,000 a year. The wage reduction will absorb only about $4,000,000 of this. If there is to be any profit in the business, therefore, the company will have to find ways and means of making large operating economies. Substantial savings are not impossible provided the co-operation of the trainmen is had. Having won so liberal a wage settlement the men should be in the frame of mind and have the good sense to agree wholeheartedly to plans for better operation that will possibly enable the company to continue the present scale without bankruptcy.

The situation of the elevated railway employees in this strike was unique. They had no quarrel with the management. No contract existed, as the previous contracts, Surface and "L," had expired on June 1, 1922. There was no plan on foot to cut wages as long as the present rate of fare prevailed. But to make an issue for standing with the surface lines union, the elevated union demanded that the company sign up for a year at the old 82-cent rate. Of course this could not be done. A small meeting stormed by strike advocates precipitated a strike simultaneous with the surface strike. The outcome of the strike was an agreement on a new wage 10 cents an hour lower. The men hastened a cut in their own wages by striking. They deserved to suffer the reduction at once. But President Britton I. Budd ignored their poor judgment and continued the 82-cent rate until such time as the fare is cut by the Illinois Commerce Commission. This evidences a consideration for the viewpoint of the employees that is too seldom seen. It accounts in part for the unusually high morale on the Chicago Elevated Railroads and on the Chicago, North Shore & Milwaukee Railroad.

Putting It Up to the Surface Lines

NO ORDERS will be issued by the New York Transit Commission fixing standards of service for the surface lines of Greater New York. Responsibility for improved service on these lines will be placed primarily with the operators, with the commission maintaining regulatory supervision. This is the decision of the commission following its inquiry into the conditions affecting the surface lines and is in accordance with the suggestion made to the commission by Gen. Lincoln C. Andrews, chief executive officer. Representatives of the sixteen companies who appeared before the commission on Aug. 3 have agreed on their part to meet with the members of the commission once a month with a view to exchanging ideas and suggestions looking to a general improvement in equipment, plant and schedules.

Here is an instance of frank recognition by a public regulatory body of the adverse conditions under which surface railways have operated during the war-time period and of the efforts that are now being made to restore the physical properties to something like their normal state. Conditions were particularly unfortunate for the surface companies in New York City in that many of them were cast adrift from the properties of which they were formerly a part and that none of them was permitted to increase its fares, except as an increase resulted indirectly from dismemberment and the curtailment of transfer rights to the passengers. The surface lines in New York survived at all only because of economies which were put into effect that for the most part resulted in deterioration of the physical properties and at the same time—necessarily so—worked to the detriment of the traveling public. During the last year, however, within the limits of their financial condition, the companies have materially improved their efficiency of operation. This the commission knows to be the fact, while the change for the better is also readily apparent to the riding public in the shape of better service and in fewer decrepit cars.

The attitude of the commission is that by interfering least with the companies it is helping them most in working out their own salvation. As General Andrews expressed it, the commission may be expected to secure far better service for the public from the surface companies by leaving the responsibility upon the operator and holding him to it than by issuing orders. The commission is, of course, in a position to judge from its records what the financial conditions of the companies will permit them reasonably to do and to determine for itself as a guide proper standards of service to be met by progressive steps as rapidly as the condition of each company permits. Thus are the companies really put on their mettle.

The Underfeed Stoker Successfully Burns Low-Grade Fuel

High-Ash, Clinkering Coal Burned in Specially Designed Underfeed Stokers in Twin City Plant — Operation Featured by Flexibility, High Efficiency, Capacities Up to 350 per Cent, Uniform Thickness of Fuel Bed and Minimum Clinker Formation

OVER a year ago the Twin City Rapid Transit Company, Minneapolis, Minn., installed underfeed stokers under six 5,560-sq.ft. B. & W. boilers in its steam station located at Sixth Avenue, S.E. and the Mississippi River. These stokers replaced six of the chain grates with which all twenty-eight boilers in the station up to that time had been equipped. The requirements were severe in both capacity and efficiency incident to the demands of a station feeding a widely fluctuating electric railway load. The load characteristics of this plant are still further aggravated by its interconnection with several hydro-electric plants which are kept loaded always to the limit of the water available. The older installation left considerable to be desired in the way of flexibility and economy in addition to being handicapped by a power demand varying between extreme limits and a clinkering fuel of low grade, high in ash, moisture and sulphur. When it was decided several years ago that the performance of the plant must be bettered, doubt was expressed at the possibility of accomplishing such a result with any type of underfeed stoker then designed or in operation, in the belief that the problem of continuous and satisfactory combustion of coals with high percentages of ash, moisture and sulphur had never been completely solved. The working out of these difficulties in the Twin City plant during the past four years has culminated in the use of a specially designed stoker and the redesigning of the boiler setting.

Each of the six installations consists of a Westinghouse six-retort stoker, 10 ft. 8¼ in. in width and 10 ft. ⅞ in. from front wall to bridge wall. The front is set flush with the boiler front, thus eliminating all overhanging brickwork. No ignition arches are used. As the bottoms of the front tube headers are only 8 ft. above the floor line, it was necessary to set the stokers

3 ft. below the floor level to secure the desired furnace volume of about 1,300 cu.ft. Each boiler is a thirteen-tube-high, twenty-one-tube-wide, parallel drum, 5,560-sq.ft. B. & W. unit, having 900 sq.ft. of superheater surface but no economizer. The steam conditions at which the boilers work are 190 lb. per square inch pressure and 100 deg. F. superheat at nominal rating. An accompanying illustration shows the general scheme of the stoker setting and the boiler baffling.

FUEL BED CONTROLLED WITH SECONDARY RAMS

In the working out of the stoker design, several most desirable features were originated to meet the conditions required for the proper burning of Northern Illinois coal. The fuel, as it is introduced from the retorts by the rams, is spread laterally by deflector plates so as to cover the surface of the tuyeres. The action of these plates also loosens the fuel, which, when containing large percentages of moisture and dirt, becomes densely packed under the action of the rams. Secondary step-shaped rams, located midway between the deflector plates and the grate tuyeres, insure a continuous movement of the fuel bed. These rams, under independent control, extend in their action practically to the dump grate, filling in blowholes which may start and also building up the fuel bed to a uniform thickness. Thus the auxiliary rams furnish means for controlling the distribution of coal over the fuel bed and for agitating slightly the lower fuel bed. At the same time all grate surface is made effective for combustion. Thus it is seen that a fuel bed of uniform thickness is made to travel steadily toward the rear with suitable agitation. In practice the stoker has been found to maintain these conditions, an accomplishment to which are credited the beneficial combustion conditions.

SECONDARY RAM ADJUSTMENT

Each secondary ram is driven by its individual feed ram, although the length of stroke of all secondary rams is regulated by one adjustment lever shown in one of the accompanying illustrations. On the upper end of the auxiliary ram driving rod is a block with four notches which is engaged by a pin driven through a fixed stroke by a series of links from the primary ram. According to which of the four notches the pin engages, the lost motion of the link movement is taken

up so as to vary the stroke of the secondary ram from zero to 6 in. The control of the lost motion is effected by the use of a selector block, which slides under the pin and prevents it from engaging any but the desired notch. The details of this construction are shown in an illustration.

Another refinement required was the use of extension side wall tuyeres, which extend approximately to the top of the fuel bed. They are so designed that there are no dead pockets for the lodgment of partially burned coal or clinkers and they protect the walls from the direct heat of the fuel bed and prevent clinkers from forming on the side walls. Both the side-wall tuyeres and front-wall air boxes admit a limited amount of air underneath and near the surface of the fuel bed, tempering the gases and forming a cool blanket over the lower furnace walls. The reduced temperature in that region is helpful in protecting the brickwork. A battery of high-velocity steam jets, placed in the front wall about 18 in. above the fuel bed surface and directed parallel to that surface, insures complete combustion by thoroughly mixing the gases before they enter the tubes. These jets also divert the gas flow toward the back wall of the furnace, providing for a sweep of the gases over the full length of the exposed boiler tubes.

Two sets of dump grates are provided for emptying the ashes into the ashpits. One of these is hinged to the lower end of the stoker and the other to the rear wall support. Each is actuated by an individual steam ram located on the outside of the boiler setting. The stroke of these rams can be controlled by the setting of a collar located on the piston. The front dump grate, by its lifting action, may be used to break up clinkers as they pass to the rear dump and also to hold back the fuel bed when the rear dump is dropped. Air for combustion is supplied under control to both front and rear dump grates. This auxiliary air supply enters through a duct inclosed in one of the steel members that support the lower end of the bridge wall. The entire grate surface thus becomes active when required and the carbon is burned down to a low percentage of the refuse before dumping. Also ashes may be dumped frequently on heavy loads without interfering with the output or efficiency and refuse is disposed of before it builds up into large clinkers.

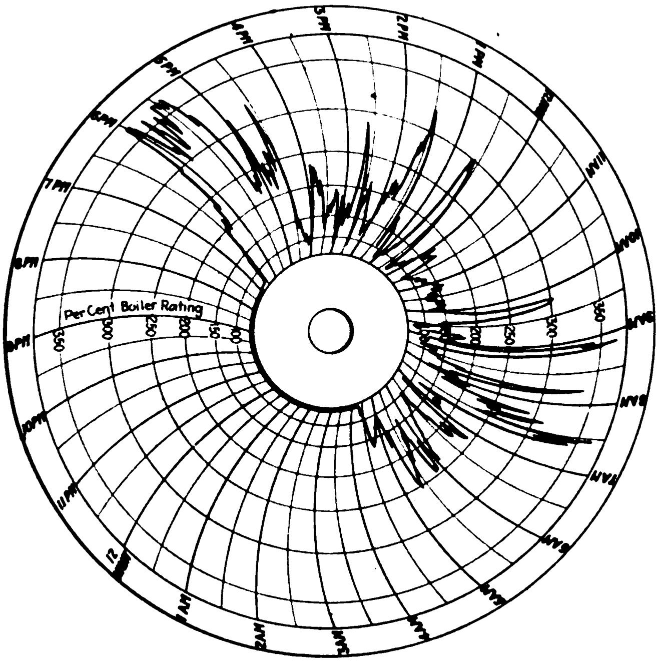
Baffling Gives Uniform Gas Velocity and Exposes Lower Tubes to Radiation

With the installation of the underfeed stokers special baffling was designed to give a cross-section of passage through the boiler approximately proportional to the volume of the gases. In other words, practically a constant gas velocity is established by decreasing the cross-section of the passes in the same ratio that the gases contract due to the abstraction of the heat by the tubes.

The bridge wall and baffling are so located as to expose 90 per cent of the tube length, giving a tube area double that of the grate to absorb heat by the direct radiation from the fire. The bridge wall rises from the dump grate to a level with the surface of the rear of the fuel bed and then recedes to the rear, meeting the tubes at the back end of the boiler. With this condition of tube exposure it is estimated that more than 50 per cent of the total heat is absorbed in the first two rows of tubes. The high heat absorption directly by radiation accounts largely for the low furnace temperature and consequently a minimum of clinker formation. The ashes as they are raked from the ash pit contain only lumps of moderate size. That this should be so is highly important because before dropping onto the bucket conveyor the ashes must pass through an 8x8-in. cast-iron grid.

If it resulted in excessive clinkering this system would be objectionable because the refuse would have to be reduced to the proper size before it could be handled in the conveyor.

In connection with the design of the furnace it might well be mentioned that the angles of the stoker, the front wall and the bridge wall are so arranged that the radiant heat which does not enter the tube surface directly reaches the boiler with but one reflection. Such a condition means that the maintenance of furnace walls and other brickwork is considerably lowered by the elimination of double and triple reflections. After eighteen months' operation the furnace settings have received no repairs of brick linings and there is practically no accumulation of slag on the walls.



STEAM FLOW CHART SHOWING WIDELY FLUCTUATING LOADS

SUPERHEATER SURFACE INCREASED

Because of the large proportion of heat absorbed directly from the fuel bed by the first two rows of tubes and because of the redesigned baffling, it was thought that the area of the old superheaters would be insufficient to maintain the required degree of superheat. Under the new conditions it was estimated that the temperature of the gases as they entered the second pass would be considerably lower than formerly. The superheater, consequently, was lengthened so that the bends extended over the first pass instead merely of just up to the first baffle. This gives the effect of a double-pass superheater. Its area was increased from 550 to 900 sq.ft. by this extension to insure that at least the same superheat would result. With the boiler operating at about 170 per cent of rating the superheat formerly averaged about 100 deg. F. An accompanying chart shows how it was increased to 140 deg. F. at this rating and also how it continued to increase as the boiler was forced to higher ratings.

In connection with the redesigning of the superheater, an improvement in the construction of the rear baffle was worked out which made it unnecessary to utilize the superheater headers to support the baffle tile. Instead of baffle tile in that position, between the lower superheater headers and the boiler drums, ½-in. transite board has been used. It is secured between two "L" holders, the upper one being hung from ⅞-in. rods passing over the boiler drums. The lower one is built into the section of tile baffling resting on the upper rows of boiler tubes. Seven sections, 21 in. x 4 ft., are required per boiler, each section being reinforced vertically with an angle and a channel. The advantage of this type of construction is that the baffling is readily removable and that it is independent of the expansion and contraction of the superheater risers.

Experience with this equipment has demonstrated the possibility of operating throughout a range from 100 to 350 per cent of rating, as will be noted on the boiler record chart. At the higher rating low-grade fuel is burned at a rate of 1 ton per retort per hour and the refuse is disposed of with no excessive loss of carbon or loss of capacity or efficiency while dumping. Whether or not this high rating is the limit of the stoker capacity has not yet been determined, for the rate of evaporation was limited by the capacity of the feed pipes and the feed line to furnish the boiler with water.

This design of stoker and furnace has demonstrated other advantages. It is possible to control the air supply to the most efficient proportions, little if any slag is formed on the furnace wall and highest efficiency is secured at or near normal rating. The stoker maintenance has been low and the percentage of combustible in the ash has been reduced to a negligible proportion.

The performance of this equipment is shown in accompanying curves. The data were obtained from a series of twelve tests, at outputs ranging from 100 to 350 per cent of rating, conducted under the direction of E. H. Scofield, engineer of power, by representatives of the Westinghouse Electric & Manufacturing Company and of the Twin City Rapid Transit Company. The fuel characteristics and operating conditions varied as outlined in the following tabulation, the result of each test being reduced to a basis of conditions shown in the third column:

	Minimum	Maximum	Curve Basis
Coal:			
Moisture, per cent	14	20	18
Ash, per cent	16	22	18
Sulphur, per cent	3.5	5	4
Volatile, per cent	32	35	33
Fixed carbon, per cent	45	48	45
Ash fused at, deg. F.	.....	.....	2,100
B.t.u., commercial, per pound	8,827	9,750	9,550
B.t.u. dry	.....	.....	11,650
B.t.u. combustible	.....	.....	14,200
CO_2 at top of third pass, per cent	13.5	15.5	14–15
Carbon in refuse, per cent	13.0	20.0	15–20
Uptake temperature, deg. F.	415	740	400–750

While the efficiencies on test range from 77 per cent at nominal rating down to 60 per cent at 350 per cent, the average operating economy is placed at about 70 per cent. Considering the wide and sudden variations in load and the character of the fuel, this performance is considered excellent. It may be compared to an average of 60 per cent for the older installation.

That considerably better results can be expected with a higher grade of fuel was indicated by four tests made at loads ranging from 200 to 275 per cent of rating with Harrisburg screenings of the analysis shown in the following table:

ANALYSIS OF HARRISBURG SCREENINGS

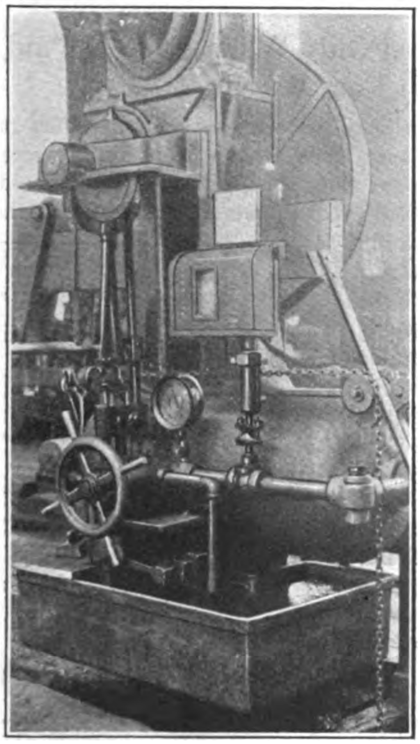
	Per Cent
Combustible	77.87
Moisture	9.90
Ash	12.23
Volatile—dry coal	29.48
Fixed carbon	54.11
Sulphur	2.81
Ash	13.60
B.t.u.—commercial, per pound	11,304
B.t.u.—dry coal	12,541
B.t.u.—combustible	14,514

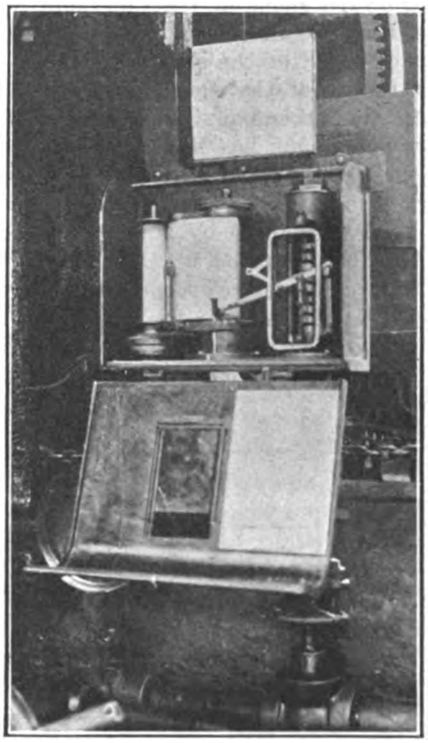
During the twelve tests no large clinkers were formed at any time, no slice-bar work was required on either side wall or bridge wall and no slag formed on the furnace walls or boiler tubes. The dumping periods were frequent and there was no appreciable drop in the percentage of CO_2 or in the steam flow. Such furnace conditions provide a unit of great flexibility peculiarly adapted to stand-by and to intermittent demands and to meet the most exacting requirements of railway and power loads. They also reduce the banking losses to the low figure of 250 lb. per boiler per hour.

Insuring Proper Wheel Mounting

HOW many electric railway men in whose shops wheels are being continually mounted have the assurance that the job is being properly done? P. V. C. See, superintendent of equipment Northern Ohio Traction & Light Company, Akron, Ohio, has learned by experience that the final pressure on the ram of a wheel press as shown by the gage is not a positive indication that sufficient contact pressure exists between the axle and the wheel to prevent its coming loose. To eliminate the uncertainty accompanying this work by knowing the value of the applied pressure during the whole operation of mounting a wheel, he has equipped his wheel press with an instrument working on the same principle as a steam engine indicator. The instrument, which is connected to the main oil feed line from the pump to the ram cylinder, is known as a hydraulagraph and is manufactured by the American Steam Gage & Valve Manufacturing Company, Boston. The hydraulic pressure acting on the ram operates the piston in the cylinder, which, in Fig. 1, will be noticed just beneath the instrument. This piston, moving against a spiral spring, actuates the pen gear which is attached to the piston rod through a system of levers. The chart is a continuous strip of paper, which is advanced from one spool to another by the movement of the ram itself. The connection to the instrument is made with a cable attached to the ram counterweight. Through the use of a ratchet device the chart is moved forward only during the working stroke of the ram and a reducing motion limits the chart advance each time to but a fraction of the ram travel. The result of the combined pen and chart motions is a diagram showing the curve of the pressure applied to the wheel with relation to the distance it has been pressed onto the axle.

The customary rule used in mounting wheels is to apply a final pressure of 10 tons per inch of axle diameter, assuming, of course that this pressure is built up uniformly during the mounting operation, that is, proportional to the area of the two surfaces in contact. Should either the axle be machined with a slight taper or the wheel bore be larger at one end than at the other, the required final pressure may be attained, not uniformly but rapidly during the last portion of the ram travel. In other words, a contact with the axle is not established along the total bore of the wheel, but only at the point of its minimum diameter. Such a fit is unsafe since a blow and not a sustained pressure is required to loosen the wheel. The curve showing the pressure cycle occurring during the mounting of a wheel when either

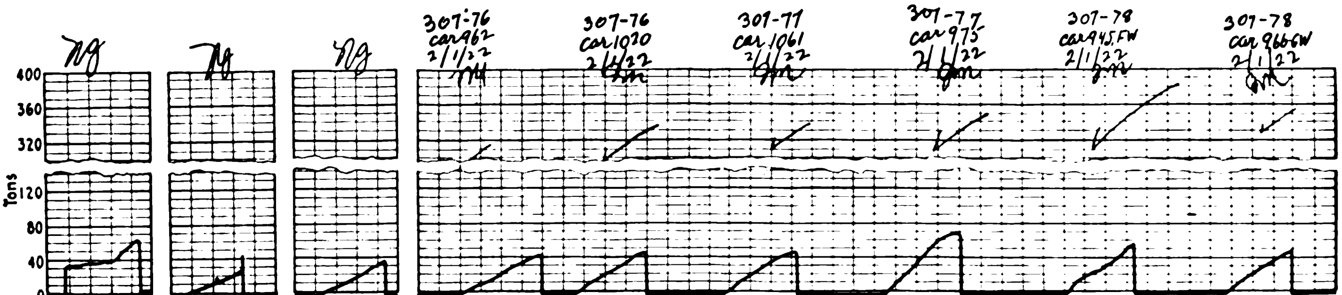




AT LEFT, A HYDRAULAGRAPH MOUNTED ON A WHEEL PRESS IN THE SHOPS OF THE NORTHERN OHIO TRACTION & LIGHT COMPANY

AT RIGHT, THE HYDRAULAGRAPH OPERATES ON THE SAME PRINCIPLE AS THE STEAM ENGINE INDICATOR

BELOW, TYPICAL SECTIONS FROM THE GRAPHIC WHEEL PRESS RECORD CHART



the axle surface or the wheel bore was tapered is marked *A* on the reproduction of a chart taken from the instrument. Curve *B* resulted from a case when the wheel-fit was too loose, the final pressure being caused by the wheel hub coming in contact with the axle shoulder. In such an instance there is insufficient contact pressure to permit the wheel and axle to be put in service. Curve *C* reveals a similar condition, that is, when the axle and wheel bore have uniform diameters but the fit is not tight enough.

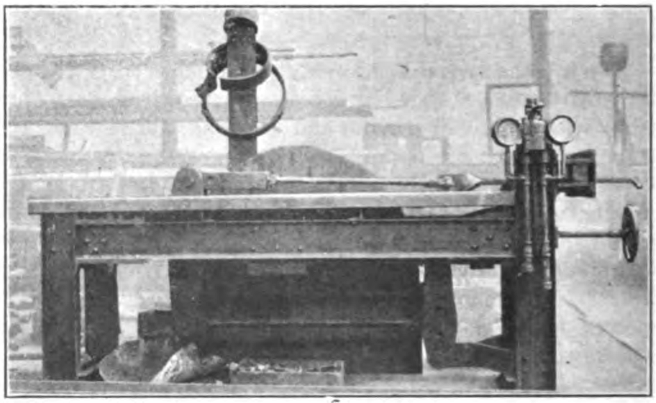
When this hydraulagraph was first installed the chart showed too many cases of faulty wheel mounting due to inaccurate machine work. The workmen now exercise more care in this respect, for they know that if there is a taper of more than 0.002 of an inch in the length of the axle seat or wheel bore the fit will be unsatisfactory. As the result of more accurate machining the chart for each wheel mounted now consistently shows straight lines terminating at approximately the proper pressure ordinate.

Above the curve for each operation the car and wheel numbers, date and name of the operator are recorded, and the chart is filed. Should trouble occur with any particular wheel, it is then possible easily to ascertain all the data concerning its mounting.

Tension Test for Brake Rods

WHEN the threads on the end of a brake rod have become worn or damaged it is the practice in the Harvard shops of the Cleveland Railway to cut off the threaded end of the rod and weld on a new piece of stock. After the repaired rod has been rethreaded, the strength of the weld is tested with the machine shown in the accompanying picture. The threaded end on which a nut has been screwed is held in a jaw while the clevis on the other end is pinned to a bar attached to the frame of the testing machine. Tension is applied to the rod by admitting air to a 10-in. cylinder, the force exerted by the piston of which being transmitted to the rod through a system of levers.

To accommodate the maximum testing stress to the size of the rod, three adjustments of lever ratios are provided. Since it is also possible to vary the tension by the amount of air admitted to the cylinder, a framed chart has been placed convenient to the operator, showing the pull exerted for each of the three lever ratios with values of the air cylinder pressure varying from 10 to 100 lb. per square inch. The maximum force that can be exerted by this machine is 68,500 lb., which occurs when the highest lever ratio is used and the full shop air line pressure of 100 lb. per square inch is admitted to the cylinder. The admission of air to the cylinder is controlled by an ordinary car brake valve, as seen in the illustration. The gage at the left shows the air cylinder pressure while the one at the right is connected to the air main.



GIVING WELDED BRAKE RODS A TENSION TEST BEFORE RETURNING THEM TO SERVICE, CLEVELAND RAILWAY

Transfers Issued Only When Fare Is Paid in Fort Wayne

SINCE the weekly pass system has been in effect on the Fort Wayne city lines, it has been found necessary to issue transfers only at the time fare is paid. For the past several years patrons have had the privilege of obtaining transfers at almost any time. However, with the advent of the weekly pass, this system had to be done away with for the reason that the operator is not able to tell after a patron had passed him whether fare had been deposited in the fare box or pass used.

On account of the order issued to operators not to issue transfer after patron had passed the fare box, a great many complaints were received. To overcome this trouble, notice was placed at the mouth of the fare box reading, "Transfer Issued Only at Time Fare Is Paid." In addition to this the company ran full-page advertising in the local newspapers, also pasting these advertisements in the cars. Very satisfactory results have been obtained by using this plan, as it not only speeds up the service on account of delays occasioned by arguments, but has given the public the full information that this rule is inflexible and if they fail to ask for a transfer at the proper time, they have very little reason to blame the company.

How Resistance Is Used in Railway Automatic Substations*

An Engineering Analysis of the Numerous Conditions Which Affect Selection of Details of Equipment for Automatic Control of Substations —The Statements Are Based Upon Extended Experience in This Field

By C. A. Butcher
General Engineering Department,
Westinghouse Electric & Manufacturing Company

IN THE *Electric Railway Journal* of June 24 there were published several statements from electrical engineers on the subject stated in the title of this article. There is apparently considerable difference of opinion as to how the resistors should be employed, but a study of these statements, together with personal knowledge of many of the systems with which these men are connected, leads me to believe that there are no real differences among them other than the differences in point of view.

Current-limiting resistors have been used with both synchronous converters and motor-generators, but they are essential with converters. An over-current regulator operating in connection with an electrically-operated field rheostat to reduce the voltage of a direct-current generator is often superior to series resistors as a means of limiting the generator load and is the most frequently used. Since the inherent characteristics of a synchronous converter do not permit of field regulation for load-limiting purposes, series resistors are necessary. Several schemes, however, require considerably less resistance than others and, in addition, have other desirable features in some applications. These are discussed in the following paragraphs.

RESISTORS FOR USE WITH COMPOUND-WOUND CONVERTERS

When compound-wound converters are used, resistors of ohmic value sufficient to limit the current to 50 per cent overload are used. The arrangement is such that these resistors are normally shunted by three contactors which open consecutively, as determined by the action of overload relays. In other words, the bus voltage is given a drooping characteristic on excessive overload. The regulation is in three steps, the bus voltage being reduced by an amount equal to the drop across the resistors in circuit.

In small stations, as in interurban service, where more than one feeder leaves the station, it has been customary to have two steps of resistors between the machine and the bus, and one in each feeder circuit. In large metropolitan stations, three steps have been generally used because of the larger number of feeders which are usually supplied.

The resistance values of each of the first two steps to be cut into circuit when the load is supplied partially from another source are determined, in the final analysis, by the fixed resistance of the circuit between the two sources of supply, each step being seldom more than half this value and often much less. These two steps provide regulation on overload by dropping the effective station voltage sufficiently to cause other stations to take more of the load. The third step of resistance is for current-limiting purposes and is usually cut into circuit only on short circuit. Following a total system outage, in locations where automatic stations are but a small portion of the total capacity supplying a given load, the automatic stations will be the first to resume service, and until other equipment is restored to service, the load may be of short circuit proportions in which case the automatic stations would operate with all resistance in circuit.

The thermal capacity of the third step, then, should be sufficient to allow for the normal time required to restore service. The thermal capacity of the first two steps is usually such as to give a longer time, dependent on the character of the load supplied. In interurban service, where only infrequent load swings are had, little thermal capacity is required. It is customary to allow five to ten minutes at 50 per cent overload for resistors to reach a temperature which will cause the operation of the protective thermostat. In metropolitan stations, it may be necessary to operate for the greater portion of an hour with one or two steps of resistance in circuit. It is, therefore, desirable to insure practically continuous capacity for these resistors.

LESS RESISTANCE NEEDED WITH SHUNT-WOUND CONVERTERS

If shunt-wound converters are used, only one step of current-limiting resistance, together with its shunting contactor, is used for each unit to provide against very severe overloads. Normally the inherent voltage droop of the machine is sufficient to prevent overloading beyond the short-time overload capacity of the unit. The drooping characteristic of the shunt machine may be compared with that of the compound-wound machine and a series limiting resistance shunted by contactors in an infinite number of steps, so controlled as to increase the value of effective resistance, to prevent increase in load above a predetermined maximum.

Experience has shown that under some load conditions in metropolitan service, the insertion of limiting resistance produces sufficient drop in bus voltage to cause the dropping of an excess amount of load, with the result that the load controlling relays operate immediately to reclose the resistance shunting contactors. The operation is rapidly repeated, thereby producing "pumping."

From the very low resistance between stations in a metropolitan system, it is obvious that a drop of a very few volts at the bus in one station may cause the transfer of enough load to other stations to overload them in turn. Thus there may be set up a condition of "pumping" of the load back and forth beween stations. Such condition is impossible with shunt-wound machines, each of which at all times, due to the drooping characteristic, tends to shed the load.

ECONOMICS OF TROLLEY VOLTAGE

It may be argued that low voltage is not desirable at increase in load. However, in congested areas where traffic conditions govern schedule speeds, high, or even what is usually considered normal trolley voltage cannot be economically utilized. Voltage higher than that required to maintain the schedule speed gives rise to increased rheostatic losses on the car in proportion to the excess voltage. During the peak load, when traffic is most congested, this gives rise to increased demand to the extent of the increased losses. Therefore not only are losses increased but, where power is purchased on the basis of demand, the demand charge is also excessive to the extent of the increased losses. Therefore the lowering of the voltage with an increase in the load at stations in areas of congested traffic is a decided economic advantage.

---

*See also articles in the issues of this paper for June 24, 1922, page 997, and Aug. 5, 1922, page 199.

This truth has been very definitely established in cities where the bus voltage at such stations has been reduced during peak loads. During light-load periods, when the load on the machines in operation is light, schedule speeds are not, to the same extent, limited by conditions of traffic and are more nearly a function of the trolley voltage. Therefore, the higher voltages at the lighter loads may be desirable. To operate economically, however, the converters in service should be loaded as nearly as possible to the point of maximum efficiency, which is usually about full load. Such operation will quite definitely maintain the bus voltage at an approximately constant value.

LOW TRANSFORMER REACTANCE USED WITH SHUNT-WOUND CONVERTERS

It is customary to operate converters with a field strength such as will give unity power factor at average load. With this arrangement, a compound-wound converter will operate at lagging power factor below this load and at leading power factor above it. A shunt converter operates in a reverse manner, with leading power factor at the lighter and lagging at the heavier loads. Therefore, there would be the same approximate resultant heating of the armature tap coils in either type. If transformers of 15 per cent reactance were used with a shunt machine, the variation of voltage would probably be excessive; therefore, transformers of approximately 7 per cent are used to give about 5 per cent regulation of the direct-current voltage.

VOLTAGE MIGHT BE GRADUATED BY ZONES

Since trolley voltage above what is actually required to maintain schedules gives rise to increased losses and excessive power demand it would seem advisable to operate stations supplying congested areas at lower voltage. Within certain limits it may be practicable to do this. For example, stations in an inner ring might be operated at 500 volts, those in an intermediate ring at 550 volts and those in an outer ring at 600 volts. Such a scheme could be worked out only where all stations are small and supply power to areas in which all cars move at about the same schedule speed.

Where large multiple-unit substations are feeding relatively large areas in which cars are moving at different schedule speeds, as obtains on the different parts of a line which passes from a congested area into an area where free open running is possible, such a scheme is not practicable unless the station is being operated with a sectionalized direct-current bus with each section at a different voltage. This arrangement requires careful sectionalizing of the trolley system, and increases the number of feeders and the total copper required. It also has the disadvantage that greater converter capacity may be required because advantage is not taken of the diversity factor of the total station load.

It may be more practical and economical to permit of feeder drop to the congested areas such as will give more nearly the economic average trolley voltage. This simply means that the losses would be partly transferred from rheostatic losses on the cars to losses in the feeders. Offsetting the increased feeder losses would be lower fixed charges because of the reduced investment in copper.

SEVERAL TYPES OF FEEDER CONTROL ARE IN USE

Of the various types of feeder control equipment in use, each type has its adherents. However, each one has its own particular field of application.

The current-limiting resistance type of feeder, was applied until very recently almost exclusively to automatic substations regardless of capacity or the class of load supplied. For stations supplying power for interurban service, the application is quite satisfactory when the number of cars or trains on a given feeder are seldom more than two, but in a great many cases it is unnecessary.

Where converters are subjected to infrequent but heavy swinging loads, such as may be due to the acceleration of heavy trains, the resistors in series with the feeder, together with resistors in the machine circuit, by limiting the current to be commutated, will enable small converters to handle service which otherwise would require larger machines. The only argument for a resistor in the feeder is that it will, under some conditions, be sufficient to hold the load below the value at which resistors would be cut in between the machine and the feeder bus and thereby prevent penalizing other feeders supplied from the same bus with the consequently lower voltage.

When the resistance per mile of track is relatively high, the feeder-limiting resistor added to the circuit resistance of a grounded trolley may be sufficient to hold the current below the point at which machine-circuit resistors would be cut into circuit. In this case, a line car could move to within a short distance of the break and less time would be required to make repairs. At the same time normal service would be operated on other feeders.

On the other hand, if the fault occurs near the station the total resistance in circuit, including the current-limiting feeder resistor, will not suffice to limit the machine current to a safe value and part or all of the resistance between the machine and the bus will be cut into circuit. Should the short circuit not be burned clear, the resistors will overheat, with the result that the station will be shut down by the functioning of the resistor thermostat. Then when the grids cool the station will again automatically start, only quickly to shut down again if the short circuit condition persists.

Dependent then upon the thermal capacity of the resistors, the stations will start up and shut down periodically until the short circuit is cleared, penalizing all feeders supplied from the station. Not only are they deprived of a source of power, but if supplied from other stations they will be loaded excessively by feeding back into the "short" through the feeder bus.

To a great extent, this condition may be prevented by making the feeder resistor of considerably less thermal capacity than the machine resistors so that it will reach a temperature that will cause the feeder isolating switch to open before the station is shut down. The station then, relieved of the short-circuit load, will resume normal operation on other feeders. However, if the aggregate load on other feeders is heavy, the total load on the machine resistors with a short circuit on the one may be sufficient to overheat the machine resistors and thus shut the station down as described.

HOW MANY RESISTORS WILL IT PAY TO INSTALL?

With but few feeders, as are usually found in interurban substations, it is not difficult to arrange the resistance values and the thermal capacity of feeder resistors so that satisfactory operation will result. The question becomes one of economics: How much capital shall be invested in a lot of highly inactive cast iron, together with the switching required for it? If for example a 500-kw. machine can, by the use of resistance, be made to handle the work of a much larger machine, considerable investment is no doubt justified. If not, it is of doubtful value.

FUNCTION OF THE AUTOMATICALLY RECLOSING BREAKER

In small stations, supplying light interurban passenger service, an automatic, service-restoring contactor is inexpensive and is highly satisfactory. With such equipment, no current-limiting resistors are used. The contactor opens on overload and recloses automatically by the functioning of a relay in a Wheatstone bridge circuit set up to function when the resistance of the external circuit has increased to a value above a predetermined minimum. To permit the trolley to be sectionalized at the substation, similar equipment is supplied for each feeder circuit.

In case of a grounded trolley break, a line car may not be able to proceed towards it past the substation, as may be done under some circumstances with the resistance type of feeder. This is also true, however, where manually operated substations equipped with standard devices supply power to the system.

A feeder breaker in a small interurban station, out on a "short," is usually out to stay until the "short" has been cleared mechanically. The delay time on the train sheet chargeable to trolley breaks will not be increased by the use of the service-restoring contactor, and should show a decrease because of the fact that service is restored immediately after the circuit is cleared.

Where all manual equipment is used, the station operator must be notified to close the breaker. The time required for this depends on the available telephone facilities. In view of the fact that the man clearing the "short" has walked some distance to reach it, several minutes may elapse before he can hook up a portable telephone, get in touch with the operator and have a breaker closed. Even with the resistance type of feeder equipment, several minutes may be required for the resistors to cool before the contacts of the thermostat will operate to restore service.

CAPACIOUS MACHINE RESISTORS SOMETIMES NECESSARY

In large metropolitan stations, from which radiate relatively large numbers of feeders, the aggregate load in actual service will often reach values such as to bring current-limiting resistors into the machine circuit when the load on any one feeder is not sufficiently heavy to cut in a feeder resistor. Should a given station be overloaded due to an outage on one or more adjacent stations, it may be shut down by overheated machine resistors without a single feeder resistor having been cut into circuit. Such a condition can be prevented only by installing machine resistors with thermal capacity sufficient for continuous operation. The number of resistors required to do this is indeed a large item of expense.

Considering a metropolitan 600-volt railway distribution system, the effective total resistance between substations is very much smaller than the resistance between stations on an interurban system. The load is also more uniformly distributed between metropolitan stations than between interurban stations. Because of the low resistance between stations (0.03 to 0.06 ohm), a drop of a few volts at one station will result in the dropping of a large part of the load. Therefore, feeder resistors for metropolitan service must be of low ohmic value and are consequently of little value in limiting current in the event of short circuit. The application is therefore not practicable. Experience has shown that some other method of feeder control is required for this class of service.

CONTINUITY OF SERVICE IS FREQUENTLY ESSENTIAL

Under other than short-circuit conditions and often regardless of a short circuit it is highly desirable to stick to the load. In most cases, it is desirable to open the feeder only when a "short" occurs. If the feeder is carrying a legitimate load, even though abnormally heavy, such as one due to a congestion of cars, it is desirable to maintain voltage as nearly normal as possible to assist in clearing the congestion with minimum delay.

It is not desirable to delay the movement, as is done when voltage is reduced. Such, however, is done when current-limiting resistors are inserted in the circuit. Congestion on one feeder is usually the result of blockade involving several different lines so that simultaneously with the overloading of one feeder, other feeders from the station are at less than normal load. The station then is probably pulling the same total or even less than normal load. For the short time only that usually is required, the feeder circuit will safely carry the current necessary to clear the traffic.

A type of feeder equipment now very popular and applied quite generally in metropolitan service, differentiates between true overload and short circuit. A legitimate overload, regardless of value, will not open the circuit unless the cable reaches an excessive temperature. A thermal relay then operates to open the feeder and lock it out of service. It must be understood that the current limiting features in the machine circuits are retained even when this type of feeder is used. The rapid rise in current of a short circuit produces a voltage "kick" in a small series transformer which operates an instantaneous relay, and thereby causes the opening of the feeder circuit contactor or breaker. Normal changes of load do not cause a sufficiently rapid rate of change in current to produce voltage sufficient to operate the tripping relay. The reclosing of the feeder contactor is dependent on the action of a relay in a Wheatstone bridge circuit set up to measure the resistance of the external circuit. When the short has cleared or the resistance has increased sufficiently to limit the load to a predetermined value, the feeder circuit is automatically re-established. In the case of tie feeder circuits, i.e., feeders with more than one source of supply, the feeder contactor in each station will reclose immediately upon the energizing of the feeder from any point, provided, of course, that the short circuit has cleared. This type of feeder equipment will close from voltage applied either to the feeder or the feeder bus. The feeder bus in any station therefore continues to act as an equalizer regardless of whether or not the machines in the station are out of service or fail to resume service following a total interruption of service or any disturbance which might so reduce the bus voltage in an idle station to a value which would cause all feeder switches to drop open. The feeder bus once energized by the closing of a feeder circuit, permits the closing of all stub-end feeders.

A feeder circuit designed for an average voltage drop of 10 per cent will have a maximum drop of 20, so that the least probable value of short circuit would be five times normal. It is therefore evident that the picking up of legitimate loads of normal or even excessive value will not produce a voltage "kick" in the tripping relay sufficient to cause the feeder circuit to be reopened. Since the operation is against short circuit and not overload, it is obvious that the breaker will rarely open. The reclosing system is rugged and sensitive; permitting adjustment for reclosing at very low values of resistance. Numerous applications of feeder equipment of this type covering a period of a year have been highly satisfactory.

Substations equipped with this type of feeder which immediately isolates shorted feeder circuits do not require as many steps of current limiting resistors between the machine and the bus. There is little probability of a traffic congestion within the feeding radius of a given station such as to give rise to a load of short circuit proportions, and it is therefore unnecessary to provide resistance to limit the current, as on short circuit, to the two-hour machine rating. With compound converters, two steps, each producing a drop sufficient to transfer a given portion of load to adjacent stations, are entirely adequate. For satisfactory operation, these steps should have thermal capacity calculated to give practically continuous operation under 50 per cent overload. The standard temperature relays, which follow very closely the time temperature characteristic of the machine, prevent damage to the machines from overheating by taking them out of service until they have cooled to a safe operating temperature. With shunt converters only a single step of resistance is required.

A modification of the short circuit selective feeder equipment eliminates the Wheatstone bridge reclosing feature and provides means for burning the "short" clear. This feature is described in the following paragraphs. Many operators feel that trouble crews can so quickly reach and clear a trolley break that the expense of burning off the short is not justified.

SUPERVISORY REMOTE CONTROL NEEDED

Experience in the operation of automatic substations in metropolitan service has shown the necessity of some form of supervisory control. One system worked out and in process of installation provides facilities at a central dispatch point for the supervisory control of all machines and both a.c. and d.c. feeders at each substation. This control is superimposed on full automatic equipment so that independently of the supervisory system, all functions are automatic. The devices are those used in the highly developed schemes of machine telephone switching. A modification of the automatic service "restoring short" circuit selective feeder equipment is used in these stations.

To illustrate the operation, assume that a d.c. feeder opens due to short circuit. The operation is indicated to the load dispatcher by the lighting of a small lamp on a control board very similar to that used in a central telephone exchange. In this particular application, the lighting of the lamp indicates that the particular feeder has been transferred to an auxiliary bus. By a selective switching arrangement, the load dispatcher may transfer other feeders which are supplied from other stations to the auxiliary bus. The flow of current to the shorted feeder thus limited by the resistance of the tie feeders will usually burn off the "short" with minimum disturbance to operation. As soon as the "short" has cleared, the feeder is automatically reconnected to the main bus. As before, the operation is indicated to the dispatcher who then proceeds again by means of selective switching to restore the other feeders to the main bus.

In a similar manner, any machine may be started or stopped and any high-tension circuit breaker opened or closed. Inspection of the indicating panel in the load dispatcher's desk gives a visible indication of the operating status of each machine and feeder circuit. In addition to such indications, the load dispatcher has before him a continuous indicating and graphic record of the total load in amperes at each station. This is by a system of remote meter indication. But two pairs of ordinary telephone leads are used between each station and the central dispatch point.

Obviously, a simplification of this scheme is all that need be applied to the average system. Several very simple schemes of a similar nature are in process of manufacture for application to the control of automatic hydro-electric generating stations. Over a single pair of telephone leads, a dispatcher receives audible signal of any unusual operation. By dialing a given number on an ordinary subscriber's automatic telephone set, a selector is set into operation at the substation. This selector, by audible code signals, picks out, for example, the feeder which has opened or similarly indicates any other abnormal operation. By proper dialing, the load dispatcher has complete supervision of the automatic station. Such a system permits of the proper operation of the substation equipment to meet almost any operating emergency.

Automatic switching must be applied to meet service requirements. Since these requirements are not standard, no standard control can be adopted and the details can be determined only after a study is made of the requirements of each application.

New Line of Multi-Speed A.C. Motors

THE Mechanical Appliance Company of Milwaukee, Wis., is marketing a new line of multi-speed a.c. motors which provide for speeds of 600, 720, 900, and 1,200 r.p.m. These motors are of the squirrel-cage type, and are rated on a 40-deg. basis—that is, they will carry full load indefinitely without exceeding 40 deg. They will carry 25 per cent overload for two hours, with a temperature rise not exceeding 55 deg. C. These motors are particularly applicable to machine tool drives in shops provided with alternating current.

Super-Power Plant for Paris Region

IN ORDER to secure maximum fuel economy the power producing interests of Paris, France, have combined to supplant the present power generating facilities with those of the latest and best types. The great power plant discussed briefly in an article in the issue of the *Electric Railway Journal* for May 8, 1920, page 952, is now approaching completion. For the present it will contain five 40,000-kw. turbo-generator units, but will ultimately be extended to a total capacity of 320,000 kw. This plant is being built and will be operated by the Union d'Electricité, which is the successor of the Union Française d'Electricité, formed in 1919.

The steam pressure which will be used in the plant is 313 lb. gage, at the turbine throttle, where the superheat will be about 280 deg. F. One of the elements in securing economy in the plant has been the use of large boilers, so that five double-end and ten single-end boilers supply steam for 200,000 kw. The double-end boilers are of the Stirling type and they are equipped with Riley underfeed stokers. The grate surface of each double boiler is 660 sq.ft. The single-end boilers are of the B. & W. type. These are equipped with chain-grate stokers, and their grate area is 394 sq.ft. per boiler.

The superheater surface in the double-end boilers is slightly under one-half the heating surface, which is 22,600 sq.ft.; while in the single-end boilers it is much more than one-half, the heating surface in this case being 14,300 sq.ft. Economizers with heating surface slightly greater than the superheater surface are provided, and air preheaters are used to extract part of the heat from the flue gases for the purpose of warming the air entering the furnaces.

The boilers are guaranteed to deliver 5.85 lb. and 6.15 lb. of steam per hour per square foot of heating surface for the double-end and single-end types respectively.

The turbo-generator units are rated at 40,000 kw. on the basis of maximum continuous load. They operate at 1,500 r.p.m. and produce 50-cycle three-phase current at a terminal voltage of 6,000.

On account of the high pressure and temperature of the steam the water rate of the turbine is low, the guaranteed steam consumption at each of several loads being as follows: 40,000 kw., 9.62 lb. per kilowatt-hour; 30,000 kw., 9.46 lb.; 20,000 kw., 9.9 lb., and 10,000 kw., 11.0 lb.

The generators will be cooled by means of a closed air system, with coolers located in the foundation.

The turbines are of the Zoelly impulse type, single cylinder and single flow. They contain but ten pressure stages in the expansion, an unusual feature in turbines of this size, at least from the standpoint of the American designers. High pressure steam is admitted into the second stage above 30,000 kw., the admission valves being operated automatically. Provision is also made for bleeding steam from the seventh and eighth stages for feed-water heating, a factor in maintaining the heat balance of the plant.

In addition to the use of large units and high-pressure, high-temperature steam, every effort is made in this plant to recover the lost heat.

Mention has already been made of the economizers and preheaters. The economizers form one part of the equipment for heating feed water. In addition the condensate is used in part for cooling the generator ventilating air, thus absorbing waste heat. The exhaust from the steam-driven boiler feed pumps also yields heat to the condensate, which is also used for cooling the generator bearings. In addition the feed water is heated still further by means of steam bled from the turbine, as already mentioned.

The Gennevilliers plant is well located as to fuel supply, being on the bank of the Seine and contiguous to the Paris-Havre Railway. Coal received on barges or railroad cars can be stored in a 60,000-ton yard lying along the river, or it can be delivered directly to a coal-handling equipment which will crush and elevate it, distributing it to the overhead bunkers. The bunker distribution is by means of a monorail system, with an elaborate sectionalizing and block-signal arrangement, by means of which 6-ton traveling hoppers can be dispatched with great facility. These hoppers are driven by two electric motors each, and current is taken from a trolley wire at 500 volts.

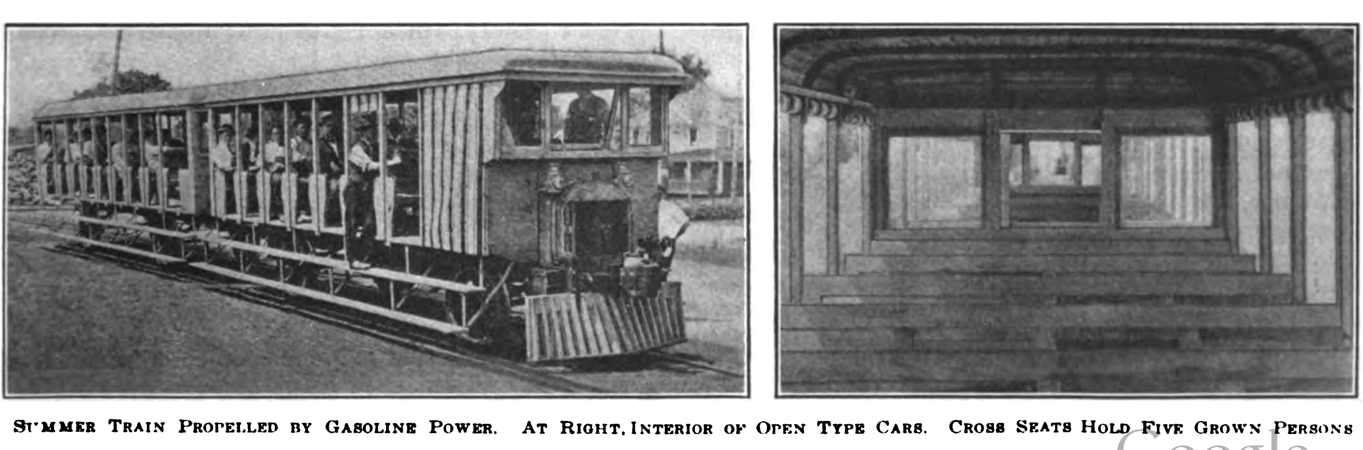
Eighty-five Passengers on Gasoline Train

A GASOLINE "summer train" of the two-car type, manufactured by the Four Wheel Drive Auto Company, Clintonville, Wis., has just been completed. The cars are of the open type with adjustable curtains along the sides to provide protection for passengers against sun or rain.

The forward car of this unit has a seating capacity of thirty-five persons, and the rear car can accommodate fifty. Each seat provides room for five grown persons.

The cars are equipped with air brakes, electric starting device and horn, standard M. C. B. couplers, locomotive type "cow catcher" on the forward car, sanders for sanding the rails, and high-speed reverse gear which enables the cars to go as fast in reverse as forward.

During the test runs this equipment has attained a speed of between 35 and 40 m.p.h. The cars have rounded curves up to 16 deg. curvature at a speed of 25 m.p.h. without the least trouble, and can round much sharper curves at a reduced speed.



SUMMER TRAIN PROPELLED BY GASOLINE POWER. AT RIGHT, INTERIOR OF OPEN TYPE CARS. CROSS SEATS HOLD FIVE GROWN PERSONS

The Boston Elevated Railway—Four Years Under Public Control

This Review Takes Up by Years the Financial and Operating Results of the Trustee Plan—Much Has Been Done to Improve the Service and Rehabilitate the Property, Which for the First Time in 11½ Years Has No Notes in the Banks

By Edward Dana
General Manager Boston Elevated Railway

IN THE February, 1921, issue of the *National Municipal Review* there appeared a paper read by Mr. Jackson, chairman of the Board of Trustees of the Boston Elevated Railway, at Indianapolis on Nov. 17 and 19, 1920, outlining the public trustee plan in Boston (created by Chap. 159 of the Special Acts of the Legislature of Massachusetts of 1918 known as "The Public Control Act."* On June 30, 1922, four years of public control had elapsed.

In attempting to outline the situation at the close of these four years, it seems appropriate to make reference to facts and conditions and permit individual conclusions to be drawn from them.

The paper of Mr. Jackson outlined the functioning of the act, and it is assumed that the method devised in Boston under the Massachusetts plan is consequently understood. In order therefore to visualize the operation of this public utility, it seems wise to call attention to the statistics showing revenues and expenditures by years since 1910 and from them to point out salient features and then explain what is actually going on at the present time.

In the first instance from 1910 to June 30, 1918, the fare had remained at 5 cents and the gross revenue during these nine years had increased from $15,250,000 to $19,500,000. Operating expenses had increased from $10,000,000 to $14,250,000, the chief factors being the gradual increase of the payroll and the increased cost of fuel. During these years the allowance for renewals or depreciation had been insufficient and also during this period in order to hold the 5-cent fare in face of increased operating expenses and other fixed charges, adequate current maintenance had not been provided. Under these circumstances, with less maintenance than was required by the property, with insufficient renewals and with the passing of the dividends completely for the year, the year ending June 30, 1918 showed an operating deficit of $598,442.

It was these facts which resulted in the experiment with public control beginning July 1, 1918, under the service-at-cost plan, which is based on sound economic principles. It was designed to put an end to the downhill flight which had been going on unceasingly, as new subways had been added which increased the charges on the car rider and as operating expenses steadily increased, notwithstanding insufficient provision for maintenance and renewals.

COMPARATIVE DIVISION OF RECEIPTS AND EXPENDITURES FOR THE YEARS ENDING JUNE 30, BOSTON ELEVATED RAILWAY

Note: Figures given are to the nearest dollar.

	1922	1921	1920	1919	1918	1917	1916	1915	1914	1913

				$5,415,500						

The first year of public operation under the provisions of the act required an increase in fares. At the same time substantial increases in wages and cost of materials, supplies and fuel were occasioned by war conditions, with the result shown in the tabulation of an actual deficit of $5,415,500.

During the first year it was necessary under the act to use the reserve fund of $1,000,000 created under the act and to assess the cities and towns in the district served $3,980,151, in order to provide sufficient funds to meet the cost of service during that year.

During the second trustee year it was necessary to go to a flat 10-cent fare on the entire system in order to keep pace with the rise of wages and costs during these troubled times. At the end of the second year receipts exceeded cost of service by $17,079 which was transformed to a deficit by a retroactive wage award in July, 1920.

During the third year which ended June 30, 1921, operating expenses reached the maximum of $24,684,558, including for wages the maximum of $16,753,657. Subway rentals likewise had increased from $559,000 in 1910 to approximately $2,000,000 in 1921. Wages

---

*An abstract of Mr. Jackson's paper was published in the *Electric Railway Journal* for Dec. 4, 1920, page 1141.

had been further increased by arbitration in July, 1920. Yet the efforts made by the entire operating organization resulted in meeting the situation without departing from the 10-cent fare and holding the operating expenses to an increase of approximately $350,000 over the second year in the face of an estimated increase in wages, cost of materials and supplies of more than $3,000,000. The receipts during the third year exceeded the cost of service by $550,253.52 and permitted restoration of $131,985.01 to the reserve fund after payment of the second year's deficit.

The fourth trustee year has just closed and a different state of conditions is apparent. After meeting all costs of service, there remained a balance of $1,385,211.44. This balance, plus the $131,985 of the third year, has been applied in restoring the reserve fund to its original total of $1,000,000 and in making the first payment of $517,196.45 to the State for distribution to the cities and towns that contributed to the loan assessment in 1919. Operating expenses had been reduced from $24,684,000 to $22,113,000, and the payroll had been reduced from $16,753,000 to $14,920,000. This result was brought about not by radical cuts in wage rates but rather by the introduction of more efficient methods of operation and the co-operative efforts of the entire organization, together with reasonable reduction in rates.

COMPARATIVE DIVISION OF RECEIPTS AND EXPENDITURES FOR THE YEARS ENDING JUNE 30, BOSTON ELEVATED RAILWAY

Note: Figures given are to the nearest dollar

	1912	1911	1910
Total receipts	$16,522,542	$15,980,708	$15,245,865
Operating expenses			
Wages	$6,132,256	$6,098,711	$5,910,768
Material, supplies and other items	3,242,424	2,488,667	2,376,034
Injuries and damages	797,436	694,559	776,588
Depreciation	....	....	200,000
Fuel	804,519	837,128	822,498
Total operating expenses	$10,976,634	$10,119,064	$10,085,877
Taxes	$1,221,756	$1,244,833	$1,213,089
Rent of leased roads	2,178,523	2,143,263	2,028,165
Subway and tunnel rents	603,226	567,087	559,469
Interest on B. E. bonds and notes	837,033	556,000	556,000
Miscellaneous items	....	....	....
Dividends	1,197,000	1,197,000	1,002,003
Total cost of service	$17,014,174	$15,827,247	$15,444,604
Loss or gain	*$491 632*	$153,461	*$198.734*

It should be noted that the gross revenue fell from $34,224,000 in the third year to $32,781,000 in the year just closed. The Board of Public Trustees had inaugurated a system of local 5-cent fares in conjunction with the flat 10-cent fare which at the present time results in 21 per cent of the total traffic being handled for 5 cents and which has restored millions of riders on short hauls who were lost on account of the introduction of the 10-cent fare. The average fare consequently at the present time is 8.95 cents.

The retention of the basic 10-cent fare has been necessary, however, in order to secure the gross revenue required to meet the cost of service which in 1922 amounted to $31,396,281. As contrasted with this the gross revenue during the year 1917, when 381,000,000 revenue passengers were carried at a universal 5-cent fare, amounted to only $19,788,953. It can readily be seen that any hope of meeting the cost of service with a universal 5-cent fare cannot be realized.

At the present time, with the joint 5-cent and 10-cent fare, passengers are being carried at the rate of 360,000,000 per year, which is considerably above the low point of 325,000,000 in 1919 and not far from the high point of the 381,000,000 previously referred to.

It may well be asked at this time as to what effect the Boston service-at-cost plan has on efficiency of operation, incentive for economical operation, freedom from political or other interference and spirit of service to the car rider.

In this respect it is believed much has been accomplished. Employees have been acquainted with the provisions of the act, with the intimate details of financial matters and the progress made from time to time in improving service and meeting the difficulties of operation. During this period, two decreases in compensation have been amicably adjusted between management and employees and a constant effort has been made to operate the property always in the interest of the car rider with the fewest men possible. The average number of men on the payrolls during the four trustee years has been as follows:

NUMBER OF MEN ON PAYROLL

1918-1919	9,748
1919-1920	10,021
1920-1921	9,264
1921-1922	8,915

Likewise it is of interest to note that the labor turnover has been reduced to a minimum, and in fact all platform men or car service employees have been in service four and one-half years or more, which necessarily results in benefit to the service. This compares with a former annual labor turnover of 55 per cent.

In this connection it has been possible to work out an eight-hour day as well as a guaranteed pay of eight hours for all platform men, with the result that whereas under the former conditions a large number of spare men were required, under the conditions existing today a much smaller number of spare men are required all of whom receive a full day's pay. The so-called spare men reporting each day represent 6.7 per cent of the total today as compared with 20 per cent previously.

Referring to the statistical table again it is interesting to note that the expense incurred on account of injuries and damages for the fourth trustee year was $476,844. Following back through thirteen years it will be noted this is the lowest of any of these years, yet vehicular congestion is greater and the movement of people on the highways greater than in previous years.

The total expense on account of injuries and damages including the cost of operating the Claim Department, trial of cases, etc., for the last trustee year amounted to $620,207.73 which represents 1.89 per cent of the gross revenue, the lowest ratio in the railway's history.

Much has been done in improving the service. Although the mileage operated last year (49,662,045) was less than any year back to 1905, the introduction of two and three-car train service and cars of larger carrying capacity with scientific rearrangement of schedules has provided additional service where needed and permitted the elimination of mileage where not required.

It is of interest to note that the number of revenue seat-miles per revenue passenger for the last year was 7.5 which for those acquainted with this figure as an index of service would indicate adequate service allowance by mileage operated only where required. At congested points more seats are provided than before while surplus seating capacity has been removed at points where it previously existed. This is the acme of proper service and results in minimum cost to the car rider.

Under the act the Board of Trustees were charged with the responsibility of providing for proper maintenance. The percentage of total railway operating revenue applied to maintenance and depreciation consequently has been approximately 24 per cent, whereas previously the percentage of operating revenue applied to maintenance and depreciation had been 17 per cent. What has been accomplished with respect to car equipment is illustrated by a comparison of the number of disabled cars in 1918 and 1921 which shows a reduction of 68.7 per cent for surface cars and 53 per cent for rapid transit cars. The percentage of cars out of service in bad order has been reduced to 5 per cent. At the same time, through the operation of the renewal charge which has been conservatively adopted, it has been possible to replace much of the rolling stock which was unsatisfactory from the point of service to the car rider and expense to maintain. During the period of public operation 535 new cars have been placed in service and 140 additional cars are now on order.

A reasonable program of track reconstruction has been maintained and has resulted in improved operation, lessened the wear and tear on rolling stock, and reduced derailments.

The latest modern machinery has been employed in the construction of track in the interest of efficiency and economy. Recently it was found that the railway's own forces, due to organization and this machinery, were enabled to construct a section of track cheaper than the figures submitted for the work by contract on an advertised bid.

During the trustee year approximately 7 per cent of the track has been rebuilt as compared with an average of 2¼ per cent for the previous six years, which means 22 miles of track as compared with 8.

The following newspaper quotation is of interest:

> By dint of good planning for the night use of electric cranes, air compressors and a concrete breaker with five 500-lb. teeth, the Elevated gave an admirable lesson in quick tracklaying on Boylston Street over the week end.

Much could be detailed in regard to improvements such as have been made in power plant equipment, signals, repair shops, motorizing horse-drawn equipment, development of modern carhouse yards, as well as the progress made upon the modern centralized mechanical repair shops now under way all vitally affecting the quality and quantity of service which can be rendered.

The railway today has more than $2,000,000 cash on deposit, $1,000,000 of which is in the reserve fund created under the Public Control Act. For the first time in eleven and one-half years the railway has no money borrowed from the banks. As contrasted with this there was a floating indebtedness in excess of five millions during the first trustee year.

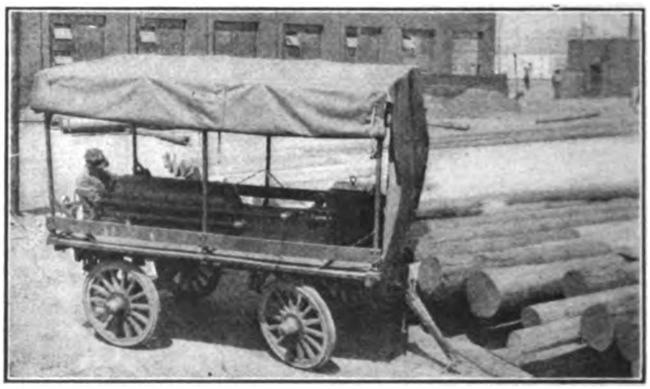
Engine-Driven Welding Equipment Developed

AN ENGINE-DRIVEN welding equipment for use where electric power for motor drive is not available and for job welders who must work in widely scattered districts has been developed by the Westinghouse Electric & Manufacturing Company. This apparatus is made in stationary and portable models.

The equipment consists of a Westinghouse single-operator welding generator geared to a Doman four-cycle, two-cylinder, low-speed, marine-type gasoline engine. The generator is direct current, has a rated capacity of 175 amp., and a maximum capacity of 225 amp., at 1,750 r.p.m. The generator is designed to operate at arc voltage, and to inherently stabilize the arc and supply a substantially constant current of different values over the working range of 90 to 225 amp. The operating characteristics of the generator are such that it is unusually easy for the operator to strike and maintain the arc, and also to obtain the deep penetration and thorough fusion necessary for satisfactory welding. The shaft of the generator extends through the pedestal bearing and is connected by means of a flexible coupling to the exciter.

Portable Paint Spraying Apparatus

THE Northern Ohio Traction & Light Company is experimenting with the spraying process for painting poles. For this purpose a portable outfit has been assembled using an old automobile trailer, on which was mounted a few pieces of car equipment such as may be found in almost any electric railway shop.



PORTABLE COMPRESSOR FOR SPRAY PAINTING POLES

These parts comprise a 550-volt compressor, a governor and an air reservoir bolted to the trailer platform as shown in the illustration. The sprayer is connected to the reservoir through the usual reducing valve with a 50-ft length of automobile type air hose. Power to operate the sprayer is tapped from an outlet on one of the yard poles.

The practice followed has been to spray first the upper halves of all the poles as they were laid out in single tiers in the storage yard and then pike them all over to paint the remaining surface. So far this method has given promising results. One man, of course, can accomplish more in this way than several by hand, partly because the roughness of the surface has less effect on the speed of working with a sprayer than with a brush. Being portable, this outfit may also be used for painting poles already in place.

POLES IN STORAGE CAN BE PAINTED WITH VERY LITTLE HANDLING

Letters to the Editors

Selecting Platform Men

BELFAST CITY TRAMWAYS
BELFAST, IRELAND, June 30, 1922.

To the Editors:

Articles on the selection and training of motormen, appearing in the various issues of the *Electric Railway Journal* from time to time, have greatly interested me. It is apparent that diverse views obtain on this subject, but all agree it is desirable to get the right type of men, that great discrimination has to be exercised in their selection and that, while operating conditions and types of men vary, the man selection problem is always with us.

One cannot always judge a man by his appearance; no man is infallible. Interviews register impressions, good, bad or indifferent. Later they help in determining whether one's judgment is at fault. Certain types of men are brilliant in an interview but not in car operation, and as the duties they have to perform are more of the specialist order, they cannot be sorted out into types, each type yielding the best results under particular treatment. That undertaking is fortunate indeed which has for its guiding hand one whose expert knowledge of human nature and sympathy with the problem fit him for the task.

On this system, a responsible department head interviews and engages all platform men, working upon a common sense system of his own, in sizing up men. By this means he comes into personal touch with every man, asks all questions and takes time to make the applicant feel that nothing has been left undone to give him a square deal. After the men have been trained, they are carefully followed up to see how they progress, also to show them that all interest in them is not lost as soon as they had passed into the service. It takes up time to interview men, but it is worth while in order to select the most suitable for the job. Having to discharge men as unsuitable is a very expensive matter, and it pays to take the time in selecting the right men.

All men in the service know that an easy channel of appeal is provided for them whenever decisions seem to be unfair.

That we have been successful in the care and selection of our platform men is shown by freedom from accident and damage suit claims. Whether this is due to the fact that the greater number of our men are country bred is an open question. My own personal experience is that country men who come into the city seeking employment are anxious to get into a settled occupation with steady wages, which are usually higher than they have been receiving, and once they get a start they will, as a rule, stick tenaciously. They are slower to pick up instructions, but, under tactful teaching and guidance will learn readily enough, are reasonable in their views as regards hours of labor and discipline, and whether in the shop or on the road are not afraid of work.

On the other hand, the town bred man is more used to selecting his own occupation and if he is not satisfied with the prevailing conditions, he soon shows it, does not worry about being discharged, and as often as not discharges himself and uses his friends to get work elsewhere. His knowledge of the city and places to apply for work enables him to please his own inclination. Consequently, his job for the time he is employed does not grip him in the same way.

Whatever type of platform man is selected, either from the country or town, the fact cannot be disguised that each year adds to his duties more exacting operating conditions, due to higher speeds, heavier cars, and denser traffic on the streets.

Bad driving does not necessarily proceed from incompetence on the part of the motorman. It is usually due to recklessness, over-confidence and lack of consideration for others. In fact, some men seem just as reckless as they dare be. This type of motorman cannot be discovered during his training period. He indulges in speed intoxication whenever the chance offers and only realizes that the road does not belong to him after he has had a bad smash.

While the points raised are the daily experience of all traction men, the only way we have of making contact is by absorbing the written results of each other's labors and perhaps there may be some one way trail leading us to the solution of our platform troubles and a formula written on how to select men to suit our various needs.

H. VERNON,
Rolling Stock Engineer.

Now San Francisco Adds Another Section To The Previous "57 Varieties"!

BROOKLYN RAPID TRANSIT SYSTEM
BROOKLYN, N. Y., Aug. 7, 1922.

To the Editors:

In the interest of standardization in general and of street railway rails in particular, some comments may not be out of place relative to the proposed 121-lb. 9-in. girder rail which is to be rolled for the Market Street Railway of San Francisco, mentioned in the issue of the *Journal* for July 29.

Our old friend, "Mr. Local Conditions" seems to have had his say to good effect in this instance and another rail section is to be added to the overburdened catalogs of rail sections, although there may be some small satisfaction in noting that the two fundamental principles of the A.E.R.E.A. standard 9-in. rail design are to be followed. These are the tapered web and the curved head. It is also noted that the joint plates are apparently of the type following the A.E.R.E.A. designs although the full advantage of the wide bearing area at the tops of the plates is not obtained with the new rail section, if your drawing is correct.

One feature of the article describing the new rail mentions the omission of the sloped back or bevel of the head and the relation of such a bevelled head to asphalt laid directly in contact with the rail heads. It may be of interest to state that the association standard 7-in. rail having this bevelled head has been in service in Brooklyn over five years in asphalt pavement laid directly in contact without developing any serious or special wear which can be ascribed to this feature of the standard rail design. Furthermore, perhaps 5 or 6 miles, measured as single track, are being laid in this manner in Brooklyn this year as the result of the experience with previous installations in modern track. Also, the rails here are carrying wheel treads 2½ in. wide with ⅝-in. deep flanges, and the wide head of the association standard is considered an advantage when wheel treads become widened as they frequently do, after a reasonable period of wear.

In closing, it may be noted that rail manufacturers informally advise the writer that about 75 per cent of their orders for both 7-in. and 9-in. girder grooved rails, this year, have called for the Association Standard sections. So we may take heart in our efforts to standardization even though, here and there "local conditions" still have their say.

R. C. CRAM,
Engineer Surface Roadway.

The A. E. R. E. A. Standard Spirals and the Proposed Clearance Curves

THIRD AVENUE RAILWAY SYSTEM
NEW YORK, N. Y., Aug. 2, 1922.

To the Editors:

In your issue of July 15 there appeared an article by S. Striezheff, department of way and structures Brooklyn Rapid Transit System, entitled "Switch Easements and Frog Standardization."

The author seems able to find but little good in standardization in general and in the standards of the A. E. R. E. A. in particular. He quotes with apparent approval "a prominent American engineer" to the general effect that it was common practice in France to install "curves of plain radius and that the cars going over them would after a while work out a spiral for themselves at each end of curve."

In discussing the standard A. E. R. E. A. spirals the author makes a comparison between one of them and Lorain spiral No. 3 with 150-ft. radius switch, which he considers decidedly preferable.

Of course, 150-ft. radius switches and spirals made by the cars themselves are in use, but it is difficult to see how any progress toward standardization can be obtained if such practices are adhered to. The A. E. R. E. A. standards so far adopted have been worked out after an expenditure of much time and study by committees of engineers representing some of the largest of the street railway systems in the United States with the expert assistance of the designing engineers of the special trackwork manufacturers. The standing committees of the A. E. R. E. A. are steadily at work endeavoring to determine on such further standards as may prove practicable. It is believed that a sympathetic study of the standards already adopted by the association will make clear to the industry generally the value of adopting them, from the points of view both of efficiency and economy.

E. M. T. RYDER,
Way Engineer.

Paving Breakers Used to Demolish Building

THE Ingersoll-Rand Company, New York, N. Y., has given out information regarding the use of its CC-25 paving breakers for removing the side walls and top of a large venturi vault in a filtration plant in Cleveland, Ohio. Paving breakers have been used by electric railways in connection with the breaking up and removal of pavement and no doubt some electric railways may have occasion to use them also in connection with demolishing building construction. In the instance described, the paving breakers not only broke up the concrete into pieces with the aid of a cutting chisel they also cut off steel reinforcing rods. Walls 12 in. in thickness, 51 ft. long and 10 ft. high were removed in seven days. The roof of the vault was removed in three and a half days.

Railroad Traffic in New York City

Four Electrified Passenger Terminals Show Increasing Traffic—Flatbush Avenue Terminal of the Long Island Railroad Handles Largest Traffic of Any in This Country

IN CONNECTION with the studies made of the local transportation problem, and bearing upon the need of future provision for handling of suburban passengers within the city, the New York Transit Commission has collected figures which show the steam railroad and local ferry traffic to and from New York in 1921. These figures, based either upon actual counts or very careful estimates, show that the trunk railroads entering New York or approaching upon the New Jersey side carried a both-way passenger traffic of 220,847,049 in 1921. Of this number 148,958,292 were commuting, zone, trip ticket or reduced fare passengers, while 71,808,757 were regular fare passengers.

In addition, as indicated by the figures furnished to the commission, local passengers upon the ferries entering New York, exclusive of interborough ferries, and also excluding railroad passengers delivered to destination in this manner, were 52,621,220, a grand total of traffic in and out of New York by railroads and ferries of 273,468,269 during 1921. As this local ferry traffic is almost entirely commuting in character, it may be combined with the figure of railroad commuter traffic, showing a grand total of commuters in and out of New York of 201,579,512 for the year.

The total increase in railroad traffic for the year was 978,333, which is regarded as a very low figure, doubtless occasioned by the business slump, as both railroad and rapid transit traffic have been frequently observed to be indices of business conditions. The bread-line season of 1913-1914 exhibited the only actual falling off in trolley, subway and elevated travel which has occurred in New York in decades.

The railroad total, while it includes the electric lines of the trunk roads together with the electrically operated Westchester & Boston, does not include the traffic borne upon the Hudson & Manhattan Railroad, which last year carried 94,559,352 passengers; 59,221,354 to and from Hudson Terminal and 35,337,996 to and from uptown New York, an increase of 8,873,484 over 1920.

Traffic to and from the St. George terminal of the steam lines on Staten Island is also not included, as this is almost purely intercity travel, with only a few commuters from Perth Amboy, N. J. This traffic showed a falling off to 11,181,786 in 1921 from the 1920 figure of 13,011,958, a drop of 1,830,172.

The following tabulation presents a comparison of traffic upon the trunk lines to and from New York in the years 1920 and 1921:

PASSENGERS IN AND OUT OF VARIOUS STEAM RAILROAD TERMINALS IN NEW YORK CITY IN 1920 AND 1921

	1920	1921
Baltimore & Ohio	330,000	551,880
Central of New Jersey	18,136,928	16,718,099
Delaware, Lackawanna & Western	21,553,040	21,594,743
Erie	31,248,990	30,026,406
Lehigh Valley	460,000	529,706
Long Island	59,133,876	60,386,698
New Haven	16,952,093	16,653,438
New York Central	28,717,270	28,434,974
Ontario & Western	634,132	619,658
Westchester & Boston	4,442,012	5,395,365
Pennsylvania	38,260,435	39,936,082
Totals	219,868,716	220,847,049

(The above columns include a few estimated figures.)

The Long Island Railroad continues to rank first among local steam lines in point of traffic handled to and from terminals, its total for the year being 60,386,-

698 passengers, of whom more than half, 32,893,995 rode in and out of the Flatbush Avenue terminal in Brooklyn. The remainder were carried to and from the Long Island terminals in Long Island City and Pennsylvania Station. In addition to the heavy traffic to and from its leading terminals, the Long Island picks up and delivers nearly 10,000,000 passengers at four other principal distributing points in New York, namely, Woodside and Hunters Point Avenue, adjacent to stations of the Interborough Rapid Transit Company, where about 4,000,000 and 1,000,000 passengers, respectively boarded and left trains in 1921, and at Jamaica and East New York, where, at each, more than 2,000,000 passengers were transferred to and from rapid transit lines of the B. R. T. system. As these figures are not included in the 60,386,698 total of terminal traffic, the passenger travel of the Long Island within New York City may roughly be estimated at 70,000,000.

The traffic into and from Flatbush Avenue is larger than that of any other single railroad into any other terminal in New York. This again excepts the Hudson Terminal, which is a station upon a rapid transit line. Thus, while it has a materially greater traffic than that shown by the Flatbush Avenue count, the net results are not comparable. So far as is known, the traffic figure at Flatbush Avenue marks it as the greatest trunk railroad terminal served by a single road in the United States, if not in all the world. All the terminal traffic is handled upon one incoming and one outgoing track, and as much of the loading occurs at the peak hours only, the feat of moving the trains according to schedule is described by railroad men as remarkable.

The Flatbush Avenue station is, however, exceeded in its passenger traffic by the Pennsylvania Station and the Grand Central Terminal, which last year had a traffic, respectively, of 36,866,815 and 36,157,012. The Grand Central Station is served by two divisions of the New York Central and the New Haven, while the Pennsylvania Station is served by four railroads, the Pennsylvania, the Long Island, the Baltimore & Ohio and the Lehigh Valley. All of these terminals of course are operated by electricity exclusively.

Publicity and Public Utility Credit*

By John B. Prescott
Prescott & Snider, Kansas City, and
Vice-President, Investment Bankers Association of America

UNTIL very recent years, the approved corporate policy was one of silence, not publicity. Public utility companies were no exception. The value of good salesmanship on the part of the managements of the public utilities and of the good will of the public served was not sufficiently emphasized as an essential element of success in the business. Demonstrations of public interest were not always welcomed. The value of a monopoly for a long term of years was frequently overestimated. The public, on the other hand, utterly uninformed, believing such monopolies immensely profitable, often irritated by inefficient and insufficient service, was naturally resentful.

Such a state of affairs, though perhaps perfectly natural to the experimental stages of a new and rapidly developing industry, furnished a fertile soil for the seeds of suspicion, so cheerfully and successfully sown by the demagogue; and, it yielded an abundant crop of popular distrust, hostile legislation and, for a time, unintelligent regulation. It is easy to understand how difficult it was at first for even an able, intelligent and conscientious regulatory body, as most of them undoubtedly were, to do justice to the utility companies in face of so much adverse public sentiment. Fortunately, the utility companies, the public and the regulatory bodies have been learning in the school of bitter experience and they now seem to have entered an era of clearer perceptions and better mutual understanding and appreciation. That this better mutual understanding is contributing to the removal of many troublesome obstacles is indicated by the following, among many, incidents which have been reported:

After experience with jitney service, Battle Creek and Muskegon, Mich., voted overwhelmingly (it is reported four to one) for street car service.

Kansas City, Mo., has enacted ordinances forbidding jitneys on all streets on which street cars operate and the ordinances have been sustained by the courts.

The officials of the city of Okemah, Okla., had prepared to issue $90,000 bonds to build a municipal gas plant but the citizens, by a vote of 577 to 3, voted a franchise to a private company. A few hours later, the mayor and the citizens built a "bonfire" with the $90,000 of bonds in front of the City Hall.

The city officers of Sault Ste. Marie insisted that the street car company pay for certain paving between its tracks which the company claimed it was unable to pay. The question was referred to the Public Utilities Commission of the State of Michigan, which held that the company might suspend operation July 15, if the city insisted on the company paying for the pavement.

Constructive Educational Work Desirable

Furthermore, there seems to be a better appreciation of the value and necessity of public utility service and a growing desire on the part of the people and of public officials for reliable and complete information in regard to the public utility business. Your committee is informed that the University of Detroit will establish, beginning the next academic year, a comprehensive course in public utilities, including the principles of regulation, finance, public relations and other fundamentals; and, that Massachusetts Institute of Technology, Princeton, Ohio State University and other leading schools have established similar courses within the last few years. This public desire should be promptly met and cheerfully gratified.

In the last report of your committee[1] a brief account was given of the condition of the public utility industry from an investment banking standpoint, the need of fresh capital for development and expansion to maintain good service and keep pace with public demand, and of the conditions requisite to the ready inflow of such new capital. Your committee has been somewhat surprised in view of the rather limited publicity given the report, at the expressions of interest elicited in the financial features of the utility business.

As an illustration, the presiding officer of one of the most widely known state regulatory bodies writes as follows:

> I wish that members of legislatures could have access to this report and other data of a similar nature. The ignorance of our legislature upon such matters as this is astounding. If the I.B.A. of A. could get reliable information upon such subjects to the members-elect before the Legislature meets, they would be much more effective than anything that might be presented in committee or otherwise while the legislature is in session.

The requests for copies of this report, for purposes of distribution, are such that a reprint will be necessary. A more or less widespread public recognition of the primary necessity of the free flow of capital into the public utility business seems to be developing as well as deepening interest in the methods, conditions and cost of obtaining it. This is evident, not only from the dicta of regulatory commissions and courts, but also from articles and editorials appearing lately in leading magazines and newspapers. It appears to this committee that this public demand for information concerning the financial problems of the public utilities should be met by this association, and that it presents an invitation to do constructive educational work concerning sound financial principles and practices, which should not be overlooked or neglected.

---

*Abstract of interim report of the committee on public service securities of the Investment Bankers' Association of America, adopted by the Board of Governors July 22, 1922.

[1] See *Electric Railway Journal*, June 10, 1922, page 941.

Prior to the organization of this association the investment banker was himself reserved and silent. As with the public utility operator it was his conventional policy. Times have changed and we must keep pace with them. Public confidence is no longer blind but is demanding definite knowledge as a basis. The work of this association has already accomplished much, but it should be carried forward consistently. More intimate contacts should be established and maintained with regulatory and legislative authorities, and we should do our part in developing an intelligent public opinion upon public utility matters and a more general understanding of the character, quality and value of the services rendered by investment bankers.

STATE OF PUBLIC UTILITY CREDIT

Since the last report of this committee the decline in interest rates has induced or permitted a considerable increase in the volume of refinancing of maturing senior securities of light and power companies, and there has been a noticeable increase of junior financing. Such financing, however, has been expensive and chiefly confined to the larger companies and those of the highest established credit. The average smaller company has not as yet been greatly benefited. While there has been some refinancing of maturing senior obligations of electric railways at high rates, there has been almost a total absence of junior financing. No new projects have been developed and practically no extensions of existing lines are being built.

The greatest single present problem of the electric railways is how to obtain new money particularly through junior securities for the extensions and betterments necessary to maintain satisfactory public service.

It is of course obvious to the investment banker and is becoming more apparent to the public served and to public officials that at least two fundamental conditions must be met before new money will flow freely into junior securities.

1. There must be a sufficient assurance of the safety of principal; and

2. There must be reasonable assurance of a regular and uninterrupted return on sound investment value in the business, and this promised return must be not only "fair" but adequate and attractive.

As has been previously stated, this committee has faith in the fundamental soundness of the electric railway business but the investing public evidently has not forgotten the threats of loss due to restrictive legislation, unfair competition, popular misunderstanding and other causes. However, increasing earnings, saner regulation and a more intelligent popular appreciation of the indispensable necessity and value of electric railway service are reassuring influences which appear to be working towards a restoration of the investor's confidence in electric railway securities.

That the necessity of not only a "fair" but also an adequate return is gaining in public recognition is apparent from recent articles and editorials in leading magazines and newspapers. As samples, we quote the following from an article in a leading magazine of national circulation:

> Practically everyone who has money strives to invest it where it will bring the largest return with the greatest degree of safety. If anyone is offered an investment in a public utility that pays 5 per cent and just as good an investment in something else that pays 8 or 10 per cent, it is an absolute certainty that the investment netting the largest return will get the money. Let no one overlook the truth that money is a commodity which we buy and sell just as we buy and sell clothes and lumber. A public utility or a municipality cannot buy money for less than other people pay for it any more than this same utility or municipality can buy coal or labor for less than it is worth in the market.

And the following from an Illinois editor in whose town the street car company was seeking a new franchise:

> The prosperity of this country has come because it has been possible to make money in this country and to keep a fair share of what was made. Prosperity comes to an end when profits are taken away as fast as, or faster than, they are acquired. . . . The tendency of the last quarter of a century has been to make organization unprofitable; to put a damper on incentive and to take away any profits faster than they were earned.
>
> Remember this: Destroy the money-making possibilities of any enterprise and you wipe out entirely the possibility of the service it can and should render.

All of which is doubly applicable to the flow of money into junior securities where it is now most needed, and indicates a healthy and hopeful change in public sentiment.

National Safety Council

ARTHUR W. BRADY, president Indiana Union Traction Company, Anderson, Ind., will speak at the joint luncheon of public utilities and electric railway sections of the National Safety Council at the Detroit Athletic Club on Wednesday, Aug. 30, the third day of the Eleventh Annual Safety Congress at Detroit, Mich., Aug. 28 to Sept. 1. Alexander Dow, president Detroit (Mich.) Edison Company, will be the other speaker at this luncheon. The chairman of the joint luncheon meeting will be Homer E. Niesz, manager industrial relations department, Commonwealth Edison Company, Chicago.

C. B. Hardin, general claim agent United Railways of St. Louis, C. E. Morrison, vice-president and general manager, Utilities Mutual Insurance Company, New York, and Harry J. Bell, secretary Chicago Safety Council, will discuss the subject of "Progress in Accident Prevention in Public Utilities," on Tuesday morning. "The Financial Side of Accident Prevention" will be considered in a paper by Garrett T. Seely, vice-president and general manager Pennsylvania-Ohio Electric Company, Youngstown, Ohio. The discussion will be led by Harry B. Lucas, treasurer Philadelphia (Pa.) Electric Company, and G. T. Hellmuth, general claim agent Chicago, North Shore & Milwaukee Railroad will follow.

On Thursday morning, President Britton I. Budd, president Chicago Elevated Railways, will address the safety men on "The Human Side of Our Business." W. H. Boyce, general manager Beaver Valley Traction Company, New Brighton, Pa., and S. H. Reid, Bureau of Safety, Chicago, will lead the discussion on this subject.

Co-ordination between engineering and operating ends of the business from the standpoint of safety will be the subject of a talk by H. J. Warnick, engineer, Northern Indiana Gas & Electric Company, Fort Wayne, Ind. Discussion will follow led by F. W. Fisher, safety and employment manager, Rochester Gas & Electric Corporation, Rochester, N. Y., and Wills Maclachlan, electrical engineer, Canada.

J. F. Naylon, division equipment superintendent of the New York Telephone Company, will be the chairman of the Tuesday morning session. B. D. Haskins, Chattanooga Street Railway, will preside at the Thursday morning session.

Program of Wisconsin Meeting

THE complete program for the summer meeting of the railway division of the Wisconsin Utilities Association, to be held in Green Bay on Aug. 17 and 18, is as follows:

Morning Session, Thursday

Address of welcome by Mayor Weisner, Green Bay, and response by President J. P. Pulliam, Wisconsin Public Service Company, followed by opening address by Chairman B. W. Arnold, Eastern Wisconsin Electric Company.

Paper on "Proper Maintenance and Lubrication of Railway Bearings," by H. Cordell, Chicago, North Shore & Milwaukee Railroad.

Paper on "Proper Maintenance of Brakes and Brake Rigging," by O. R. Hill, Rockford & Interurban Railway.

Afternoon Session, Thursday

Inspection Trip—Wisconsin Public Service Company, lines and shops. Demonstration of steel ties, track construction, welding, etc. Baseball and field events at Bay View Beach Park. Swimming and water sports.

Banquet, Bay View Beach Tea Room. Address on "The Electric Railway Industry in 1922," by Labert St. Clair, director advertising section American Electric Railway Association.

Morning Session, Friday

Paper on "Regulation of Service Schedules to Suit Traffic," by Nels Rasmussen, Wisconsin Valley Electric Company.

Paper on "Safety First Practice," by C. E. Warwick, Wisconsin Public Service Company.

Round Table discussions on methods of developing traffic, collection of fares on one-man city and suburban cars, and steel ties against wood ties.

The headquarters will be at the Beaumont Hotel, Green Bay.

F. A. E. S. to Discuss Length of Working Day

AT A MEETING of the executive board of the American Engineering Council, Federated American Engineering Societies, to be held at Boston Sept. 8 and 9, two reports dealing with exhaustive investigations of the two-shift and the three-shift-day problems in numerous industries will be presented. The reports will cover transportation and other utilities, as well as manufacturing industries of the continuous type.

Dean M. E. Cooley, University of Michigan, successor to Herbert Hoover as president of the federation, will preside at the Boston meeting.

Industrial Engineers to Meet

THE Society of Industrial Engineers will hold a three-day national convention at the Hotel McAlpin in New York City beginning Oct. 18. "Economics of Industry" will be the general topic of the convention. On the evening before the convention, there will be a joint meeting of this society with the Taylor Society and the American Society of Mechanical Engineers.

American Association News

Washington Coal Representative Appointed

COL. JOHN PRICE JACKSON has been appointed executive representative for the American Electric Railway Association, National Electric Light Association and American Gas Association with offices at 949 Munsey Building, Washington, D. C., to handle coal matters for these three utilities associations. This important step has been taken to protect the vital interests of the utilities in view of the emergency created by the present strike of coal miners and railroad employees. Mr. Jackson was engaged by the Joint Fuel Committee of the three associations, of which John W. Lieb of New York City is chairman. Member companies of the associations are requested to communicate directly with Colonel Jackson on all matters with respect to the coal situation.

Colonel Jackson was formerly dean of engineering and professor of electrical engineering at Pennsylvania State College. He has served as commissioner in charge of the Pennsylvania Department of Labor and Industry, chairman of the Pennsylvania Industrial Board, and during the war was chief of the Labor Bureau and deputy director of the Army Service Corps. More recently he was manager of the industrial relations committee of the Philadelphia Chamber of Commerce.

The association is again sending out a questionnaire at the request of the national government to secure immediate information on stocks of coal and fuel requirements. The railway association urges complete co-operation in compiling these data in order that the joint fuel committee and the Washington representative may have the essential facts for use in working with the federal officials.

Safety at the Convention

THE safety committee has sent a letter to the manufacturer member companies of the association asking them to "play up" safety as a selling point in their advertising and in their exhibits at the Chicago convention. Attention is called to recently published material on the subject of safety, including the July 22 issue of the *Electric Railway Journal*, and to the fact that the safety committee will have a large display of safety advertising material itself at the convention. Manufacturers are asked to send the chairman of the committee copies of safety literature which they may have gotten out to be included in this display.

Convention Entertainment Features Being Arranged

THE convention committee on entertainments met on Aug. 2 in the office of J. V. Sullivan, chairman. The progress reports brought in by various sub-committees showed that the entertainment features at this year's convention promise to be most attractive.

Arrangements are being made by N. G. Symonds with about fifteen golf clubs around Chicago to allow those attending the convention to play, though no tournament will be arranged. It was tentatively planned to have a special card printed with the A.E.R.A. seal on it, and to purchase souvenir pencils for distribution to the players.

On the basis of information brought in by E. E. Kretschmer, there will be an orchestra of eight men at the reception space on the Pier for four afternoons. He was authorized also to engage an orchestra for the evening of the formal ball at the Drake Hotel. On the recommendation of W. H. Beattys, Jr., tea service for four hundred people will be provided in the reception room for the same four afternoons. An auto trip around the park system and to other places of interest in Chicago has been planned for the entertainment of the ladies on Tuesday.

All the committee was in favor of the program for the feature night on Wednesday at the Marigold Gardens, as proposed by the sub-committee of which Frank Johnson is chairman. Secretary Welsh suggested the tickets for the feature night be assigned according to priority of applications up to some deadline that will be set, after which tickets will be sold without regard to location. In this way it was thought that much of the confusion could be avoided in making last-minute assignments of tables.

Those present were J. V. Sullivan, chairman; N. G. Symonds, H. J. Kenfield, E. E. Kretschmer, W. H. Beattys, A. P. Jenks, Frank Johnson, Mr. Wright, Labert St. Clair, Secretary Welsh, and D. F. Hine representing H. L. Brown.

Engineering Executive Committee

A MEETING of the executive committee of the American Electric Railway Engineering Association was held in the New York office on Aug. 9 to go over the reports of the papers to be presented at the Chicago convention and the transaction of other business. There was a good attendance, those present being C. W. Kimball, Washington, D. C., president; L. C. Datz, Birmingham, Ala., vice-president; and R. C. Cram, Brooklyn, N. Y.; Charles R. Harte, New Haven, Conn., and Daniel Durie, Connellsville, Pa., members of the executive committee. Working in connection with Mr. Hecker, the association engineer and Secretary Welsh, many topics were considered and rapid progress was made.

Helpful Reports Issued

THE following special reports and compilations prepared by the bureau of information and service of the American Association are now available to member companies in good standing upon request:

Public Utility Laws: A summary of the laws creating the state public utilities commissions, giving an analytical digest of the main provisions covering their jurisdiction and powers over transportation companies. The third installment of the compilation began in June.

Securities Issued by Public Utilities in 1922: A list of new public utilities securities, divided between electric railways and other utilities and showing the name of the issuing company, the amount of the issue, the rate of interest and the offering price.

Practical Experience with Welfare Work: A collection of statements of industrial companies gathered by the National Industrial Conference Board, giving a brief outline of experiments with welfare plans, the results obtained and expressions of opinion as to their value.

List of Cities in Which Safety Cars Are Operated: Showing number of safety cars operated in each city based on data furnished by manufacturers.

Use of Transfers and Reduced Rate Tickets: Shows for a number of companies the cash fare and ticket rate in 1921 and 1920 and the percentage of revenue passengers using tickets and using transfers in both years.

In addition to the above supplements to the fare bulletin, the wage bulletin and the cost of living studies have been prepared bringing them down to date.

PERSONAL MENTION

San Diego Franchise Refused

Company Will Carry the Franchise and Paving Questions Direct to the Public

Following refusal of the Common Council of San Diego, Cal., to grant to the San Diego Electric Railway a franchise to lay tracks on Sixteenth Street, the company has decided to carry the issue direct to the people. It is causing initiative petitions to be circulated, asking the Council to submit the question to the electors at a special election to be called for that purpose. At the same time petitions are being circulated by the company initiating an amendment to the city charter to eliminate the present charter requirements imposing a 2 per cent franchise tax and requiring the company to maintain the pavement between the car tracks and for 2 ft. on each side of the tracks.

Petitions Signed Liberally

Both petitions are being liberally signed. It is expected to submit them to the Council within the next few days, when it is believed, at least 8,000 signatures will have been attached to each petition.

The proposed Sixteenth Street franchise follows present charter provisions and prescribes in general the same terms and conditions as the general franchise held by the company. It is drawn to expire on Sept. 1, 1952. The application is for four blocks of double track, from Market to Broadway on Sixteenth Street, equivalent to nearly one-half mile of single track.

In a newspaper publicity campaign following its original application for the franchise, the company stated the franchise was desired for two reasons:

Reasons Franchise Is Desired

1. To give better service to workmen and navy men employed at the new naval repair base at the foot of Thirty-second Street, by providing a cross-town cut-off and eliminating the longer ride to the Fifth and Broadway transfer point.

2. To save money in getting cars to and from the carhouses.

Claus Spreckels, general manager, asserted that the saving in wear and tear on equipment and in time because of the shorter haul would be at least $10,000 a year. The company proposed, if the franchise were granted, to route National City and Logan Avenue cars to the downtown section by way of Sixteenth Street and Broadway instead of the present route of Market Street and Fifth Street.

This proposal resulted in arousing violent opposition on the part of merchants and property owners on lower Fifth Street, who contended that lessened car service on Fifth Street and Market Street would result in a loss of a great amount of business to them. The railway management claimed that car service would still be ample, as the Imperial Avenue, Market Street and Woolman Avenue routes would continue to serve that district.

The political power of the merchants prevailed, however, and the company's franchise application was rejected, with the result that the company has invoked the initiative to gain its ends. Business men of upper Fifth Street and Broadway, the heads of the school system, the naval commanders and many other prominent citizens have expressed themselves in newspaper interviews as in favor of the new routings proposed by the company.

The proposed charter amendment initiated is along the lines recommended by the State Railroad Commission and follows an act of the last Legislature, designed to relieve electric railways of paving burdens and the 2 per cent franchise tax, and to give power to the Common Council to grant indeterminate term franchises hereafter, and to make resettlement of present existing franchises to conform to the new amendment.

Text of Amended Section

The text of the proposed amended charter section is as follows:

Sec. 9. Every franchise or privilege to construct or operate street, suburban or interurban railroads upon any public street, highway or public property in the city of San Diego hereafter proposed to be granted by said Common Council shall be granted for such period of years and upon such terms and conditions and in such manner as the general laws of the State of California in effect at the date of application for such franchise or permit provide, and upon such terms and conditions as are not in conflict with general law which said Common Council may in the ordinance granting such franchise prescribe.

The Common Council shall have power and is authorized to provide for a general resettlement of the franchise rights of and to grant a resettlement franchise for an indeterminate period to any person, firm or corporation actually engaged in operating a street, suburban or interurban railroad in the city of San Diego upon written application therefor, upon such terms and conditions and in such manner as the general laws of the State of California in effect at the date of application for such franchise provide. And said Common Council in such resettlement of any such franchise may impose such other and additional terms and conditions as are not in conflict with the general law and which said Common Council may in the ordinance granting such indeterminate franchise prescribe.

The company has also applied to the Common Council for franchises on Twenty-fifth Street and Market Street as follows: On Twenty-fifth Street from Broadway to K Street, standard double-track line, equivalent to a mile of single track; on Market Street from Twenty-fifth to Thirty-second Street, single-track line of light construction, approximately 1 mile long, the company to be relieved of filling in requirements for five years. These franchises have been recommended for passage, but have not been finally acted upon.

No Surface Car Service Order

The New York Transit Commission has announced that no specific general orders will be issued regarding improvement of service on the surface lines, as had been done in connection with the rapid-transit companies. General Lincoln C. Andrews, chief executive officer of the commission, is to have complete charge of matters pertaining to surface transportation, subject to appeal by the companies to the commission. Representatives of sixteen surface lines and systems who were present at a conference before the commission on Aug. 3 agreed to the proposal.

General Andrews was asked by Chairman McAneny to give his conclusions based upon the investigation of the commission into service on the surface lines. He said:

> The appearance of the cars, their cleanliness and suitability for service, the courtesy of the employees, the safety and efficiency of operation—in fact, everything that goes to make operating service attractive and tends to sell it to the public, are matters of pride as well as of personal responsibility to the operator.
>
> I believe that the commission can secure far better service for the public from the surface companies by leaving this responsibility in the first instance upon the operator and holding him to it, and by setting up proper standards of service to be met by progressive steps as rapidly as the condition of each company permits. With the conclusion of the intensive work done in connection with the valuation department, I shall be able to start a reorganization of the work of the Transit Bureau which will enable us to keep in closer touch with the daily work of the operating companies. We should thus be able, through the co-operation of the companies, to improve the details of operation until ultimately New York may be given a street car service of the sort it is entitled to have—the best in the country.

Experts from Other Cities Will Assist in Investigation

Traction experts and city officials from other cities will be asked to appear before Mayor George P. Carrel's street railway committee to assist that committee in its investigation and consideration of the railway problem in Cincinnati, Ohio.

The resolution provides for the appointment of a sub-committee of five to function during a six-weeks' vacation period which the committee will take this month and part of next month. The committee will make its report at the next meeting of the general committee, Sept. 11.

Under the resolution the sub-committee will have authority to investigate and report on the expense of employing expert accountants and traction experts and the character of the reports that are to be obtained. The committee also will be authorized to receive from the Cincinnati Traction Company and the Cincinnati Street Railway any proposition of adjustment which the companies may desire to offer.

Confusion in Handling Traffic and Commuters at the Chicago & Northwestern Railroad Station

Chicago Rides Again

Surface and Elevated Transportation Resumed on Aug. 7 After Six-Day Tie-Up—Men Accept 12½ per Cent Wage Reduction—Company Yields Every Point on Working Conditions—"L" May Ask for Fare Cut

CHICAGO returned to transportation normalcy on Sunday night, Aug. 6, after a six-day tie-up of both elevated and surface traction systems. The resumption of both elevated and surface transportation came after the men had ratified by a two to one vote the agreement reached on Aug. 5 by their leaders to accept 70 cents an hour, a 12½ per cent wage reduction. The company yielded every point on working conditions, including continuance of the eight-hour day and all existing rules covering pay for fall-back, layover time, meal time and reporting time.

The new scale on the elevated will be 72 cents per hour, or 2 cents higher. It was announced by Britton I. Budd, president of the elevated lines, that Gilbert E. Porter, chief counsel for the company, will go before the Illinois Commerce Commission in the near future and ask for a revision downward of the fare rates.

The old "L" wage scale of 82 cents an hour will remain in force until the fare is lowered by order of the commission. This order is expected about Sept. 1. At that time it is believed the cash fare will be reduced from 10 to 9 cents. This penny reduction, the company estimates, will mean an annual loss in revenue of $1,800,000, while the 10-cent wage reduction will amount to an annual saving of only $1,100,000.

The complete new scale for the elevated trainmen is as follows:

	First Three Months	Next Nine Months	After One Year
Motormen	66	67	72
Conductors	65	65	66
Extra Guard	62	63	64

Regular guards will receive 65 cents an hour after one year of service and the pay for towermen will range from 75 to 79 cents an hour. All these figures carry a flat 10-cent reduction. All other classes of elevated employees will receive wage reductions in the same ratio of approximately 12.2 per cent.

The Surface Lines is still nogotiating with the eight remaining unions to bring about an equal downward revision of their wages. These unions include the track men, substation operators, certain shop men, line men, etc. Some of the shopmen are included in the agreement with the trainmen. Besides these reductions in wages the company will have to reduce its expenses for maintenance, materials and damages, and effect other economies to make a living rate of return.

The settlement of the strike was reached after Henry A. Blair, president Chicago Surface Lines, and the

State Street Looking North from Madison, Showing the Volume of Traffic Which Had to Be Handled with One-Way Rules in the Strike

Vehicular Congestion at State and Madison Streets, Madison Being the Point at Which the Direction of One-Way Traffic on State Reversed union committee had whittled their differences until they were only 4 cents apart on their figures, the union holding out for 72 cents and the company bettering its former compromise offer of 65 cents by 3 cents. The whirlwind finish of a situation which had caused carless streets for an extended period and which was leading toward a probable attempt to operate the cars with strikebreakers, came after Mr. Blair summoned the aldermanic-citizens committee and the president of the Chicago Association of Commerce to participate in the conferences. Four hours of continual pounding away and exhorting by these committees finally brought the contending parties together, the company's board of control agreeing to what it says will practically wipe out its profits in making the concession.

The wage controversy of the Surface Lines in short was as follows:

	First Three Months	Next Nine Months	After One Year	Night Runs
Old wage	75	78	80	82
Company's offer	55	58	60	62
Company's first compromise	60	63	65	67
Union's first compromise	67	70	72	74
Final settlement	65	68	70	72

The Surface Lines employees, it is understood, will agree to a clause in the contract with the company by which wages may be changed after thirty days' notice in case a further adjustment in fares is ordered by the Illinois Commerce Commission. The union men accepted the thirty-day clause after the company had withdrawn its opposition to the eight-hour day.

The acceptance of the 70-cent scale by the company, which is 5 cents higher than wages paid to any other street railway men in the country, will mean a reduction in operating wages of approximately $4,000,000 a year to the company. The revenue figures from June 15, 1922, when the 7-cent fare was put into effect, until July 31, show a decrease in revenue of $813,000 compared with the same period last year. Thus it would seem that the average decrease in daily revenue for the forty-seven days that the lower fare has been in effect is $17,300 while the reduction in wages takes up approximately $11,000 of this amount. The actual decrease in revenue from the beginning of the fiscal year, Feb. 1, until July 31, is $595,000. For the first four and one-half months of the fiscal year under the 8-cent fare there was an increase of about $218,000 in revenue or about 1 per cent. The fare reduction of 1 cent has more than wiped out this increase and leaves the cumulative earnings up to July 31 $595,000, or 2 per cent, behind last year's figures.

Perhaps one of the most amazing circumstances of the strike was how the people adapted themselves to a carless life. It was the spectacle of the second largest city in the United States showing the world for the third time in as many years that even a tie-up of its habitual transportation could not completely throttle its industry. No one seemed to be depressed on the first day of the strike, which had the appearance of an annual holiday until it began to rain, and then enthusiasm was somewhat dampened.

The way in which the suburban steam roads came to the rescue aided materially in lessening the traffic tangle. During the strike, the Illinois Central Railroad abandoned all schedules during rush hours and operated trains at one and one-half minute intervals. This road handled an average of 150,000 passengers daily for the five week days of the strike and about 63,000 on Sunday. The normal week-day traffic on the Illinois Central is 73,500 passengers and on Sundays 25,725. A statement published by the Chicago & Northwestern Railway shows that on the first day of the strike, that road carried 110,000 suburban passengers, business which required 225 trains. On the next three days of the strike approximately 135,000 passengers were carried daily and 243 trains were operated per day. On a normal business day the average number of passengers carried in and out of Chicago by the suburban trains on the Chicago & Northwestern is approximately 60,000 and the number of trains necessary to handle this business is 166. No definite figures are available for the other steam roads giving suburban service, but it is estimated that the Chicago, Burlington & Quincy Railroad carried about 40,000 passengers daily while the Rock Island, the Pennsylvania, and the Chicago, Milwaukee & St. Paul roads handled almost 100,000 passengers daily on suburban runs.

PEOPLE'S OWNERSHIP
FARE 5¢
CITY HALL to KEDZIE AV.

One of the Mayor's Borrowed Buses

The Chicago Motor Bus Company also did its utmost to cope with the situation, and on it fell the task of transporting the north shore passengers, who had no suburban steam road to fall back upon as did those living on the south shore. These buses coming only to Randolph Street instead of into the loop and running from 5 o'clock in the morning until 1 o'clock at night, carried 40 per cent more passengers than normally. Of the seventy-five buses, practically all were in service continuously and the completion of five new buses recently was a welcome addition to the fleet. Although generous invitations were extended by the city administration to outlying bus companies to bring their vehicles into Chicago, few responded and it is doubtful whether the total exceeded fifty.

Most of the jitneys were resurrected for the occasion and many trucks were equipped with improvised seats. The market for stepladders was reported to be very active during the strike. Prevailing fares were 25 cents, but as competition increased, some reduced the cost of the ride to 15 cents. Even cheaper rides than this were furnished by a few buses which were borrowed by Mayor Thompson. This was about the only help that he gave during the strike and he is reported to feel satisfied that he has kept his 5-cent fare pledge. Many large concerns ran special fleets of trucks for their employees.

Privately-owned automobiles on all routes of traffic filled the large gap between these means of emergency transportation and the 2,500,000 daily rides that are usually furnished by the surface and elevated lines. It was estimated that one-quarter of the automobiles in Illinois, or about 200,000, were in operation in Chicago during the strike and each operator did his bit by keeping all the seats filled.

Fortunately, the duration of the pre-strike negotiations gave time for the city officials to formulate some traffic scheme that could be put into effect immediately with the cessation of car service. The streets in the downtwon loop were put on a one-way basis and the manner in which this traffic regulation worked out has led some to believe that one-way streets must become permanent. Major R. F. Kelker, city traffic expert, declared that the strike proved that one-way streets are a decided asset in Chicago and he has already been requested to draft a new plan for routing surface cars whereby the one-way streets can be retained. He realizes though that such a rule would require the conversion of rolling stock for entrances on both sides and that nearly all special track work would have to be reconstructed.

Business in the shopping district downtown and outside, it was estimated, suffered losses of about $1,000,000 per day. This was in retail sales, which, since the strike started, appeared to fall off about one-third in volume. It was estimated that an average of 300,000 persons kept out of the loop district each day who otherwise would have come downtown.

For the Commonwealth Edison Company, which furnishes all the power used by both the Elevated and the Surface Lines, the strike came at a most opportune time. It resulted in a saving of 1,900 tons of coal daily or a total of about 11,400 tons. The railway load in Chicago is about one-third the total carried by the Commonwealth Edison Company. With coal prices nearly doubled and reserves for about thirty-six days only, and a ten days' supply en route, this saving eased the tension in this direction slightly.

The illustrations which accompany this account of the strike are reproduced by courtesy of the Chicago *Evening American.*

Court Ousts Jitneys

Transportation Emergency Does Not Exist Where Lawless Element Intimidates Passengers

Justice Charles A. Pooley in Supreme Court in Buffalo has handed down a decision directing Mayor Frank X. Schwab to enforce the state law and prohibit the operation of jitney and bus lines within the city of Buffalo. The decision follows the mandamus action brought by the International Railway because of the Mayor's refusal to stop the operating of jitneys although normal service is being maintained on all local and interurban lines which are operated by the International under Mitten Management.

Immediately following the handing down of the decision Mayor Schwab issued an order cancelling temporary jitney permits he had issued at the outbreak of the strike on July 1. Police were ordered to arrest jitney drivers who solicited passengers or charged a fare. Members of the Buffalo Jitney Owners' Association, however, are operating automobiles, depending upon passengers to make a donation. An effort was to have been made late in the week to break up this practice.

In his decision ordering Mayor Schwab to enforce the law regulating jitney and bus lines, Justice Pooley says that, "aside from any question involved in the origin and progress of the street car situation, the law is plain and no argument is attempted to refute it." The Weatherwax vs. Watt case Albany 118 N. Y. Supp., 559 is cited by Justice Pooley. This decision was upheld by the appellate division. In his decision, Judge Pooley said that a small fraction of the population seeks to defy the law by wrecking the cars and assaulting men who attempt to operate them, as well as the men and women who attempt to ride in them. As a result a complete railway is practically at a standstill so far as its use by the public is concerned, and the substitute offered is an illegal attempt to perform the service. "This plain defiance of the law," says the court, "is presented as a basis for requesting the declaration that public convenience and necessity require the substitute service. The writ of mandamus may issue."

The Public Service Commission has notified the municipal authorities that it cannot grant the city's application for a certificate of public convenience and necessity to operate motor buses in the city streets and for permission to issue permits for operating buses to jitney drivers. In denying the city's application, the commission says it finds that the city has not the power either under its charter or any other special or general law to operate jitneys or bus lines.

In his arguments before Justice Pooley, Henry W. Killeen, counsel for the International Railway, blamed the Mayor for the Buffalo strike. He charged that the strike is being run from the Mayor's office and that the business agent for the union collaborates with the Mayor in issuing all statements regarding the strike.

Justice Pooley interrupted the arguments to explain his views on the situation. He denounced strikers and their sympathizers who are intimidating passengers, stoning cars and hurling acid at loyal employes. He said, however, that the only question before the court was whether jitneys were being operated in the city in violation of law.

Mr. Killeen argued that it is the duty of the Mayor as commissioner of public safety and head of the police department to order the chief of police to direct the arrest of all jitney drivers. He argued that as long as the Mayor is in sympathy with the striking carmen and refuses to enforce the law, it is the duty of the court to mandamus him to enforce the law and he cited the Albany case where the court ordered the commissioner of public safety to drive the jitney lines off the streets. This court was upheld by the appellate division of the Supreme Court. Judge Pooley indicated that he would follow the decision in the Albany case.

President Tulley of the International in a statement addressed to the strikers says:

> Czarlike domination by the union exists, under which men who have been a lifetime in the company's service, and who are unfitted for other work, are required to report daily to the union, under threat of bodily harm, insult to wife and abuse of children, being thus forced to remain out of work while the opportunity to get their old jobs back is rapidly slipping away.

To the owners of the stock of the International, Mr. Tulley makes this public statement:

> International Traction stock, par value of $15,000,000, was entirely wiped out by the losses of the 1918 strike and inefficient operation, due to union domination of both men and management.
>
> International Railway stockholders in 1921 were forced to contribute more than $2,000,000 by cash assessment before Mitten Management could undertake to reorganize the property so as to insure uninterrupted service to the public, continued employment to the men and an assured return to the owners.

Then in a statement to the public, Mr. Tulley explains in detail the results accomplished under the Mitten co-operative plan at Philadelphia.

Mr. Tulley made this statement on the situation to the *Electric Railway Journal*.

> Buffalo in 1901 was saved from a threatened strike during Pan-American year, by Mitten policy, and for more than ten years peace prevailed thereunder. After 1913 union control became increasingly dominant under the then management's policy of favoring the union in hope of securing industrial peace.
>
> Discipline suffered, accidents increased and, although a signed agreement between the union and company had no closed shop provision, employees were nevertheless forced to join the union.
>
> This union to extort a higher wage, which the company was temporarily unable to pay, in 1918 subjected Buffalo to the humiliation of a long drawn out strike during the wartime period when everyone worth while was forgetting self and working to help win the war.
>
> Buffalo is suffering great loss and inconvenience from the present strike, which makes it imperative that Mitten Management now plan to remove the possibility of future strikes.
>
> Mitten Management is neither for nor against organized labor, but cannot have further dealings with a union which neither recognizes the need of good railroading, nor the necessity of living up to its undertakings.

Employment Service of the Four National Engineering Societies

An employment service for engineers of every variety of training and experience is conducted by the four national engineering societies of the United States. This service brings in touch with the various business men the service of 50,000 trained technical men who are members of these societies. One of the objects of it is to show to the various commercial houses the aid which engineers are rendering to others in the same lines and to help these firms and corporations secure similar assistance.

Men of engineering training are prominent in all branches of commercial endeavor and their creative ability is recognized as being of great help in the building up of the nation.

This service is in a position to supply civil engineers, mechanical engineers, electrical engineers, sales engineers, production managers, superintendents and other trained executives. It is under the direction of W. V. Brown. His office is in the United Engineering Building, New York City. The service is free to both employer and to employee.

Motorman "On the Job" Saves Life

A motorman in the employ of the Altoona & Logan Valley Electric Railway, Altoona, Pa., has been publicly commended by general manager Crane for saving a life while operating his car late in the night.

While he was running his car below Bellwood Motorman Housel saw an electric flash. He knew at once that sign was something unusual and so he brought his car to a quick standstill. He went out to investigate and found lying on the ground a few feet away along the track, a man. The man, in the employ of the Home Electric Light Company of Tyrone, had been sent out to repair a break in the power wire. He came into contact with the heavily-charged wire and was hurled to the road. Just that one flash which occurred when he touched the wire was seen by this wide-awake motorman. An editorial in the Altoona *Mirror* says that Motorman Housel was "On the Job."

Traffic Survey Will Be Completed by August Fifteenth

John A. Beeler announces that by Aug. 15 he hopes to complete the survey now being made by him of the properties of the New Orleans Railway & Light Company. It is estimated that 250,000 observations will be required to reach an accurate idea of the changes that may be necessary to the present system so as to give the best possible service at the minimum cost. Until the work of his engineers and technical assistants is completed, however, it will not be possible to determine what reroutings should be made nor how much additional equipment will be required.

Power Improvements Planned

The Indianapolis (Ind.) Street Railway planned to present a petition to the Public Service Commission on Aug. 12 asking for permission to carry out a large program of improvements. According to Robert I. Todd, president of the company, all the financing of the project has been completed. The entire proposition links up with the question of adequate power.

Mr. Todd said recently the West Washington Street power plant was obsolete and should have been scrapped some time ago. The future power development will be made at the West Tenth Street power station. Included in the expansion and rejuvenation of the company are first, more power; then cars, new shops, new carhouses, extensions and a general overhauling of tracks. Under the proposed plans the company will build at least six and probably eight substations in Indianapolis.

Akron Company Successful at Referendum

By a majority approximating 11,000 in the City of Akron, the Northern Ohio Traction & Light Company won its franchise fight at the polls on Aug. 8. With four precincts missing the vote Wednesday morning stood: For the ordinance, 16,273; against the ordinance, 5,473. The company carried every precinct in the city except one.

The ordinance voted upon Tuesday was passed by the Council last April and a referendum election was called. It provided for:

1. A straight 5-cent fare until Feb. 1, 1924.
2. Construction of a new line across the new $2,000,000 viaduct, linking that section known as North Hill with the downtown section.
3. Establishment of eight new bus lines.
4. Rebuilding West Market Street line.

Announcing that it had faith in the voters of Akron, the company, six weeks ago, began the construction of the new line and the rebuilding of the West Market Street line. It also purchased eleven buses, which have since been delivered and put into service.

The vote Tuesday shows that the people approved the trust placed in them by the company. The Akron franchise fight began four years ago when the Morse-Witwer franchise ordinance was defeated by a vote of six to one. Since that time sentiment has materially changed and the result was the vote Tuesday.

Be a Rooter for the Railroads Not a Booster for the Bus

The set of resolutions adopted some weeks ago by the Boone, Ia., Chamber of Commerce and forwarded to Boone merchants urged the shippers of Boone to send their freight via the railroad; that the truck was only fair weather service which would stop operating in the winter. The same arguments were made with respect to the passenger buses which "daily use our public roads as right-of-way and our streets as stations." In the opinion of the board of directors of the Mercantile Board, so says the letter, there is no town in the entire State which owes more to the railroads than Boone, which has had the service of the Fort Dodge, Des Moines & Southern Electric and the Chicago & North-Western. The Chamber of Commerce tells the people to boost for the railroads—"they are your best friends." The letter, signed by the secretary, was prepared after information had been received that truck lines for handling freight had been established between Des Moines and Boone and possibly to Fort Dodge and Marshalltown and Boone.

May Electrify Line

The Eagles Mere Railroad, a steam road built in 1892 and operating between Sonestown, Pa., Eagles Mere and Eagles Mere Park, a distance (one way) of 10 miles, has been purchased and is being run by the hotel interests at Eagles Mere. It is a narrow gage road, originally 8 miles in length, but extended in 1904 to the Eagles Mere Park, making an extra distance of 2 miles, total 10 miles length.

The new owners, who have incorporated the line into the Eagles Mere Railway Company, with Herman V. Yeager as general manager, are planning many extensive improvements. It is planned first to change the line from narrow gage to standard gage and also to either electrify the road or operate a gasoline car service.

Publicity Activities Extended

In order that the publicity interests of Henry L. Doherty & Company, New York, N. Y., may be adequately presented to the newspapers and magazines addition of two new members to the New York organization is announced:

Frank L. Blanchard, former managing editor of *Printer's Ink*, has been made director of the company's publications and advertising.

George B. Walker, late secretary of the public relations committee of the American Banker's Association, is news editor.

Publication of the *Doherty News* has again been started.

Accept Four Per Cent Wage Cut

Motormen, conductors and carhouse employees of the South Covington & Cincinnati Street Railway, Covington, Ky., have accepted a wage reduction of 4 per cent. The new wage scale is as follows: 48 cents an hour, for motormen and conductors in service more than one year; 45 cents an hour for employees in service over three months and 43 cents an hour for new men.

The schedules formerly were 50, 48 and 45 cents an hour. Carhouse employees' new wage scale ranges from 35 to 46½ cents an hour. Other employees including trackmen have not been reduced. The new schedules are retroactive to July 1.

Elevated and Subway Franchise Sought in Buffalo

Dr. Carl H. Guess, 1095 Tonawanda Street, and Conrad V. Brunner, 139 Highgate Avenue, Buffalo, have petitioned the City Council of Buffalo for a fifty-year franchise to build and operate an elevated and subway system through about a dozen streets in Buffalo at an estimated cost of $75,000,000. The petition filed with the municipal authorities states that a subway would be built from the Main Street wharf at the Buffalo River to the north city line, a distance of about 12 miles, with elevated lines on Niagara Street from Shelton Square to the city line and across Hertel Avenue from Tonawanda to Main also in such east side streets as Broadway, Genesee and Fillmore. The promoters promise all-day service, but no reference is made to the fare which would be charged.

News Notes

May Operate Electric Cars.—It is reported that business men living in towns along the defunct Kansas City & Northwestern Railway have called a meeting at Seneca, Kan., to consider the proposition of operating electric cars over the line.

New Franchise Being Negotiated.—The Manitowoc & Northern Traction Company, Manitowoc, Wis., is seeking a fifteen-year franchise to supplant its twenty-year privilege which soon expires. The company expects to purchase a local bus line to provide service in the south and southwestern part of the city but before closing that deal wants assurance of exclusive rights.

In Favor of Retaining Service.—If an agreement on paving can be reached operation of the Dunkirk & Point Gratiot Railway, Dunkirk, N. Y., serving visitors to the Point Gratiot Park and bathing beach will be continued. The Common Council is willing to make changes in connection with the paving of West Front Street if the abutting property owners give their consent. The company is unable financially to bear the paving expense but is willing to raise its tracks to the level of the proposed paving.

Compiling a History.—D. E. Parsons, general manager of the East St. Louis & Suburban Railway, East St. Louis, Ill., is gathering all possible data and historical facts on street and interurban railways in Belleville and connecting this city with East St. Louis and St. Louis. No comprehensive account of railway activity in this section has ever been recorded and it is with the idea of compiling such a history that Mr. Parsons has started on this work. He has announced that he would appreciate the co-operation of those well-informed on the subject.

Financial and Corporate

Expert's Attack Resented

President of Twin City Rapid Transit Retorts Tartly to Statements Made by Dr. Wilcox

Horace Lowry, president of the Twin City Rapid Transit Company, has generally refrained from making statements concerning the serial report which Delos F. Wilcox is making to the Minneapolis City Council in connection with the appraisal of the Minneapolis Street Railway preparatory to appearing before the Minnesota Railroad & Warehouse Commission in a hearing to determine a permanent fare. He has, however, made a vigorous statement in reply to the serial issue of Aug. 2, in which reflection was made upon the founders of the company and a suggestion that they had unloaded watered stock on the public.

Mr. Lowry said in part:

> The railway will present all matters pertaining to the value of its properties to the warehouse commission as soon as the city of Minneapolis is ready to proceed with its side of the case. The company is loath to enter into any premature discussion with Dr. Wilcox concerning its affairs.
>
> However, Dr. Wilcox, in his last statement, has gone out of his way to create such an erroneous impression, that the company feels it should be corrected in justice to the public and to itself.
>
> The law provides that the company is entitled to a reasonable return on the value of its cars, tracks, shops, power houses, buildings, and all other property. Obviously, the amount of stock of the subsidiaries or the Twin City Rapid Transit Company has no relation whatever in the determination of the "fair return" on Minneapolis street railway property.
>
> By direct inference Dr. Wilcox declares that the stock of the company was unloaded on "widows and orphans," when it is a matter of public record that the stock of the Twin City Rapid Transit Company has been listed for more than thirty years on the New York Stock Exchange, and any citizen of Minneapolis, or any other place, could and can at any time purchase it.
>
> The directors of the company have been chosen by the stockholders on account of their belief in the director's business ability, and not because of the amount of stock owned by these directors. The officers have been elected by the directors due to their belief in the ability of these officers to operate the property efficiently. It is a well established fact that officers of large companies are rarely heavy stockholders of such companies.
>
> The slur cast by Dr. Wilcox upon the men who built the Minneapolis Street Railway need not be answered. The records of these men speak for themselves.
>
> In conclusion, the whole question must rest upon what the commission determines under the law to be the fair value of the property, and Dr. Wilcox's personal opinion as to the past or future action of the Minneapolis Street Railway and the Twin City Rapid Transit Company will have no bearing on the case. The company feels that it always has been fair to the public and means to continue to be so.

Mr. Wilcox said in effect that Minneapolis will never be able to get a satisfactory solution of its railway problem until it finds some way of being rid of the incubus of the over-capitalized and locally irresponsible Twin City Rapid Transit Company; that co-operation with the city in the valuation business means only that the company will accept concessions upward. As Mr. Wilcox sees it the only solution of that problem, unless it be on the company's own terms, will come from the exercise of compulsion. According to him it is evident the company had lost confidence in the State Railroad & Warehouse Commission and the State courts and would not accept the judgment of the commission on valuation unless it coincided with the company's own ideas. The impression that the Lowry and Goodrich families and their associates controlled the Twin City company through ownership of the majority of its capital stock was erroneous, as they held only a small percentage of the stock.

Taxpayers Urge Purchase Action

Owing to the actions of a special committee of city officials appointed to arrive at a valuation of the properties of the Market Street Railway, San Francisco, Cal., a resolution was introduced at a recent meeting of the Board of Supervisors asking that the matter be indefinitely postponed. It was found, however, that the unanimous opinion of the larger bodies working for the upbuilding of the city, was that the matter should not be postponed. In consequence the decision of the Taxpayers' Committee was to invite the officials of the Market Street Railway to sit down with them and go into details for the purpose of arriving at the best possible price the company would be willing to sell its properties to the city. The idea would then be to present the matter to the full Board of Supervisors with the desire that the question be placed on the ballot at one of the coming elections so that the citizens can express their opinion in reference to the advisability of the purchase of the properties. This procedure would be in accordance with the Amendment carried at the election of two years ago in favor of buying these properties and unifying the entire transportation system.

The taxpayers explain that under present conditions neither the Market Street Railway nor the Municipal Road can build extensions and that the city has been brought to a standstill in this regard. The point made in their behalf is that the people have spoken regarding this by a large majority, but that despite this the Supervisors and the Market Street Railway have so far simply interchanged letters. On this phase of the matter the committee representing the taxpayers says:

> The reasonable, ordinary business-like way to arrive at a mutually agreeable price, if possible, in so large a transaction when both parties are here in this city, is by conferences. The representatives of the Market Street Company have expressed their willingness to meet with the representatives of the city. This, the representatives of the city should do for a mutual interchange of ideas as to price, terms and how the same are arrived at. Until this is done, the representatives of the city cannot feel that they have fully discharged their duties in the matter, and to end negotiations at this time would be extremely premature.

Revised Valuation Figures Presented

Revised valuations of operating properties of the electric railways in Queens Borough were submitted to the New York Transit Commission on Aug. 7 by the bureau of valuations in concluding its appraisal of all New York City tractions for purpose of effecting a consolidation of transit facilities under municipal ownership.

Appraisal of New York & Queens County Railway property, originally valued on basis of first cost at $3,957,382, is changed to $3,370,367; on basis of 1921 prices, original estimate of $9,883,660, is revised to $9,937,286. Estimate of Long Island Electric Railway property, on basis of original cost is changed from $511,678 to $300,059; revision of appraisal based on 1921 prices increases original estimate from $1,728,528 to $1,699,717.

Revised valuation recommended for acquiring New York & Long Island Traction Company property is increased $9,729 to $466,300, while revision of estimates based on 1921 prices increases valuation from $1,335,803 to $1,340,323. Original cost estimate of Ocean Electric Railway property is increased from $268,970 to $311,086, and estimate based on last year's prices is increased from $770,240 to $773,356. Valuation recommended for Manhattan & Queens Traction Corporation property is increased $5,148 to $1,130,972, while an addition of $5,627 makes value based on 1921 prices $2,164,498. Addition of $1,170 to original cost estimate of New York & North Shore Traction Company property makes revised estimate $46,370; appraisal based on 1921 prices remains unchanged by the commission at $389,082.

In all cases, recommended valuations are based on original costs less expenditures necessary to place property in first class operating condition. Valuations at 1921 prices are after depreciation.

American Water Works Assumes Control

Control of the Potomac Public Service Company, formerly the Hagerstown & Frederick Railway, Frederick, Md., has passed to the American Water Works & Electric Company of New York. The offer accepted at a meeting of the directors of the Potomac Company was $30 a share for the common stock, the proviso being that 70 per cent of the stock would be disposed of. This condition was more than met.

The American Water Works & Electric Company, will likely have representatives on the executive committee, and on the board of directors, but outside of these representatives, there will be practically no change in the management.

The company also controls the West Penn Company, which recently closed a similar deal for the purchase of control of the Monongahela Power & Railway Company, operating in territory adjacent to that served by the Potomac Public Service Company.

All War Loans to Utilities Repaid Save Two

A statement of the present status of all loans made to public utility corporations under the war finance act has been prepared by the War Finance Corporation. It is as follows:

Appalachian Power Company, New York	$1,000,000	Paid in full
Aurora, Elgin & Chicago Railroad, Aurora, Ill	219,000	....
Brooklyn (N. Y.) Rapid Transit Company	16,566,900	Paid $22,200
Central Power & Light Company, St. Louis	60,000	Paid in full
Charleston (S. C.) Consolidated Railway & Lighting Company	350,000	Paid $13,006
Columbus (Ohio) Railway, Power & Light Company	642,000	Paid in full
Commonwealth Power, Railway & Light Company, Portland, Me.	4,800,000	Paid in full
Interborough Rapid Transit Company, New York	11,937,500	Paid in full
New Orleans Railway & Light Company	1,000,000	Paid in full
New Orleans Railway & Light Company	1,000,000	Paid in full
United Railways Compary of St. Louis	3,222,000	Paid in full

New Brunswick Company Would Sell to City

J. J. Bodell of Bodell & Company, Providence, R. I., representing security holders of the New Brunswick Power Company, St. John, N. B., has made a proposal to the city for the sale to it of the entire property of the company, including the electric railway, gas and electric light undertakings. His idea would be to have the city assume the payment of the charges on all the interest-bearing securities of the company now outstanding and pay dividends on both issues of preferred stocks, securing title to the property through gradual liquidation of the purchase price of all the common and preferred stock. He has proposed:

1. That the company deliver to the city all the common stock covered by the option.
2. That the company pay the principal amount of outstanding bank loans as of this date.
3. That the company obtain the consent of the holders of the first preferred stock to a reduction of the present annual dividend rate from 7 per cent to 6 per cent.
4. That the company obtain the consent of the holders of the second preferred stock to a reduction of the present annual rate from 7 per cent to 5 per cent.
5. That the company obtain from the trustee of the mortgage a release of the water power rights and lands owned by the company and located on the Lepreaux and Magaguadavie Rivers.
6. That the city guarantee by endorsement the payment of the principal of the bonds and interest at the rate of 5 per cent per annum thereon, and the sinking fund.
7. That the city guarantee by endorsement the payment of quarterly dividends on the preferred stock.

Sanderson & Porter, New York, were recently engaged to take over the management of the property. This change was referred to in an article in the *Electric Railway Journal* for June 10, page 949, in which the affairs of the company were reviewed.

Surplus in Montreal

For the year ending June 30, 1922, the Montreal (Que.) Tramways Company reports gross earnings of $11,712,525 against $11,773,005 for the same period a year ago. Operating expenses and taxes decreased from $6,327,841 for the year ended June 30, 1921, to $5,769,403 for the year ended June 30, 1922. After subtracting operation costs, maintenance, etc., a balance of $3,315,962 for the year ended June 30, 1922, remained. After allowance considerations, City of Montreal rental, etc., the company's statement for the year showed a surplus of $187,948, against a deficit the year previous of $239,022 and another deficit for the year ended June, 1920, of $364,700.

The company has announced that the $584,000 4½ per cent mortgage sterling debenture bonds due Aug. 1, are being retired. It is not the intention of the company to make any further issue at this time in connection with this retirement.

Service Discontinued

The gasoline cars in use on the lines of the Manhattan City & Interurban Railway, Manhattan, Kan., have been withdrawn and service has been discontinued. According to Joseph G. West, manager of the company, who announced the suspension of service, business has fallen off 50 per cent in the past year.

These gasoline self-propelled cars replaced the electric cars several months ago after the local power company had announced increased rates for "juice." The story was told in the *Electric Railway Journal* issue of July 8, 1922.

Security Issues Authorized

The directors of the newly-organized Spokane (Wash.) United Railways have authorized the issuance of $3,500,000 bonds to be covered by a mortgage for that amount in favor of the Farmers' Loan & Trust Company of New York. Issue of $1,500,000 preferred stock and $2,000,000 common stock was also authorized. The stocks and bonds have been prorated between the Washington Water Power Company and the Spokane & Eastern Railway & Power Company in payment for these two electric railway systems taken over by the new company.

Acquisition Deal Falling Through

The deal whereby the Springfield & Troy Railway was to acquire the properties of the Springfield, Troy & Piqua Railway has apparently fallen through. In consequence doubt is expressed as to the future of the traction line, which operates between Springfield and Troy, Ohio. According to H. H. Durr, chairman of the reorganization committee, the Springfield & Troy Railway secured an option on the property, but allowed it to expire without action. The deal was even carried up to the point of paying over of the initial purchase. Residents along the line have shown themselves disposed to invest in any company that takes over the line, in order to keep it in operation, as it is the only transportation service between Springfield and Troy.

Financial News Notes

Approves of Power Line Purchase.—The Railroad & Public Utilities Commission of Tennessee has approved the purchase of a transmission line by the Tennessee Power Company. The line is 21 miles long. It extends from Maryville to Knoxville. A bond issue of $250,000 has been authorized to cover part of the purchase price.

Back Dividend Declared.—According to a recent announcement of the Nashville Railway & Light Company, Nashville, Tenn., it is prepared to make the payment of $12.50 per share on the preferred stock deposited under the plan of organization of the Tennessee Electric Power Company. Dividend payments will amount to $312,500.

$5,000,000 Issue Authorized. — The Illinois State Commerce Commission has authorized the Chicago & West Towns Railroad to issue a trust deed to Harris Trust & Savings Bank as security for a $5,000,000 mortgage loan. Permission to issue $1,000,000 of the mortgage bonds dated July 1, 1922, and maturing in ten years, also has been granted.

Gold Certificates Offered.—Halsey, Stuart & Company, New York, N. Y., are offering at prices yielding from 5½ per cent to 6½ per cent $725,000 Cincinnati (Ohio) Traction Company 6 per cent equipment trust gold certificates, maturing serially 1923 to 1932. The certificates are issued under the Philadelphia plan and represent about 75 per cent of the cost of seventy-five new double-truck motor cars.

Line Ordered Dismantled.—As the result of a recent decision of Judge Luse in the District Federal Court at Superior, Wis., the old Wisconsin Interurban Electric line will be dismantled. The line operated between Madison and Portage, Wis. The expense of razing the tracks, poles and other equipment will be borne by the city of Madison. The line has been in receiver's hands since 1919.

$30,000 Considered Too High for Park.—The committee appointed by the Mayor of Pittsfield, Mass., to negotiate with the Berkshire Street Railway for the purchase of a triangle in front of the union station in Pittsfield for a public park has reported that it regards the price—$30,000—named by the company as excessive, and also that it lacks authority to consider the matter of additional franchise privileges desired by the company as an added consideration. One request made was for a permit to lay a track across City Hall Park on the north side, and another was for a location for a siding in Dalton Street. The committee states that $20,000 is the utmost that the city should pay the railway for the land.

Traffic and Transportation

Franchise Before Council

Winnipeg Railway Will Offer Reduced Fare Schedule to Secure Ten-Year Renewal

The franchise problem confronting the Winnipeg (Man.) Electric Railway is now before the City Council. The special committee on street railway negotiations has presented two reports, the majority report favoring ultimate public ownership and the minority report suggesting the city finance the company up to an estimated sum of $2,500,000 or extend the franchise for ten years as requested by the company for a consideration.

If the city will agree to postpone the first period in which it may acquire the railway utility from 1927 to 1937 the railway has made definite promises to revise the schedule of fare which will put the entire system on a 5-cent fare during certain hours of the day.

A. W. McLimont, vice-president of the Winnipeg property, does not believe that the proposal to have the city finance the company will be taken seriously. He said that there were many difficulties to be taken care of if the city should lend large sums to the company and also that the amount proposed to be advanced would not be sufficient to meet the purposes which the railway has in mind.

The company through its publication "Public Service News" has stated that besides offering reduced rates of fare it would be willing to extend its track and car service and to install such necessary motor bus service as may be agreed upon between the company and the city.

Urging no unreasonable delays "Public Service News" says:

> We believe that the present is the appropriate time to formulate a comprehensive development and construction plan for Winnipeg and an energetic start should be made looking to the provision of public services, not only to meet present immediate needs, but also to take care of the future. Any unreasonable delay will result in retarding the city's growth and development.

It will mean that within three years all fares are to be reduced to 5 cents. The plan is worked out in the accompanying table.

	AUGUST 1 1922	
Cash fare	7 cents	
White tickets	4 for 25 cents	Good at all times.
Red tickets	5 for 25 cents	Good from 6 to 8 a.m. and 5 to 6.30 p.m.
Sunday fare	5 cents cash	
Children's tickets	8 for 25 cents	Good for children under 16 at all times.
	AUG. 1, 1923	
Cash fare	6 cents	
White tickets	6 for 35 cents	Good at all times.
Red tickets	5 for 25 cents	Good from 6 to 8 a.m. and 5 to 6.30 p.m.
Sunday fare	5 cents cash	
Children's tickets	8 for 25 cents	Good for children under 16 at all times.
	AUG. 1, 1924	
Cash fare	6 cents	
White tickets	9 for 50 cents	Good at all times.
Red tickets	5 for 25 cents	Good from 6 to 8 a.m. and 5 to 6.30 p.m.
Sunday fare	5 cents cash	
Children's tickets	8 for 25 cents	Good for children under 16 at all times.
	AUG. 1, 1925	
Cash fare	6 cents	
All adults' tickets	5 for 25 cents	Good all days all times.
Children's tickets	8 for 25 cents	Good for children under 16 at all times.

Better Business—Springfield Slogan

A determined "Better Business" drive has been launched by the Indiana, Columbus & Eastern, the Columbus, Newark & Zanesville, and the Ohio Electric traction lines. Forty-eight hour freight service between Cleveland and Springfield and way points has been started, and an express freight service established between Lima and Springfield as an auxiliary to the regular freight service. Through traction freight service will also be established to Detroit and other Michigan points in the near future. Several improvements in the Springfield headquarters for the benefit of shippers, directly or indirectly, are being made.

Transfer System Will Aid Transportation Companies

With the idea in mind of increasing electric railway patronage and of aiding merchants and the public in general the Prole Transfer System was recently incorporated under the laws of California with a capitalization of $1,000,000. Under the Prole plan, named after W. A. Prole, the founder, a system of coupon transfers would be installed and a co-operative agreement entered into by transportation companies, merchants and theater managers.

Mr. Prole said that the idea would be for the public to continue to pay the existing car rates, but to receive transfers between 9 a. m. and 4.30 p. m. and 7 p. m. to midnight. These transfers would have attached to them two 2-cent coupons which would be redeemed by merchants and theatre managers on the basis of 2 cents on each cash purchase of 25 cents or multiple thereof. The system has been advertised in newspapers and periodicals.

Urges Extension

Efforts Being Made to Force Los Angeles Railway to Make Extension—Traffic Inadequate

Eleventh-hour efforts are being made to cause the California State Railroad Commission to hand down a decision ordering the Los Angeles Railway Corporation to extend one of its car lines up Vermont Avenue in Los Angeles from First Street to Griffith Park, regardless of the probable result that 10-cent fares would be ordered on all the Los Angeles Railway Company's lines in the City of Los Angeles to meet the cost of the extension. The addition would mean an expenditure of $600,000, and operating expense after completed of $6,000 per month, most of which monthly expense would represent a loss to the company, being more than the income that would be expected from the extended line.

The Railroad Commission has been made aware that a campaign of propaganda is being financed by real estate promoters, who are paying for posters and handbills which are being distributed in Hollywood urging citizens to petition the city and the commission to force the railway to extend its line to the park.

PROMISES TO INSTALL NECESSARY BUS SERVICE

Griffith Park, is rated as the largest city park in the world, and real friends of the park declare the proposed motor bus line to and from the park, connecting by universal transfers between the Los Angeles Railway line and the cars of the Pacific Electric Railway lines will have the effect, which was the long-cherished desire of Col. Griffith, donor of the park, of making it cheaply accessible to people in all parts of Los Angeles.

Chief Engineer Osborne, of the Board of Public Utilities of the City of Los Angeles, and Chief Engineer Sachse of the State Railroad Commission have worked for the past three years for the maintenance of the 5-cent carfare on the Los Angeles Railway Company's lines in Los Angeles, and it was their survey and resulting operation economies effected on the Los Angeles Railway Company's operation costs that maintained this low fare in Los Angeles when lines in other cities throughout the United States were charging from 7 to 10 cents.

The tremendous growth of that portion of Hollywood lying between Griffith Park and First Street and Vermont Avenue and Western Avenue has been recognized by the Board of Public Utilities and the commission. The problem that is now before these regulatory bodies is how to give the additional service required to serve this population and to give improved transportation from all parts of the city to Griffith Park and at the same time not force the Los Angeles Railway and the Pacific Electric Railway to make extensions that would call for capital expenditures that would be beyond the resources of these companies.

Admitting the need for extended crosstown service along Vermont Avenue to Griffith Park, Chief Engineer Osborne recommended to the Board under date of May 1 the establishment of motor bus line feeders to serve the newly built up Hollywood district.

"The Board of Public Utilities," Mr. Osborne stated in his report, which was approved by the board, "has consistently advocated the establishment of bus lines to develop new territory or to act as extensions into new territory which will not support electric railway construction." As far back as Nov. 12, 1921, the Board of Public Utilities recognized the need of improved transportation service for this rapidly developing part of Hollywood, and adopted recommendations of Chief Engineer Osborne:

Recognizing the need of giving car service to East Hollywood, the Pacific Electric Railway filed on Jan. 10, last, with the Board of Public Utilities, an application for a motor bus "feeder line" along Vermont Avenue from First Street to Los Feliz Boulevard, which is at the entrance to Griffith Park. This application is now pending before the board pending the State Railroad Commission's decision on the entire Hollywood transportation situation. The Pacific Electric Line also at the same time filed an application for a bus line permit from Larchmont Boulevard and Melrose Avenue to Highland Avenue and Cahuenga Boulevard. This second application is likewise pending until the commission makes its report.

MORE HOLLYWOOD PROPAGANDA

The State Railroad Commission in a recent decision on the matter of Pacific Electric fares ordered the company to give universal transfers to the Los Angeles Railway. The Los Angeles Railway may likewise be ordered by the Commission to give universal transfers to the Pacific Electric Lines' cars. The establishment of universal transfers in the near future will fit in with the Board's general plan for improvement of transportation conditions in the Hollywood district.

The Board of Public Utilities is taking no cognizance of the present propaganda in Hollywood for the extension of the Los Angeles Railway Company's lines to Griffith Park, for the board has repeatedly gone on record for a comprehensive plan for improved, rapid and adequate transportation service for all of Hollywood including universal transfers, a Pacific Electric subway under Bunker Hill for its Hollywood cars and lines and a larger number of cars on these lines. The Pacific Electric Railway Company is proceeding rapidly to secure rights of way and with its engineering plans for its $2,800,000 subway under Bunker Hill, and new cars, long ago ordered, are rapidly nearing completion and will soon be delivered and placed on the Hollywood service.

Jitneys Must Secure Permits from State

The Connecticut Supreme Court ruled on Aug. 4 that jitneys could not operate anywhere in the State without a permit from the Public Utilities Commission. This decision written by Justice Curtis upholds a former opinion given by Judge Booth in the Court of Common Pleas in which he imposed a fine upon Louis Darazzo, operator of a jitney between New Haven and Branford. The decision of the Supreme Court makes the jitney act constitutional and binding and gives the Public Utilities Commission full power to enforce the law.

After the general jitney clean-up by the Public Utilities Commission appeals were prepared to the Supreme Court, it being claimed that the jitney law was unconstitutional in that the Public Utilities Commission was vested with confiscatory instead of supervisory powers. All the other jitneymen except Darazzo dropped their plans to carry the fight to the Supreme Court. But Darazzo fought the case single-handed. Arrested on the charge of violating the jitney law by operating a machine over a fixed route without a license from the Public Utilities Commission, the case came to the criminal side of the Court of Common Pleas.

There was no trial of the case, however, because Darazzo refused to plead and instead demurred to the information. In the demurrer the constitutionality of the jitney law was attacked, the claims being of about the same nature as those advanced at the hearing in the federal court before three judges on the same issues. Judge John R. Booth, sitting in the criminal side of the Court of Common Pleas, overruled the demurrer of Darazzo and asked the accused to plead. Refusing to do this the court found Dazarro guilty and imposed a fine. An appeal to the Supreme Court was taken and argued at the June term.

Detroit United Will Start Interurban Motor Bus Operation

That the Detroit (Mich.) United Railway will start running interurban buses for both freight and passenger service has been announced by E. J. Burdick, the company's vice-president and general manager. Details for the company's plan have not been made public but the proposed action is the result of the study of the subject by officials and engineers of the Detroit United Railway during the past two years. The company officials have arrived at the conclusion that motorbus transportation is an inevitable progressive step that can not be deterred. Interurban transportation by automobiles, it is cited, bears the same relation to electric interurbans that they then in turn bore to the steam roads. The interurbans and the railroads have proved essential to each other and to each other's progress.

The regulation of motorbuses is considered as essential to their own welfare and to the public weal and the Detroit United Railway will look to the state for proper regulation when it has entered the field of motorbus transportation. This regulation, Mr. Burdick stated, will be up to the Legislature and the Michigan Public Utilities Commission. No legislation to curb the motorbus will be asked as it is considered that such a course would be disastrous to the motorbus field and act as a check on what is considered a new and legitimate utility.

Another point considered essential is the proper regulation of the motorbus in its use of the state highways, the companies being held responsible for compensation to the public, based upon the volume of business handled over the highways. It is further cited that if the small operator can make a profit with only one or two automobiles, the Detroit United Railway with all its resources, can prosper in the field.

Transportation News Notes

Fare Decision Expected.—The New York Public Service Commission recently fixed Aug. 8 as the last day for hearings in the Syracuse fare matter. The city of Syracuse is fighting for lower rates on the lines of the New York State Railways. A decision of the commission is expected shortly.

Trolley Routes to Be Numbered.—In order to aid visitors in finding locations the United Traction Company, Albany, N. Y., has adopted a new system for designating car routes. Each route will be given a number and all cars will display on their sign boards the number of the particular route over which they operate. The present route signs list all the streets which the car traverses.

Fifty Per Cent Ride on Passes.—During the month of July it is estimated by officials of the New Brunswick Power Company, St. John, N. B., that 50 per cent of the rides for the month were on passes. When the pass system was installed it was announced that it was only an experiment, but passes have been in vogue for eight months and evidently will be continued indefinitely.

New Checks to Be Issued.—The Pittsburgh (Pa.) Railways is having made a new kind of token, which will be larger than the old one and more convenient for the car patron, who found it difficult to locate the small check. An advantage for the company is that the Pittsburgh ticket will have straight lettering on both sides unlike most car checks which have the lettering rounded. Because of this car checks from other cities could not very well be used in Pittsburgh. It will require the circulation of 4,000,000 checks a week to accommodate Pittsburgh car riders.

New Publications

Electric Arc Welding

By E. Wanamaker and H. R. Pennington. Published by Simmons-Boardman Publishing Company, New York. 254 pages, 167 illustrations, cloth, 6 x 9 in.

Based largely on a series of articles by the authors which were published in the *Railway Electrical Engineer*, this book on electric arc welding gives information that is in most demand for practical purposes.

As both of the authors were for years connected with the Rock Island Railroad the illustrations and information are taken largely from steam railroad practice, but most of the applications are adaptable to electric railway use. A large amount of practical information on many phases of the art has been incorporated. This includes descriptions of welding systems and their installations, phenomena of the metallic and carbon welding arc, training of operators, sequence of metal disposition for various types of joints and building up operations, electrode materials used, welding ability of various metals, welding composition, thermal disturbances of parts affected by the welding process, physical properties of completed welds, efficiency of welding equipments expressed in pounds of metal used or deposited per kilowatt hour, and welding costs. The section on training operators for arc welding is particularly complete, and if the suggestions given are followed they should result in better workmanship and a broader application of the art of welding.

Railway Signaling

By Everett Edgar King. McGraw-Hill Book Company, Inc., New York City. 363 pages. Illustrated.

Professor King, who is head of the railway civil engineering department of the University of Illinois, has put into convenient form for study and reference the elements of railway signaling. While necessarily and naturally the subject is approached from the standpoint of the steam railroad, the signaling principles applicable on electrified roads are given. The treatment also includes highway signals, which are of interest to all railways crossing highways.

In appendixes Professor King gives the rules governing the construction, maintenance and operation of interlocking plants, prepared jointly by the engineers of the Railroad Commission of Wisconsin, the Railroad and Warehouse Commission of Illinois, the Railroad and Warehouse Commission of Minnesota and the Public Service Commission of Indiana and adopted by their respective commissions; a memorandum on the essentials of signaling incorporated in the report of the committee on transportation of the American Railway Association and included in the manual of the Railway Signal Association, and a set of definitions of terms used in railway signaling, taken from the Proceedings of the Railway Signal Association.

An Investigation of the Fatigue of Metals

University of Illinois Experiment Station Bulletin No. 124. Urbana, Ill.

This report covers the results of an investigation conducted at the experiment station in co-operation with the National Research Council, the Engineering Foundation and the General Electric Company, by Profs. H. F. Moore and G. B. Kommers. The tests were performed by means of the best modern available apparatus and their scope was sufficient to permit some general conclusions to be drawn, which are given in compact form. The way was also indicated for other researches which are needed to shed light on some parts of the subject.

The following significant conclusion will be read with interest:

"The phenomenon known as 'fatigue' of metal under repeated stress might better be called 'the progressive failure' of metal. The most probable explanation seems to be that such failure is a progressive spread of microscopic fractures. A nucleus for damage may be a very small area of high, localized stress, due to a groove, a scratch or a crack; in other cases failure may be due to internal inclusion or irregularities of structure; it may be due to internal stress remaining after heat treatment; it may be due to a grain or group of grains unfavorably placed to resist stress; or failure may begin in the weaker grains of a metal whose structure consists of two or more kinds of grains; or it may, of course, begin in any portion of the metal, which, by accidental overload or otherwise, is stressed to the yield point."

E. M. F. Electrical Year Book

A combined dictionary, encyclopedia and trade directory of the electrical industry. Published by the Electrical Trade Publishing Company, Chicago. 843 pages.

As its sub-title suggests, this book combines definitions of electrical terms, short articles of an encyclopadic nature, and brief descriptions of 3,000 electrical and other closely related products made by and used by the electrical industry. Each article so described is followed by a list of its American and Canadian manufacturers. Manufacturers have the privilege of inserting advertisements of a descriptive nature about their own devices in addition to the regular listing of their names under the classified products, but all such advertisements are marked with an abbreviation "Adv." It is the announced intention of the publishers to revise the information contained in this book each year to accord with the latest developments, to bring all definitions up to current usage and to correct all listings of products and producers to the date of each yearly edition.

Hydro-Electric Service Report

Third Annual Report of Government Hydro-Electric Service of the Netherlands' East India. Bandoeng, Java.

This comprehensive, beautifully illustrated report (in Dutch) contains a complete summary of the water power situation in the Netherlands' East India, particularly in Java. The report also covers Sumatra, Celebes and Algemeen. A series of appendixes contains maps and data in diagrammatic form, showing the available water powers in these colonies. The subject is of transportation interest because the Netherlands government has extensive plans for electrification in Java, where grades are steep and water power is plentiful.

Psychotechnik und Taylor-System

By K. A. Tramm, transportation engineer, Berlin, Germany. Published by Julius Springer, Berlin, 1921.

In a well illustrated book of about 140 pages, Mr. Tramm tells of the work which is being done on the Berlin street railway system in selecting and training men by means of modern psychological methods. Mr. Tramm's work was described in an article in the *Electric Railway Journal* for Jan. 28, 1922, page 143. This book covers the same field as the article, but in much more detail. In sending a copy of his book to the *Electric Railway Journal*, Mr. Tramm wrote that the tests described have worked out very well indeed.

Engineering Standards Committee

Work of the Engineering Standards Committee. 1921. Published by the committee, 29 West Thirty-ninth Street, New York City.

This pamphlet contains an explanation of the organization and methods of working of the committee, together with a list of co-operating bodies and another of projects which have an official status before the committee, including approved standards.

Pyrometric Practice

Technologic paper No. 170, United States Bureau of Standards, Washington, D. C.

Several members of the physics staff of the bureau have compiled this treatise of more than 300 pages, covering the subject of pyrometry in both its scientific and practical aspects. The work will be of value to all who have to do with the measurement of high temperatures.

"Engineers and Engineering," published by the Engineers' Club of Philadelphia, contains in its July, 1922, issue the full text of a paper on "Paving Between Tracks and Adjoining Rails" by E. J. McIlraith, Philadelphia Rapid Transit Company. The discussion following the presentation of the paper is included. Mr. McIlraith's paper was abstracted in the issue of the *Electric Railway Journal* for July 29, 1922.

Personal Mention

New York Surface Lines Report to General Andrews

Sixteen surface lines of New York City are now under the special charge of Brigadier-General Lincoln C. Andrews, chief executive of the Transit Commission. He will hear complaints, make decisions, and make known the commission's instructions. The railway companies will have the right to appeal to the commission on any decision.

This concentration of power eliminates the necessity for the commission to issue orders concerning service and equipment to individual lines. That method was followed with the rapid transit lines. General Andrews will now supervise the service, and set standards which are to be reached by the surface companies as soon as possible. The responsibility for performance and adherance to rules is left with the individual companies.

General Andrews was appointed to the Transit Bureau in 1921 to take charge of the various departments. His work consists in the assignment of duties, and the supervision and correlation of all the departments. He is a graduate of West Point, and served in France during the World War. After the armistice he became Assistant Provost Marshal General of the Expeditionary Forces.

C. H. Hardesty Chief of New Traffic Department

A department of traffic has been created by General Manager E. B. Moore of the Monongahela Power & Railway Company, Fairmont, W. Va., whose order places C. Howard Hardesty, general traffic agent, in control of the new department.

The duties of the new department manager will be to control on both the local and the Parkersburg-Marietta divisions, the passenger, freight and express traffic. He shall also have charge of the matter of rates on such traffic and shall have supervision and direction of all passenger ticket offices and freight offices and of all passenger and freight agents.

In the past the local traffic agent worked under the instructions of the manager of railways and he had no jurisdiction over traffic on the Parkersburg-Marietta divisions which was handled exclusively by the officials of that division.

L. M. Brown Made Superintendent of Interstate Property

L. M. Brown since 1917 superintendent of transportation for the Interstate Public Service Company, Indianapolis, Ind., has been appointed general superintendent of all railway property of the Interstate company. He has been with the company for seventeen years. His first position was that of conductor. Later he was made dispatcher and trainmaster, and finally superintendent of transportation.

New Springfield Manager

John S. Bleecker to Take Executive Charge of Indiana, Columbus & Eastern Traction Company

John S. Bleecker has been appointed by Receiver J. H. McClure to be general manager for the receiver for the Indiana, Columbus & Eastern Traction Company, and Columbus, Newark & Zanesville Electric Railway. The announcement was made recently at the general offices of the companies in Springfield, Ohio. Mr. Bleecker will have his headquarters in Springfield.

J. S. BLEECKER

Mr. Bleecker will step into this work as easily as an ex-service man falls into line when he drills with his two-year-old son. For Mr. Bleecker formerly managed the New Orleans Railway & Light Company, the Columbus (Ga.) Electric Company and the Columbus Railroad, and the Myles Salt Company at New Orleans. Since January of this year Mr. Bleecker has been associated with the Electric Bond & Share Company of New York, N. Y.

His experience extends to a number of other companies in Seattle, Boston, Paducah and Houghton, where he represented Stone & Webster, Inc. He was first associated with this management corporation in 1900, and the connection remained until he was appointed manager of the New Orleans company in 1919. It was while he was with Stone & Webster that he was general manager, under a receivership, of the Columbus Electric Company and the Columbus Railroad, and made a remarkable record.

Mr. Bleecker has already assumed active charge in Springfield. Mr. McClure had been devoting his full time to the operation of the two traction companies prior to his appointment as vice-president and general manager for the Chicago, Aurora & Elgin Railroad, but the latter necessitated his removing to Chicago.

Legion Cross Presented to A. E. Kennelly

For distinguished services as exchange professor in engineering to the French Republic, the Cross of the Legion of Honor has been awarded to Dr. A. E. Kennelly, professor of electrical engineering at Harvard University and the Massachusetts Institute of Technology. Dr. Kennelly was the first exchange professor sent to France from America under the scheme of regular annual exchange of professors in engineering and applied science, inaugurated last fall between the French University Administration and seven American institutions.

Professor Kennelly is the third American engineer thus to be honored recently, the others being Colonel Arthur S. Dwight, President of the American Institute of Mining and Metallurgical Engineers, and Charles F. Rand, chairman of the Engineering Foundation.

C. D. Baker is now directing transportation matters of the Long Island Railroad as general superintendent. He was formerly assistant superintendent and now is filling the position held by J. R. Savage.

Clarence H. Hitchcock, who has been chief clerk to the general superintendent, has been appointed inspector of the Rockford & Interurban Railway, Rockford, Ill. Mr. Hitchcock will have general supervision of operation.

W. N. Beasley, a lawyer of Halls, Tenn., has been appointed to the Tennessee Railroad and Public Utilities Commission by Governor Alfred A. Taylor to succeed the late Col. B. A. Enloe. Julian H. Campbell has been elected chairman. Col. Harvey Hannah is the other member of the commission. Mr. Hannah is now a candidate for the Demcoratic nomination for Governor.

Obituary

Cornelius Van Vorst Powers, chief of one of the bureaus of the New York (N. Y.) Transit Commission, died a short time ago.

Ernest A. Wenzel, for many years chief inspector in the Eastern District of the Brooklyn (N. Y.) Rapid Transit Company, died on June 24 at his home in Brooklyn.

James H. Horne, sixty-four years old, nationally known designer of passenger cars and former superintendent of the Barney & Smith Car Company, Dayton, Ohio, died very suddenly in Dayton recently.

DISCUSSIONS OF MARKET AND TRADE CONDITIONS FOR THE MANUFACTURER, SALESMAN AND PURCHASING AGENT

ROLLING STOCK PURCHASES BUSINESS ANNOUNCEMENTS

Miners Plan Partial Truce

Buyers of Coal Are Awaiting Developments of the Cleveland Conference and as a Result Orders for Coal Have Eased Off Slightly—Priority Orders Are Few and the Car Supply Remains Short

The pinch of coal shortage is becoming severe in several portions of the country. Spokesmen for the fuel distributor stated this week that great pressure is being brought from the New England states and by states in the Northwest and in the Middle West.

Secretary Hoover stated that failure to observe the price maximum applied only to an insignificant portion of the tonnage being produced. No increases have been allowed in the maximum price, he stated, in those districts where the 1920 wage scale has been put into effect. He emphasized that the price agreement is for the period of the strike only, but he said the settlement of the strike will not necessarily take the lid off of prices.

The conference of bituminous operators and miners called by John L. Lewis of the United Mine Workers at Cleveland, Ohio, Monday adjourned its sessions daily. Operators not present were thus to be given time to reach the conference, it was stated. The real reason for the adjournment, however, it is generally understood, was to take under consideration the Crews-Glasgow plan for settlement of the strike. The original meeting—the attempted Four-State conference—was held in abeyance to see what would happen to the proposed Crews-Glasgow scheme. The plan now is that if the operators not present still hold aloof to try and form an agreement among those taking part in conference. A committee was appointed Friday to draft a new wage scale and agreement.

SLIGHT DECREASE IN COAL DEMAND

Demands for coal have eased off a trifle in the past week. There is, of course, no dearth of orders for all the coal that is being mined, but there has come an abatement in the rush as buyers prefer to await developments of the Cleveland conference. The cessation of feverish buying has been accompanied in some instances by curtailed industry activity and further efforts toward fuel conservation by utilities and carriers. In some sections the shortage is now acute; this is responsible for many Lake vessels tying up because of no bunkers and shortened operating schedules at steel mills in the Youngstown district.

Railroads are functioning better, production has increased slightly, and while congestion of loads is still the main bar to heavier non-union production, the accumulated tonnage on wheels is slowly being untangled and sent to destination.

Coal Age Index of spot bituminous prices dropped 45 points to 511 on Aug. 7. This corresponds to an average mine price of $6.18, as compared with $6.73 on July 31. Buyers who must have coal are paying gilt-edged prices for it, unless they are fortunate enough to be lined up with connections who are using the Hoover price as a basis of sale. The list of operators in this category is growing rapidly, however, and in the Midwest the Hoover level may be considered the minimum price of today, with the range continually narrowing as less and less coal moves at the high prices of last week. No seller wants to have high-priced coal confiscated at the Hoover level and there is also a growing feeling among producers that the wisest policy is to accept a reasonable return, especially as the car supply is to be contingent upon the observance of fair prices.

Contrary to expectations, priority orders have not swamped the mines now operating nor has the car supply improved materially, even for those producers who had accepted such preferential business.

The feeling that a resumption of union mining is impending is reflected in this week's market for British coal in this country. Heavy orders had been placed in Great Britain for consumers in New England and the Atlantic seaboard but cancellation of some of these orders, amounting to many thousands of tons, followed the events of the week in the coal trade. As delivery of British fuel involves several weeks' time. no consumer wants to have much of this tonnage enroute or on unfilled orders when there is a prospect of home-mined coal being available in the near future.

Coal Shortage Felt at Steel Mills

The fuel stringency has become much more pronounced at iron and steel works, according to a review of conditions in this week's *Iron Age*. In the Chicago, Cleveland, Youngstown, Pittsburgh and Buffalo districts a dozen more blast furnaces have been forced to suspend. As many more are likely to be thrown idle by another week, and indications are that in two weeks several steel plants will be forced to stop.

It is plainly indicated that for a good many weeks but a small percentage of newly mined coal will go into the production of iron and steel. There is no excitement among consumers, and little of the scramble for material that is often seen in time of scarcity.

July output of steel ingots showed an expected decrease from June, but it was not large. The estimated daily rate for the country was 113,700 tons, as compared with 115,800 tons in June and 114,700 tons in May. August will show a pronounced falling off.

Bids Received for Station Work and Yard Track

The New York Transit Commission has received bids to cover the changes required in the steel work at the east end of the Bridge Plaza station, Long Island City, to make possible service by the Brooklyn Rapid Transit Company beyond the plaza station, at which Brooklyn Rapid Transit trains operating in the Broadway subway, Manhattan, now terminate.

The commission also received eight bids for an additional approach track for the Lenox Avenue branch of the Lexington Avenue subway into the Interborough yards at Lenox Avenue and 147th Street. This contract will require the construction of a few hundred feet of subway and an open cut.

Food Prices Increase

The U. S. Department of Labor, through the Bureau of Labor Statistics, has issued compilations showing changes in the retail cost of food in twenty-four representative cities.

During the month from June 15, 1922 to July 15, 1922, fifteen of the twenty-four cities increased as follows: Manchester and Portland, Me., 4 per cent; Bridgeport and New Haven, 3 per cent; Chicago, Denver, Fall River and Milwaukee, 2 per cent; Atlanta, Baltimore, Columbus, Houston, Jacksonville, and Salt Lake City, 1 per cent. In Pittsburgh there was an increase of less than five-tenths of 1 per cent. The other nine cities decreased as follows: Philadelphia and Richmond, 2 per cent; Cincinnati, Detroit and Kansas City, 1 per cent; Little Rock, New York, Scranton and Washington, D. C., showed a decrease of less than five-tenths of 1 per cent.

Metal, Coal and Material Prices

Metals—New York	Aug. 8, 1922
Copper, electrolytic, cents per lb.	14.00
Copper wire base, cents per lb.	15.625
Lead, cents per lb.	5.77
Zinc, cents per lb.	6.57
Tin, Straits, cents per lb.	32.50
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$8.875
Somerset mine run, Boston, net tons	6.875
Pittsburgh, mine run, Pittsburgh, net tons	....
Franklin, Ill., screenings, Chicago, net tons	...
Central, Ill., screenings, Chicago, net tons	....
Kansas screenings, Kansas City, net tons	4.875
Materials	
Rubber-covered wire, N. Y., cents per lb.	6.05
Weatherproof wire base, N. Y., cents per lb.	16.00
Cement, Chicago net prices, without bags	$2.05
Linseed oil, (5-bbl. lots), N. Y., cents per gal.	91.50
White lead, (100-lb. keg), N. Y., cents per lb.	12.50
Turpentine (bbl. lots), N.Y., per gal.	$1.16

Rolling Stock

Chicago (Ill.) Elevated Railroads has ordered 100 motor cars from the Cincinnati Car Company. Baldwin trucks will be used. As stated in these columns in the May 13 issue, these cars will be similar to cars already in service but particular attention will be given to provide increased comfort to passengers.

Chicago, Aurora & Elgin Railroad, Aurora, Ill., has placed an order with the Pullman Company for nineteen steel passenger cars and one dining car.

Great Northern Railway, St. Paul, Minn., has purchased four rail motor buses to be used in short line service.

Muskegon Traction & Lighting Company, Muskegon, Mich., recently spent $12,000 in new motors for its cars. The company is considering the purchase of double-truck cars for winter use. No definite decision, however, has been reached in this regard.

Southern Indiana Gas & Electric Company, Evansville, Ind., has bought four new safety one-man cars to take the places of the ones destroyed when the car houses of the company burned several weeks ago. The company is also building five double truck cars.

Hull (Que.) Electric Company has added two one-man safety cars to its rolling stock equipment. The cars are 21 ft. long, 8 ft. 1¼ in. wide and seat forty-one persons. The car bodies are of semi-convertible type with wooden sides and were built by the Ottawa Car Manufacturing Company.

New Orleans Railway & Light Company, New Orleans, La., will purchase the 100 new cars following authorization by Judge Rufus Foster of the United States District Court for the eastern district of Louisiana. The bids of the J. G. Brill Company, Philadelphia, Pa., for seventy-five cars and that of the Perley A. Thomas Car Works, of High Point, N. C., for twenty-five cars, were approved by the court. The cost of the equipment is estimated at $1,186,755. The order of the court authorizing the purchase makes the purchaser of the railway system, at the coming public auction on Aug. 17, assume the contract of paying for the equipment.

Power Houses, Shops and Buildings

American Water Works & Electric Company, New York, N. Y., is considering extensions to its power system to take care of the rapidly developing business of the company. The improvements will approximate $1,000,000.

Ohio Service Company, Coshocton, Ohio, has purchased the plant, equipment and lines of the Sugar Creek Light & Power Company, supplying current to Walnut Creek, Sugarcreek, Shanesville and Baltic. The plant will be connected with the Ohio Service Company's line in Dover on Aug. 1. The Ohio Service Company has an option on the plant, equipment and lines of the Zoar Battery Company at Zoar, which supplies Zoar, Bolivar and Mineral City with light and power.

New Orleans Railway & Light Company, New Orleans, La., is contemplating among the improvements in the immediate future, involving an outlay of nearly $750,000, the erection of two additional substations in New Orleans. The Bourbon Street substation is to be rebuilt and equipped with a 2,000-kw. motor generator and furnished with additional 233 volt d.c. feeders for the Edison system and two a.c. 6,600 volt feeders are to be transferred from the Central station. The other substation will be erected on Dryades Street. Dwight P. Robinson & Company, Inc., New York, will have charge of the new work. They are now installing the new turbine at Market Street.

New Incorporations

Dixie Traction Company, Beechwood, Ky., has filed articles of incorporation with a capital stock of $10,000. William T. Russell of Cincinnati and men from Covington are the incorporators.

Trade Notes

Scheld Engineering Corporation, New York, N. Y., has been appointed metropolitan and export representative for the Franklin Moore Company, Winsted, Conn., manufacturer of material handling machinery.

Conveyors Corporation of America, Chicago, Ill., announces that Monroe L. Patzig of Des Moines, Ia., has been appointed representative for the sale of its American trolley carrier in central Iowa.

The Dayton (Ohio) Mechanical Tie Company reports that the Gary Street Railway has just ordered a large number of Dayton Resilient ties for further improvements of tracks in Gary, Ind. This is the third order placed since the initial installation of this type of tie.

Charles P. Steinmetz, chief consulting engineer of the General Electric Company, Schenectady, has been nominated for State Engineer and Surveyor of New York by the Socialists. The platform of the Socialists declares for public ownership and operation of all public utilities. It condemns the New York Transit Commission for alleged favoritism.

Perey Manufacturing Company, New York, N. Y., announces that it has received the contract for equipping the Frankford elevated line with forty-seven of its standard type passimeters, and in addition the Philadelphia Rapid Transit Company has purchased twenty-eight of this type for installation at points on their system where changes were necessary through putting the Frankford Elevated Railway into operation.

Florandin Equipment Company, New York, N. Y., has been organized by C. H. Florandin with offices at 110 West Fortieth Street, New York, to act as representative of the Conveyors Corporation of America, Chicago, manufacturer of the American steam jet ash conveyor and the American trolley carrier. The new organization will also do a general contracting business in and around boiler rooms and industrial plants located in New York and its vicinity, erecting and installing the lines of equipment which the organization handles. Mr. Florandin has had wide experience in this work, for several years being eastern manager of the Conveyors Corporation before forming his own company.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., announces a number of changes in personnel. R. B. Mildon has been appointed general manager of the stoker department, with headquarters at South Philadelphia. G. A. Sacchi, formerly manager of the stoker section, has been appointed manager of stoker sales and will have his headquarters at South Philadelphia. Edgar Woodrow has been appointed manager of the contract division of the stoker department. F. G. Hickling is now manager of the railway division of the Pittsburgh district office. Norman Stewart is branch manager of the Minneapolis office. S. R. Shave has been appointed manager of the price section of the power and railway departments, East Pittsburgh. M. C. Rypinski of the radio sales division has transferred his headquarters to New York as a branch of the headquarters sales department. A. Heckman is now works electrical engineer for the East Pittsburgh works of the company.

New Advertising Literature

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has just published leaflet No. 3,428, describing the advantages of rolling contact for control apparatus.

Irving Iron Works, Long Island City, N. Y., has issued an eight-page bulletin, describing the construction of their subway grating. A table of safe loads for the various types used is included.

Armstrong Cork & Insulation Company, Pittsburgh, Pa., has recently issued a booklet entitled "A Neglected Source of Economy," which deals with the savings that can be effected in manufacturing plants by the use of refrigerated drinking water systems. A copy of the folder will be sent free of charge to those who ask for it.

The Hardwood Manufacturers' Institute, Memphis, Tenn., has issued a pamphlet entitled "The Hardwood Manufacturers' Institute." This contains reprints of several addresses and resolutions introduced at a recent meeting of the Institute. The pamphlet also contains information as to its purposes and policies.

What Kind of Automatic Substation Overload Protection?

WHEN the question of putting in automatic control comes up for discussion between the manager and the electrical engineer, the former is likely to put his foot down pretty hard on some particular feature which he thinks should govern. For example, he may say that service must be uninterrupted regardless of everything else and the substation must look out for itself. Or he may be more solicitous for the machinery, saying that a slight interruption to service cuts no figure, but valuable substation apparatus must not be jeopardized. There is still another aspect which may interest him, namely, the way in which the station will behave with respect to distribution of load and to voltage fluctuation. The substation must not, through the opening and closing of its mysterious relays, unduly interfere with the line voltage by shifting loads promiscuously. Of course, there is also, and usually, the matter of cost to be considered in connection with each plan.

Given the requirements, it is up to the electrical engineer to analyze his own problem with consummate skill. For this purpose he has not heretofore had much more than descriptive literature available. But thanks to the symposium on the use of resistance as a factor in insuring good service from automatically-controlled substations, printed in the June 24 issue of this paper, and the contributions to the discussion in the issues of Aug. 5 and Aug. 12, his need for specific technical information has at least in part been met.

This paper has no hard-and-fast rules to suggest as guides in automatic substation design. The subject is too varied for that. All that can be hoped in this direction is that such information as is given in these contributions on the subject will be carefully assimilated and applied.

The Coal Industry "Should Worry" About the Public

ON LAST April 1 there was surplus coal and the price, therefore, threatened to go down to the point that the existing rate of wages could not be paid. The miners would not accept less. The strike, prolonged through four and one-half months, created such a shortage and consequent demand that high coal prices are assured throughout the winter. So the operators quickly agree to the old wage scale, the check-off system, no arbitration, etc., and sign a contract extending to next April 1. The deadlock is broken, but the public and all industry must pay the bills.

A pretty cycle. It solves the problem for the operators. The miners preserve their high wage scale. But where do the public and business get off? What slightest assurance is there that the same cycle will not be repeated next year? The committee that is to be created will have no authority. It can only recommend and the outcome of its work is not promising. The immediate interests of the miners and operators are served by the settlement, and there is not likely to be a coal famine this winter. Beyond this, no accomplishment is in evidence. The operators can certainly take no pride in being party to such an unconstructive settlement. For the problem is before the country just as seriously as before and the permanent solution is only postponed.

The Public Must Protect Itself

CONGRESS will be derelict in its duty if, during the coming session, it does not in some way limit the present power of railroad employees to stop interstate transportation by striking. Congress has plenty of power as well as precedent for action of this kind. The Erdman act and the Newlands act differentiated labor engaged in transportation from that in other undertakings, and the vital concern of the public in the settlement of railroad problems is again emphasized in the present railroad act. The purpose of this act was to secure the development and continuity of service of the interstate railroads of the country, and if the law did not go far enough, its scope should be increased. In the present state of the public mind the railroad and coal situation stand paramount and far exceeding in importance as issues the tariff or the bonus to which Congress has given a great deal of time during the past eight months.

The most serious aspect of the present trouble was the abandonment of work by train operators on several roads because of the presence of guards or because of alleged defective equipment. The first reason is a direct challenge to the power and duty of the constituted authorities to keep order. A concerted attempt to prevent either the states or the national government by intimidation from protecting private property and otherwise carrying out the law is a far greater assault against our present system of government than to abandon work because of dissatisfaction with wages and working conditions. If the railroad union heads are to have a veto on the movements of the police, the militia or other guards authorized by law, they might just as well take the title of commanders-in-chief, which by the constitution belongs to the President. As to the excuse of defective equipment, this will strike most observers as a subterfuge only, when unsupported by evidence.

Admittedly it will be difficult to draft an entirely satisfactory national law to cover the situation because of the great freedom with which men have been able to stop work. It has been said, also, that any such plan is equivalent to involuntary servitude and contrary to our ideals. Nevertheless, some way must be found to make the welfare of the whole people, which is paramount to the desires of any group or class, free from the caprice of that group. When a man accepts a job with a public service industry, he must accept a restriction on the right to a collective strike. If he is unwilling to submit to this he should get a job in another industry in which the public welfare is not the controlling consideration. At the same time wages in these industries should always be adequate to attract good men.

There are precedents for limiting the freedom of action of labor engaged in certain industries on which the public is dependent. The Kansas Industrial Act is one precedent and the Industrial Disputes Act of Canada is another. The reason there are not more precedents is that up to recently there has been no great need for any. Now, however, it is within the power of a few people to stop a vital utility service such as railroad transportation and the mining of coal, and they have repeatedly shown a readiness to use this power to serve their own ends. The public must protect itself against repetitions of the present situation whether or not a truce to settle the existing strikes is arranged.

European Tramways Have Also Had Their Financial Troubles

REPORTS from abroad prove that the tramways in European countries have passed through a cycle not greatly different in kind from that here, but the changes in most cases have been even more marked because the depreciation in the purchasing power of currency has been greater. It is not surprising that this situation should be found because tramway conditions are largely the same everywhere, and there is melancholy satisfaction in realizing that American fare experiences have not been unique. Briefly the situation has been on both sides of the Atlantic that wages and the cost of materials rapidly increased, there was great difficulty in securing an increase in fare from the authorities, and when this increase came, traffic fell off, as a rule. In Great Britain the difficulties appear to have been somewhat less in degree than elsewhere in Europe, due perhaps to less depreciation of the currency, to greater ease in getting fares because most of the larger properties are municipally owned and to the great industrial activity of the larger towns during the war in the manufacture of munitions.

The interest of American managers in the situation centers particularly on the solutions adopted. That in Paris was described at length in the issue of Aug. 5. Briefly, the city purchased the property and leased its operation to a private company on a sort of service-at-cost plan, but as yet it has been impossible for the leasing company to operate the system at the fares charged without a good-sized deficit, and this deficit is being made up out of the municipal funds Up to the financial crisis brought about by the World War, the Paris tramways were operated by seven private companies. In Berlin the city has taken over the tramway system and in this case is operating the cars directly, municipalization taking place in 1920. Here the effort required to raise the fare as rapidly as the mark depreciated naturally has been great, and tickets issued by the tramways department had to carry a statement that they would no longer be good for a ride when retired by public announcement. In the countries of even greater currency depreciation, as Austria, the rapidity and extent of fare increases have been even greater.

It is instructive to note that in spite of all these vicissitudes, in no country has the belief been held that because of these conditions electric railways are obsolete. As with every other going concern, there are expenses of operation and these have to be met by charges for the services rendered, supplemented in some cases by subsidy. But every one realizes that the electric cars have still to be kept running, even in the countries where the currency has fallen to almost minute values.

Electric Railways Can Use National Safety Council Service

THE coming eleventh annual safety congress promises to be unusually effective from the standpoint of the electric railways. The program contains the names of three of their presidents, Arthur W. Brady, Frank R. Coates and Britton I. Budd, and there are others well known in the general safety department of the electric railway field. The participation of these men in the congress insures its value to all who really desire to mitigate the accident menace.

The National Safety Council has not been taken as seriously among electric railways as in the manufacturing industries, yet if the organization is what it should be, it ought to command the support of one as much as the other. Surely the annual costs of accidents on most properties is sufficient to cause grave concern and every available means to reduce them should be utilized.

If the National Safety Council as at present conducted does not suit electric railway managers, they can improve it from the inside if the leaders among them will take hold. The council is a going concern; it is a truly national affair; it possesses possibilities of helpfulness if only through its function of acting as a clearing house for safety information.

What's the Matter with the Company Sections?

THE company sections of the American Electric Railway Association seem not to be as active as they formerly were. Have the sections lost their vitality, or have conditions in the industry so changed that they are no longer desirable or necessary? This is a pertinent question, because the electric railway industry has passed through a period of strenuous trial, and while it is now on the upgrade it needs to utilize every agency that can help to bring it back to its normal status. Is the company section one such agency, and if it is, why is not this agency being used more effectively?

There was a time during the war period when a slump in company section activities was to be expected. Such a slump occurred. But it is now nearly four years since the armistice was declared. This seems long enough to allow the sections to get back into form. Why have they not done so?

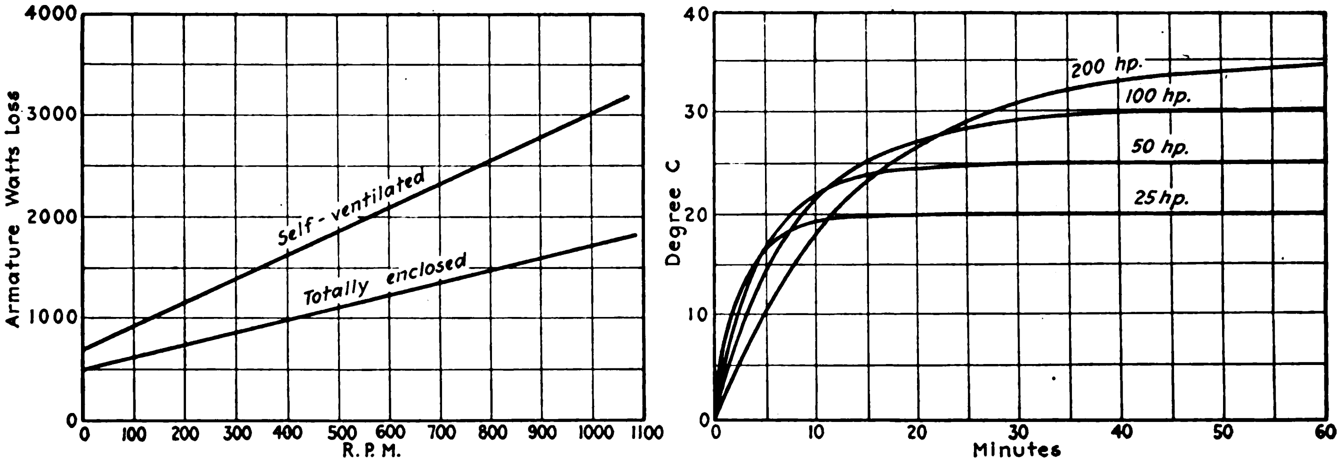
There is a real need for company sections of the American Association or their equivalent. There is an advantage in having the stimulus due to membership in a national organization. But there is no magic about a company section that will cause it to operate itself. Motive power is needed locally, and this means conviction on the part of a few energetic spirits that the proposition is worth while. Probably the present state of suspended animation is due to the fact that the hustlers in most of the sections are hustling in connection with some other activities, which for the time they consider more important.

Limiting Temperatures of Railway Motors

The Performance of Railway Motors as Limited by Temperature of the Windings—The Relation of Motor Load to Internal Temperatures and Methods of Measuring Temperatures Are Discussed

By G. E. Luke
Motor Engineering Department, Westinghouse Electric & Manufacturing Company

THE characteristics of an electric motor are such that it will try to carry any load which is put upon it, regardless of the magnitude of the load. Thus in the hands of unskilled operators it is easily possible to abuse a motor by requiring it to perform excessive overloads. This condition is especially possible in railway service, where all conditions of loads are found, such as operating with one-half of the motors cut out, pulling in disabled cars, bucking snow, operating with tight brakes and many other possibilities. The existence of overloads is indicated by repeated "blowing" of the circuit breaker, flashing of the motors and slipping of the wheels. A motor may be overloaded, however, without any of the above indications. The real criterion of overloading is the maximum internal motor temperature. The result of excessive temperatures is to deteriorate the insulation; failure is not instantaneous; on the contrary, the motor may not fail until weeks or months afterward.



At Left—Graphs for a 65-Hp. Railway Motor Showing Relation of Watts Loss Dissipated from Armature on Continuous Duty to the R.P.M. on Basis of a 65-Deg. C. Rise by Thermometer. At Right—Approximate "Hottest Spot" Correction Factor at Nominal Rating for Various Sizes of Motors

The purpose of this article is to discuss, briefly, insulation life as influenced by temperatures, the relation of motor load to the internal temperatures and the method of measuring these temperatures.

The insulation used on railway motor windings is composed of many materials. From the temperature standpoint they are divided into two classes, A and B. Class A insulation is composed of specially treated or impregnated cotton, linen, paper and similar materials. This type of insulation is generally found in the light traction railway motors in which wire wound armature coils are used. This insulation deteriorates in strength with age even at room temperatures; high temperatures act to accelerate the deterioration. A temperature of 105 deg. C. is given in the standardization rules of the A. I. E. E. as the maximum temperature which this class of insulation can stand continuously without endangering the life of the motor. In order to reduce weight to a minimum it is considered good engineering to run railway motors at higher temperatures than are found on stationary machines. Experience has shown that class A insulation exposed to actual temperatures ranging from 115 to 125 deg. C. will give a motor life satisfactory for railway service.

Proper impregnation of windings will greatly improve this insulation. The varnishes or gums tend to keep moisture out of the windings and to prevent oxidization or burning of the insulation under high temperatures.

Insulation life as affected by temperatures is also a function of time. Class A insulation for short periods may be exposed to temperatures much higher than the values previously given. For example, tests on a small railway motor at loads ranging from 150 to 300 per cent normal rating for time periods of five to thirty minutes gave maximum internal temperatures varying from 150 to 200 deg. C. On three of these runs the armature insulation varnish started to "smoke" (the actual temperatures recorded ranged from 175 to 200 deg. C.). After these special tests the coils were torn apart and the insulation was found to be in good condition. Neither the cotton tape nor the treated cloth showed signs of failure either mechanically or electrically. Such temperatures, however, if repeated would no doubt cause failure, especially after the varnishes and gums have been driven out of the windings.

Class B insulation is composed of mica, asbestos and other materials capable of resisting high temperatures in which class A material or binder is used for structural purposes only and may be destroyed without disqualifying the insulation for continuous service. This class of insulation is used on the majority of the heavy traction motors, especially those which have strap wound armature coils. This insulation will safely withstand temperatures of 150 deg. C. or more on continuous duty. In fact, with this type of insulation, the limitation to the maximum permissible temperature is quite often found not in the insulation but in the soldered connections. Ordinarily "half and half" solder melts at approximately 180 deg. C. By the use of a tin solder this melting point may be increased to 230 deg. C.

It is possible to have a coil insulated with both class A and class B insulation and still be equivalent to a class B insulated coil. This may be done, for example, in a strap wound field coil with asbestos insulation between the straps and several layers of mica or asbestos wrappers around the coil, these layers being held in place by a few layers of treated cloth and tape. In this coil the class B insulation is found where the maximum temperatures exist. The class A insulation, being on the outside of the coil, is exposed to temperatures considerably under the internal temperatures.

The temperatures previously referred to are the maximum internal temperatures or the so-called "hottest spot" and not the temperatures obtained with the usual thermometer method. On overloads the maximum temperatures are found on the copper and the insulation adjacent is exposed to this temperature. It is at this point where insulation failure first starts and not on the outside of the coil, where much lower temperatures may exist.

CONTINUOUS AND SHORT TIME RATINGS NECESSARY

Railway service requires a motor to be able to deliver an average load continuously and also to be able to carry heavy overloads for short time intervals without exceeding dangerous temperatures in the windings. In order to be able to apply the motors properly, this requirement necessitates a double rating. These ratings are the continuous and a short time rating.

On continuous duty all of the heat produced due to the motor losses must be carried away as fast as it is generated; that is, there is no stored energy. Starting with the imbedded armature, this loss is conducted from the copper principally to the iron core. To do this requires a temperature difference between the copper and the core, since the heat flow is across the insulation. Electrical insulation is also good heat insulation. For example, the average insulation has a resistance to the flow of heat of approximately 3,000 times that of copper; this means that if a loss of one watt is flowing through a piece of insulation 1 in. square and only $\frac{1}{16}$ in. thick the temperature drop will be about 20 deg. C. This drop is unaffected by ventilation and depends only upon the heat flow and the thickness of the insulation. This heat loss due to the copper loss is conducted to the iron core, where it then flows to the cooler portions of the iron, namely, the ventilating surfaces. The iron loss also takes this same path. The required temperature drop through the iron will be only a few degrees, due to its relatively good thermal conductivity. It requires a certain temperature drop at the ventilating surfaces in order to transmit the heat loss to the inside air. This temperature gradient between the surface and the average inside air temperature is a function of the relative velocities between the surface and the air and the watts per square inch of surface which must be dissipated.

With an inclosed motor, the average internal air temperature is high, since the armature loss which has been transferred to this air must now be transmitted to the frame, and this loss, together with the field loss, must all be dissipated from the external frame surfaces. Each portion of this heat path requires definite temperature drops. For winter operation in cold climates self-ventilated motors are usually provided with covers for totally inclosed operation. The fan on the armature under these conditions is effective in circulating the internal air and thus materially increases the rate of heat flow to and from the ventilating surfaces as well as equalizing the internal temperatures. The windage loss due to the fan in the average railway motor is small and does not exceed 5 per cent of the total losses at the average operating speed. This loss is more than compensated for by the fact that the increased windage inside of the motor, according to tests on a 50-hp. motor at the continuous rating, decreased the internal temperatures 13 per cent, which shows the importance of proper internal ventilation even on inclosed machines.

On the other hand, with a self-ventilated motor in which a definite quantity of air is pulled through the motor, the internal air temperatures are much lower and the surface velocities relative to the air are also higher. Both of these conditions give the ventilated motor a greater continuous rating than the inclosed motor of the same size.

The benefit to be gained by self-ventilation is roughly proportional to the fan's peripheral speed. This is shown in the graphs giving the relation of watts loss dissipated from the armature and the armature speed for a constant temperature rise under two different conditions of ventilation.

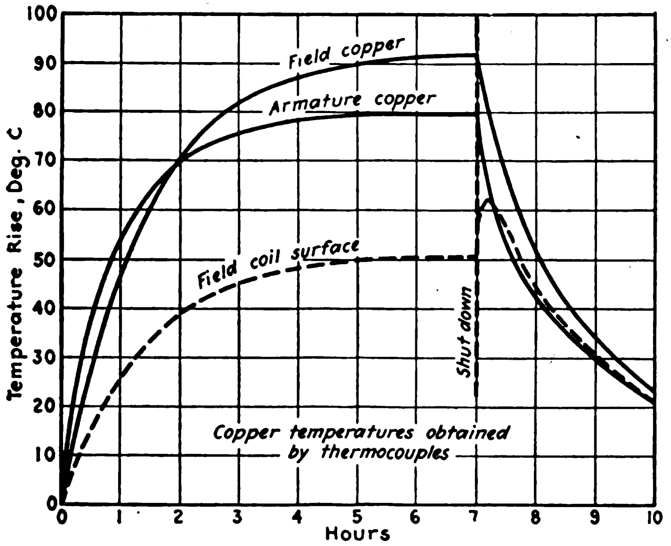
It is unfortunately the characteristic of series motors, however, that high motor losses which accompany high loads also result in low armature speeds and hence decreased ventilation. This disadvantage can of course be overcome with the use of a separate constant speed external blower. This is an added complication, however, and is done only when necessary. Such conditions are often found in heavy traction service.

The continuous rating of a motor is greater in service than on the test floor. This is due to the increased ventilation on the external frame resulting from the car movement. This is especially pronounced with an inclosed motor, where all of the heat loss must be liberated from the frame. In such cases an average speed of 10 m.p.h. will result in temperatures 15 to 20 per cent lower than those found on the test floor. With self-ventilated motors the heat dissipated from the frame ranges from 25 to 65 per cent of the total loss, depending upon the motor speed at the continuous rating. Thus with this type of motor the temperatures will be reduced approximately 5 to 15 per cent with a car speed of 10 m.p.h. compared to the temperatures obtained on the test floor.

The load carried by a motor in service is anything but a continuous load. For this reason a short time rating is used, namely, the nominal or the one-hour rating. The purpose of this rating is to give an indication of the motor's short time or thermal capacity, since with such loads the heat losses cannot all be liberated as fast as generated; in other words, part of the losses must be stored up in the motor copper and iron. The storage of the heat is of course accompanied by an elevation of the motor temperature.

At the nominal rating the losses of the motor which take the form of heat are partly liberated from the frame by radiation and convection (principally the latter), a part is carried away by air currents passing through the motor, and the remainder must be absorbed by the motor parts. On a slow speed motor where the ventilation is relatively small as much as 85 per cent of the losses may be absorbed, the remaining 15 per cent being accounted for by heat loss from the frame and air through the motor. On the other hand, with a well-ventilated high-speed motor it is possible to find 10 per cent of the loss dissipated from the frame, 30 per cent carried away by the ventilating air, with the remaining 60 per cent absorbed. This shows that the one-hour rating is not a true indication of the motor's heat storage capacity, since the percentage of heat loss stored in the motor during this run is a function of the motor's ventilation.

The real limitation to the short-time rating is due to the fact that the heat losses are not uniformly distributed throughout the motor but are concentrated in the copper windings, which have relatively little weight and are well heat insulated from the heavier iron masses. This is especially true of the armature windings, since the current density in these are generally greater than in the field windings. A loss of 5 watts per pound of copper will raise its temperature 100 deg. C. in one hour if all is absorbed. However, at the nominal rating the armature loss ranges from 15 to 50 watts per pound of armature copper, the latter figure being found in the smaller motors. Thus, the percentage of armature copper loss at the nominal rating, which must be transferred through the insulation to the iron or air, ranges from 66 to 90 per cent. This requires the internal copper temperature to be greater than the iron core temperature, and if it is desired to estimate these internal temperatures from the iron temperature by thermometer the conventional "hottest spot" correction factor must be added. This factor is a function of the heat density flowing through the insulation, the thickness of insulation and condition of load, whether continuous or short time. The approximate value of this correction or internal temperature drop is shown in the accompanying graphs, for various sizes of motors at the nominal rating. At other loads this factor will vary approximately as the square of the current. This shows clearly the small thermal capacity of the armature copper on the smaller motors.

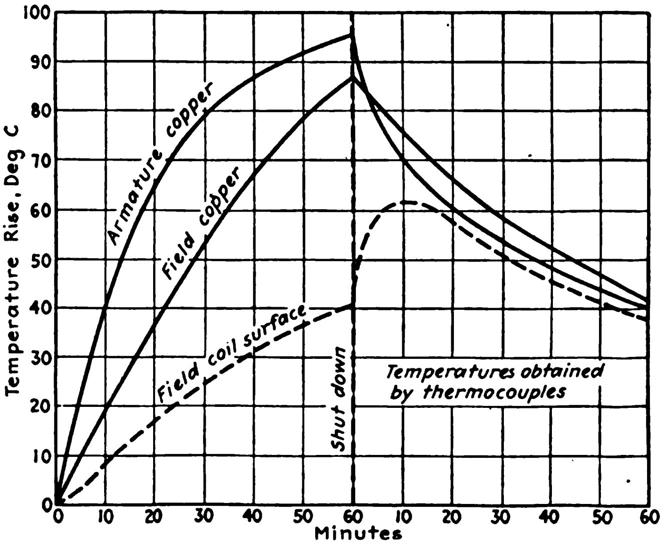


APPROXIMATE HEATING AND COOLING GRAPHS OF A 50-HP. RAILWAY MOTOR SELF-VENTILATED AT CONTINUOUS RATING

For overloads equal to twice the one-hour rating the maximum rate of rise of the armature copper above the iron will be 9.6 deg. C. per minute for the 200-hp. motor and 28.0 deg. C. per minute for the 25-hp. motor.

On the test floor it is now possible to obtain the temperatures of any part of the motor with the use of temperature detectors such as thermocouples. The standard thermocouple for this work is the copper-advance couple. A welded or soldered junction of these two metals produces a voltage nearly proportional to the temperature of the junction. This voltage should be read with a potentiometer, which, for convenience, may be calibrated in degrees centigrade instead of millivolts.

These same thermocouples may be built into the motor windings with the junction placed at any desired point. On the stationary parts, such as field windings, the voltage produced by the hot junction, and consequently the temperature at that point, may be read while running. On the armature, however, it requires slip rings and brushes in order to be able to read the temperature of the thermocouple junction while running. On account of the difficulties involved, this is not usually done, but the thermocouples in the rotating part are read after shutdown. This can be accomplished, for example, by allowing the ends of the thermocouple leads to extend a short distance beyond the band wire for quick connection after shutdown. In this manner accurate data may be obtained as to the maximum internal motor temperatures and the heating and cooling characteristics of the motor under any load conditions. The average temperature of the windings may also be obtained on the test floor by the resistance method. These resistances in a series motor are low and can be read accurately with the use of a Kelvin double-bridge. These data are of great value to the application and designing engineers.

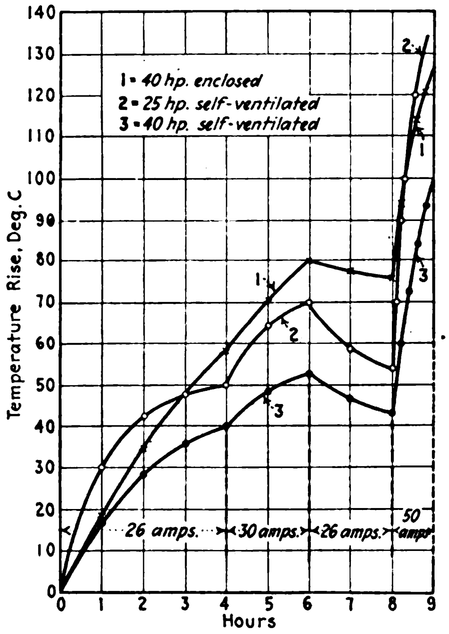


APPROXIMATE HEATING AND COOLING GRAPHS OF A 50-HP. SELF-VENTILATED RAILWAY MOTOR AT THE ONE-HOUR RATING

In service accurate motor temperatures are much more difficult to obtain. The easiest method and the one usually used is the thermometer method. This of course does not give the maximum internal temperatures nor is it usually possible to take a reading when the motor is the hottest.

The resistance method has been used in several cases. This can be applied to the field windings. With the current and voltage drop accurately known the resistance and consequently the average temperature of the windings may be determined. This method requires accurate and practically instantaneous reading of the voltmeter and ammeter for consistent results. A more satisfactory method is obtained by the use of thermocouples. With these the motor temperatures of the stationary parts may be obtained with the car in motion and in this way the maximum temperature may be found. (See article on "Determination of Train Make Up" by G. C. Bishop in ELECTRIC RAILWAY JOURNAL for Jan. 21, 1922.)

The heating curve of a 50-hp. self-ventilated railway motor at the continuous rating is given in an accompanying illustration. The solid lines are the maximum copper temperature rise of the field and armature windings as obtained with thermocouples. The rise by resistance was lower than these values. The dotted curves give the surface temperature rise of the field coils as obtained by either thermocouple or thermometer placed on outside of the coil. It should be noted that after shutdown the surface temperatures, as measured by thermometers, rise to a maximum value and then begin to fall. This rise is due to the decreased ventilation after shutdown. The difference between the field copper and the field coil surface rise is the temperature drop through the insulation. After shutdown the copper temperatures drop rapidly. The armature copper temperature falls quicker than the field. Conversely, the heating curve shows a steeper armature copper rise than that found on the field copper.



APPROXIMATE HEATING GRAPHS OF THREE RAILWAY MOTORS—MAXIMUM COPPER TEMPERATURE

This rapid change in temperature brings out clearly the difficulty encountered in obtaining the motor temperatures, especially in service where considerable time may be lost before temperature readings are obtained. At the one-hour rating the heating curves show the relative heating of the armature and field copper on short-time loads and why the armature is apt to be "roasted" if the motor is subjected to short-time overloads greater than the nominal rating.

The older types of railway motors were usually of the slow speed, non-ventilated type. These motors had large short-time capacity and relatively small continuous capacity. The modern demand for lighter and cheaper motors resulted in the development of the present line of self-ventilated motors. Since the ventilation is proportional to the armature speed greater gains in the continuous ratings could be made by going to these higher speeds. However, all railway service is subject to overload conditions which require heavy short-time capacity, and this can be obtained only by sufficient iron and copper masses for absorbing the surplus losses. This limitation restricts the degree of ventilation economically possible for this service. In order to bring out this point more clearly, the heating curves of three motors running over the same cycle are given. The ratings and weights of the three motors are:

Number	1-Hour Hp.	Rating, R.p.m.	Cont. Rating, Amp.	Weight, Lb.	Ventilation
1	40	700	26.0	1,900	Inclosed
2	25	1,200	32.0	1,000	Self-ventilated
3	40	700	38.0	1,900	Self-ventilated

The cycle consisted of the following:

(*a*) 4 hour run at a r.m.s. current of 26 amp.
(*b*) 2 hour run at a r.m.s. current of 30 amp.
(*c*) 2 hour run at a r.m.s. current of 26 amp.
(*d*) An overload run r.m.s. current of 50 amp.

The last portion of the cycle represents conditions which may be obtained by cutting out half of the motors on the car or in pulling in a disabled car, which practically doubles the motor's root-mean-square current.

In comparing the inclosed motor with the lighter self-ventilated motor it is seen that the heating curve of the ventilated motor is steeper. However, the limiting temperature on continuous duty will be much lower on the self-ventilated motor due to the internal ventilation. At the beginning of the last cycle the light ventilated motor is 22 deg. C. cooler than the inclosed motor. On the overload, however, since the temperature rise is practically determined by the watts loss per pound of copper and iron, the ventilated motor will necessarily have a steeper rate of rise. Thus, this overload can be carried for eighteen minutes by both the light ventilated motor and the heavier inclosed motor without exceeding a 100 deg. C. rise. If these two types of motors were called upon to deliver a heavy overload with both initially at the same temperature then the heavy inclosed motor would have a considerable margin over the lighter motor and would necessarily be able to carry the load longer. On the other hand, a self-ventilated motor of the same weight and characteristics as the inclosed motor will give a considerably lower temperature at the beginning of the overload and it will be able to run one hour at the 50-amp. load without exceeding the 100 deg. C. rise. In the example just cited the 1,000-lb. self-ventilated motor will do the same work as the 1,900-lb. inclosed motor providing the overloads are kept within reasonable values. Hence, in general, the saving in weight to be gained by using high-speed ventilated motors is determined by the heavy peak overloads and especially by those due to abuse or emergency conditions.

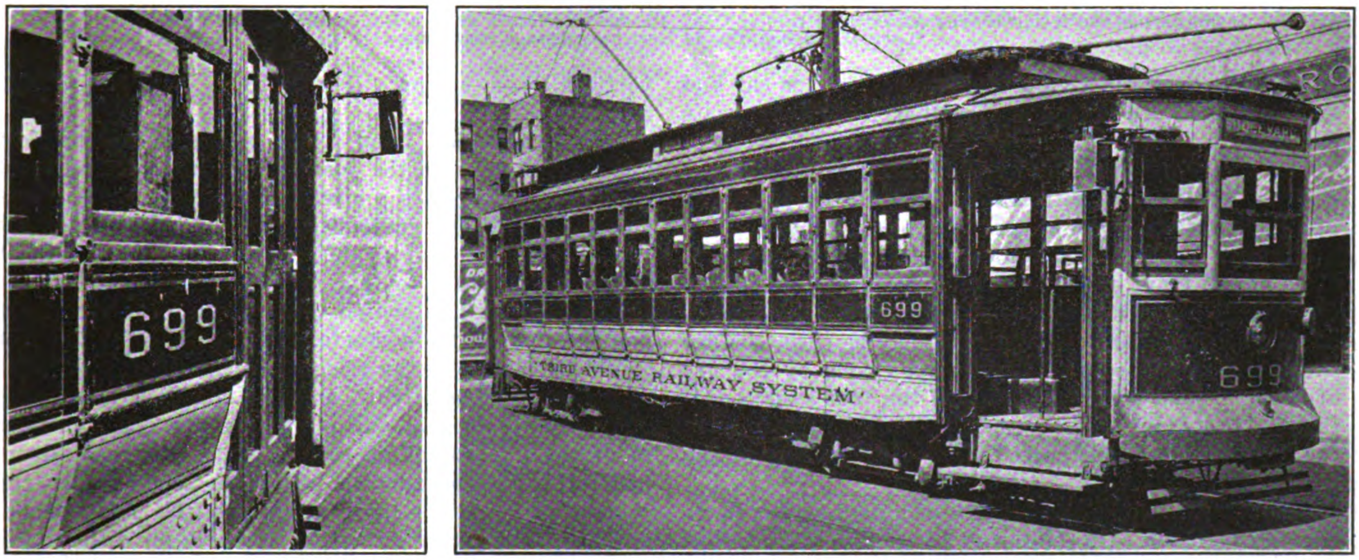
Airtight Door Developed

A NEW cast-iron door, 18 in. x 16 in. in size, has recently been developed by the Conveyors Corporation of America, Chicago, Ill. It is designed especially for boiler settings and is airtight. Floating hinges pivoted to door at the center insure an even pressure over the door when it is closed and locked. The door can be provided with either of two types of locks—with a wing nut at the end of a hinge bar or with a lever locking device, which is recommended when the door is subjected to frequent opening and closing.

Double-End Turnstile Car Tried in New York

Third Avenue Railway Has Remodeled One of Its Semi-Convertible Pay-as-You-Enter Cars and Installed Turnstiles and Other Automatic Equipment to Permit of One-Man Operation

THE Third Avenue Railway, New York, N. Y., has had one of its semi-convertible pay-as-you-enter cars equipped with turnstiles for double-end operation in trial service for the past two months. Many new features have been introduced in connection with the control, air brake and fare-handling equipment. The installation of the new equipment and the rearrangement of the apparatus on the platform and at the ends of the car were done in the shops of the company, under the supervision of J. S. McWhirter, superintendent of equipment, and many of the ideas and new equipment installed have never before been tried in electric railway service.

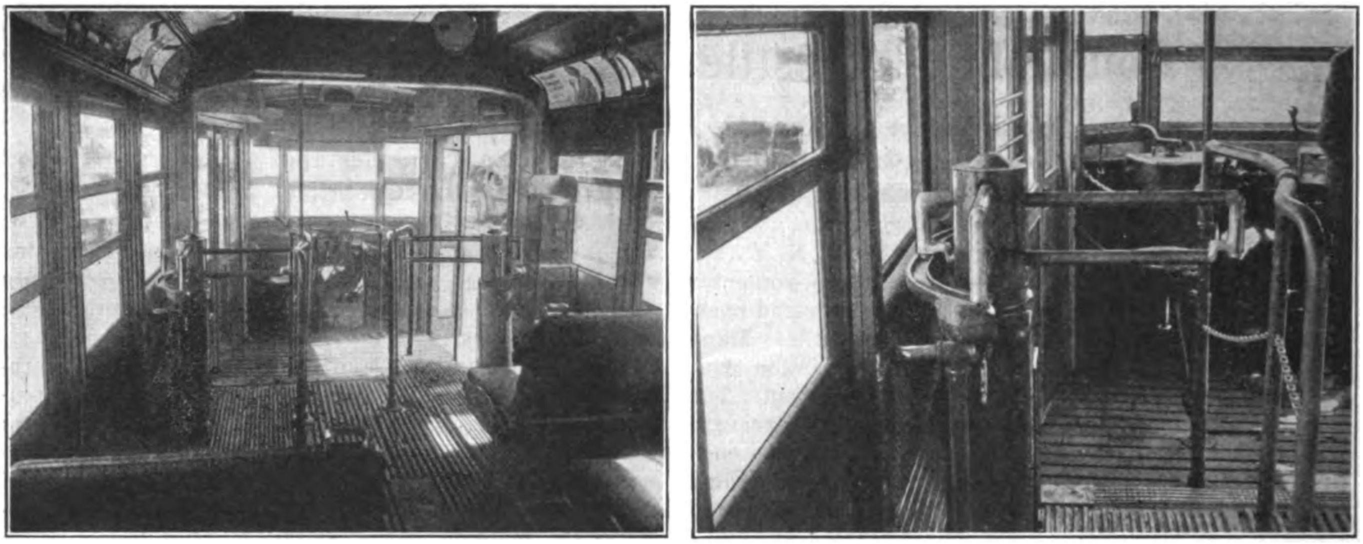


CAR AS RECONSTRUCTED FOR ONE-MAN OPERATION
At left—Folding mirror gives operator view of rear entrance. At right—Spacious front exit opening.

Car No. 699 is the particular one equipped and this is one of a lot of cars purchased from the J. G. Brill Company in 1909 and described in the *Electric Railway Journal* for Jan 23, 1909. The car is 30 ft. long over the corner posts and 43 ft. long over bumpers. As originally operated, there were seats for forty-four passengers inside the car body. In order to provide space for the installation of the turnstiles one cross-seat and two longitudinal seats were removed at each end of the car. Accompanying illustrations show the floor plans of the car before and after its rearrangement for one-man operation. As the car is arranged for double-end operation, four turnstiles are used, only two of which are necessary for operation in one direction. The car is operated on the pay-as-you-leave principle, the exit for all passengers being at the front end and entrance at the rear. The turnstile at the rear entrance acts only as a barrier to prevent people leaving by the rear door. The exit turnstile at the front end is released by the insertion of a 5-cent piece in a special type of fare box. The passenger can then pass out and the fare is automatically registered by the turnstile. Should a passenger wish change an additional exit opening is provided through the center so that he can receive his change from the operator and then deposit 5 cents in a Johnson fare box at the right of the operator, as the passenger leaves.

The turnstiles used are of the H. R. Langslow reciprocating arm type, handled by the Damon-Chapman Company, Rochester, N. Y. This type of turnstile is used in the stations of the New York, Westchester & Boston Railway and was described in the *Electric Railway Journal* for Oct. 1, 1910, and June 8, 1912. A particular advantage comes from the use of this type of turnstile in that the arms are made to slide through the center portion of the turnstile through the guidance of a cam. Much space is thus saved, as the turnstile can be set directly against the side of the car instead of occupying additional space for the rotation of the turnstile of ordinary types. Pipe railings are provided for guiding the passengers into and out of the cars. The tops of these railings extend slightly above the arms of the turnstile, and the bottom portion is closed in by the use of chains as required. The two turnstiles which are not in use with the car operating in one direction are also closed by the use of chains. The type of fare box used to unlock the turnstiles is of a type similar to that in use in the Interborough subways in New York in connection with their station turnstiles.

As the operation of the rear entrance door is controlled from the front end of the car, mirrors are installed at the right entrance to the operator. Clearance limitations are such that the mirrors must be folded in against the car while the car is in motion. The operation of these mirrors is interlocked with the door operation, so that the mirror swings out into position as either door is opened and folds in again after the last door closes. Mirrors are also installed inside the car above and to the right of the operator, so as



TURNSTILE AND RAILING ARRANGEMENT AT END OF CAR. PASSENGERS LEAVE BY THE RIGHT AND CENTER OPENINGS. LEFT HAND OPENING IS USED FOR REAR ENTRANCE

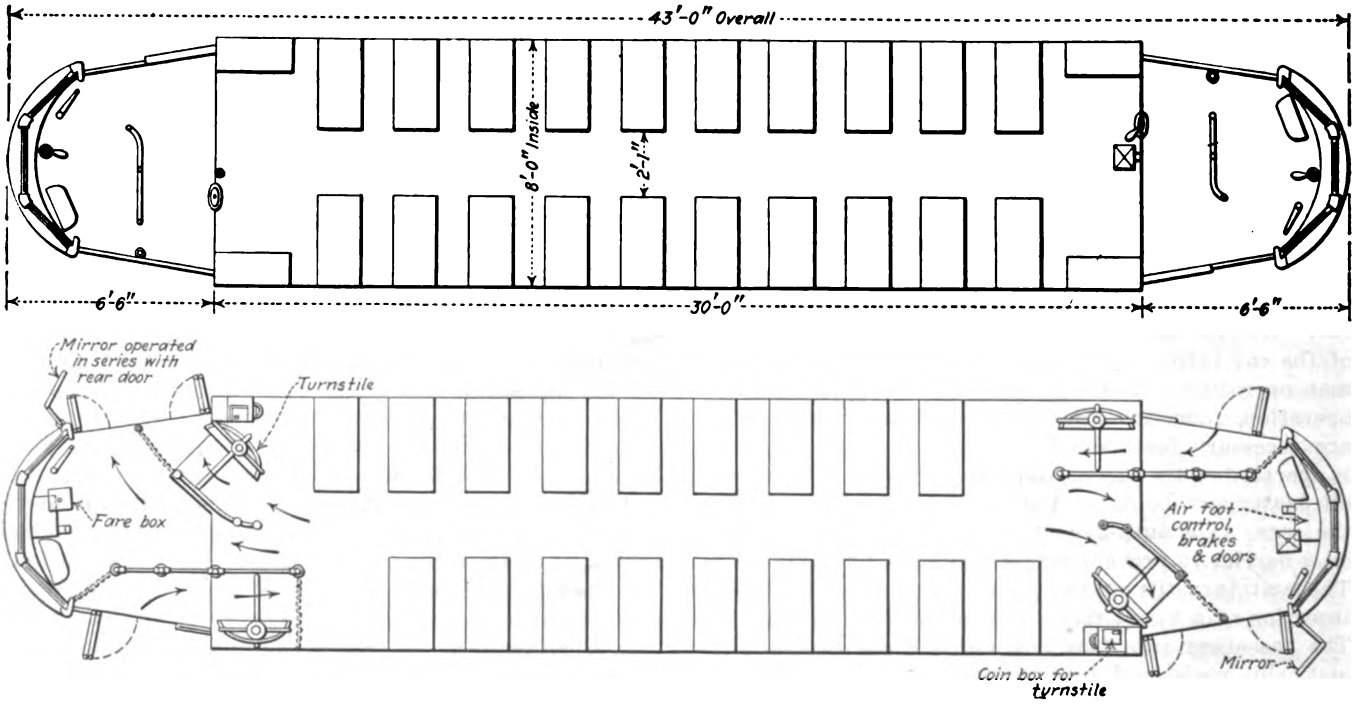
to give the operator a view of the inside of the car and enable him to see passengers as they leave their seats for exit.

The doors are operated by National Pneumatic door engines, electrically controlled, and are opened by means of a push button placed at the operator's left hand, while a selective switch is provided which permits him to leave either front or rear door closed as desired. Both doors are closed by means of contacts on the foot pedal, but the contacts for the front door may be closed before the operator wishes to close the rear door by the use of a small hand lever connected to the foot switch contacts. The front door is usually closed first to give the operator an unobstructed view in the mirror of the rear door.

The control is of a new design of automatic acceleration K controller. On the top of a standard K controller on each platform is mounted a balanced air cylinder with rack and pinion attached to the main drum shaft. The main controller handle is of the pivoted type, normally held at an angle of about 30 deg. from the vertical by a spring. The reverse drum is thrown manually.

When the small hand lever connected to the foot switch is thrown to the position which closes the front door it also energizes a circuit through magnets whose valves operate the controller air cylinder to place the main drum controller on the first point. The movement of the main drum to this position provides a pick-up circuit for the line switch through the door interlocks and the foot switch contacts. Therefore, after the foot switch is moved to the release position to complete the rear door closing circuit, and the last door closes, the line switch comes in and starts the car. The coming in of the line switch in turn operates the main drum magnet valves to advance the main drum under the control of a series limit switch to the full parallel position, thus giving automatic acceleration without any movements on the operator's part other than those necessary to close the doors and put the foot pedal in the full release position.

When the line switch is dropped out by returning the



FLOOR PLANS OF CAR. AT TOP, CAR BEFORE RECONSTRUCTION. AT BOTTOM, REMODELED CAR foot pedal to the running, lap, service or emergency positions the main controller drum is automatically returned to the off position.

Should the operator wish to operate the controller in reverse, or to any position other than full parallel, he has only to bear down on the pivoted controller handle (this movement draining air from the operating cylinder) and to operate the controller as a standard drum controller. This feature is particularly valuable in cases of controller failure and when dynamic braking is desired, the latter being thus independent of line current.

The air foot control mechanism is a modification of the McWhirter foot-operated control which has been in service on cars of the Third Avenue Railway System for several years. In addition to its use to close the doors and operate the automatic control as already described it operates a piston type straight air brake valve and an air-controlled emergency valve. The pneumatic combination provides for a delayed balancing of the door engines on all four doors after an emergency application from the foot pedal, instantaneous balancing of the door engines after an emergency application from the hand-operated "Conductor's" valve, a quick recharge of the emergency valve, and full pressure in the door pipe before the brakes release. Provision is made to apply and hold the brakes in emergency in the event of a broken pipe or reservoir cock or low air pressure. The control is interlocked to prevent trolley current being applied to the motors until the brake cylinder pressure has fallen to 35 lb., but this feature does not apply to dynamic braking.

It is to be noted from the above that aside from pushing a button to open the doors and throwing a small lever to close the front door all operations of motors, brakes and doors are controlled through the operator's foot pedal.

While this car has been operating in service for several months with a comparatively small number of defects, and while the operation has nearly reached the point where the car can make as good schedule as the same size of car operated with two men, the Third Avenue Railway still regards the car as experimental, and further changes may be made before a decision is reached as to its adoption.

Some Details of the French Midi Electrification

IMMEDIATELY after the cessation of hostilities in the late war the French government sent a technical commission to Switzerland, Italy and America to study existing railway systems. This commission recommended that 1,500-volt direct current be adopted as the standard for the electrification of all French railroads. Conforming with this decision the Midi Railway is using 1,500-volt direct current for all new installations and the sections already electrified at 12,000 volts will be changed to the lower voltage to secure uniformity.

The lines of the Midi Railway are mostly located in the south of France, north of the Pyrenees. As far back as 1906 the management commenced an exhaustive study of the electrification of this part of the system, having in mind the utilization of the water power available on the northern slope of the Pyrenees. By 1914 four sections had been electrified with single-phase current at 12,000 volts and 16.67 cycles. The war stopped all work.

Conforming with the new system power will be generated in six stations, or groups of stations, capable of developing a total of 362,000 hp. The stations will be put up progressively as the different sections are electrified. The head of water varies from 350 ft. in the station with the lowest head to a maximum of 2,500 ft. Power will be generated at 8,000 volts and 50 cycles and will be distributed to the railway substations over a 60,000-volt three-phase distribution system. Different points of the distribution system will be connected by a 150,000-volt transmission line.

The railway substations, which are located along the railroad at intervals of 12 to 18 miles, are connected directly to the 60,000-volt distribution system. They all contain rotary converters with the exception of a few in which mercury arc rectifiers will be used.

DETAILS OF POWER EQUIPMENT

The equipment for the generator stations, the distribution system, the railway substations and the locomotives will be built in France. The Westinghouse Electric & Manufacturing Company will supply a large part of the 150,000-volt transmission system, including the transformers, synchronous phase modifiers for the voltage control and the relay protective gear.

For the initial development three generating stations will be utilized. The 150,000-volt lines will connect these with the distant cities Pau, Dax and Bordeaux to the west and Toulouse to the east. At the generating stations 20,000-kva. banks made up of single-phase two-winding transformers will raise the voltage from 60,000 to 150,000 volts. At the substations near these cities the transmission system connects again with the distribution system through stepdown transformer banks of 20,000-kva. made up of single-phase three-winding transformers, lowering the voltage from 150,000 to 60,000 volts. These transformers have a third winding of 6,600 volts for feeding synchronous phase modifiers.

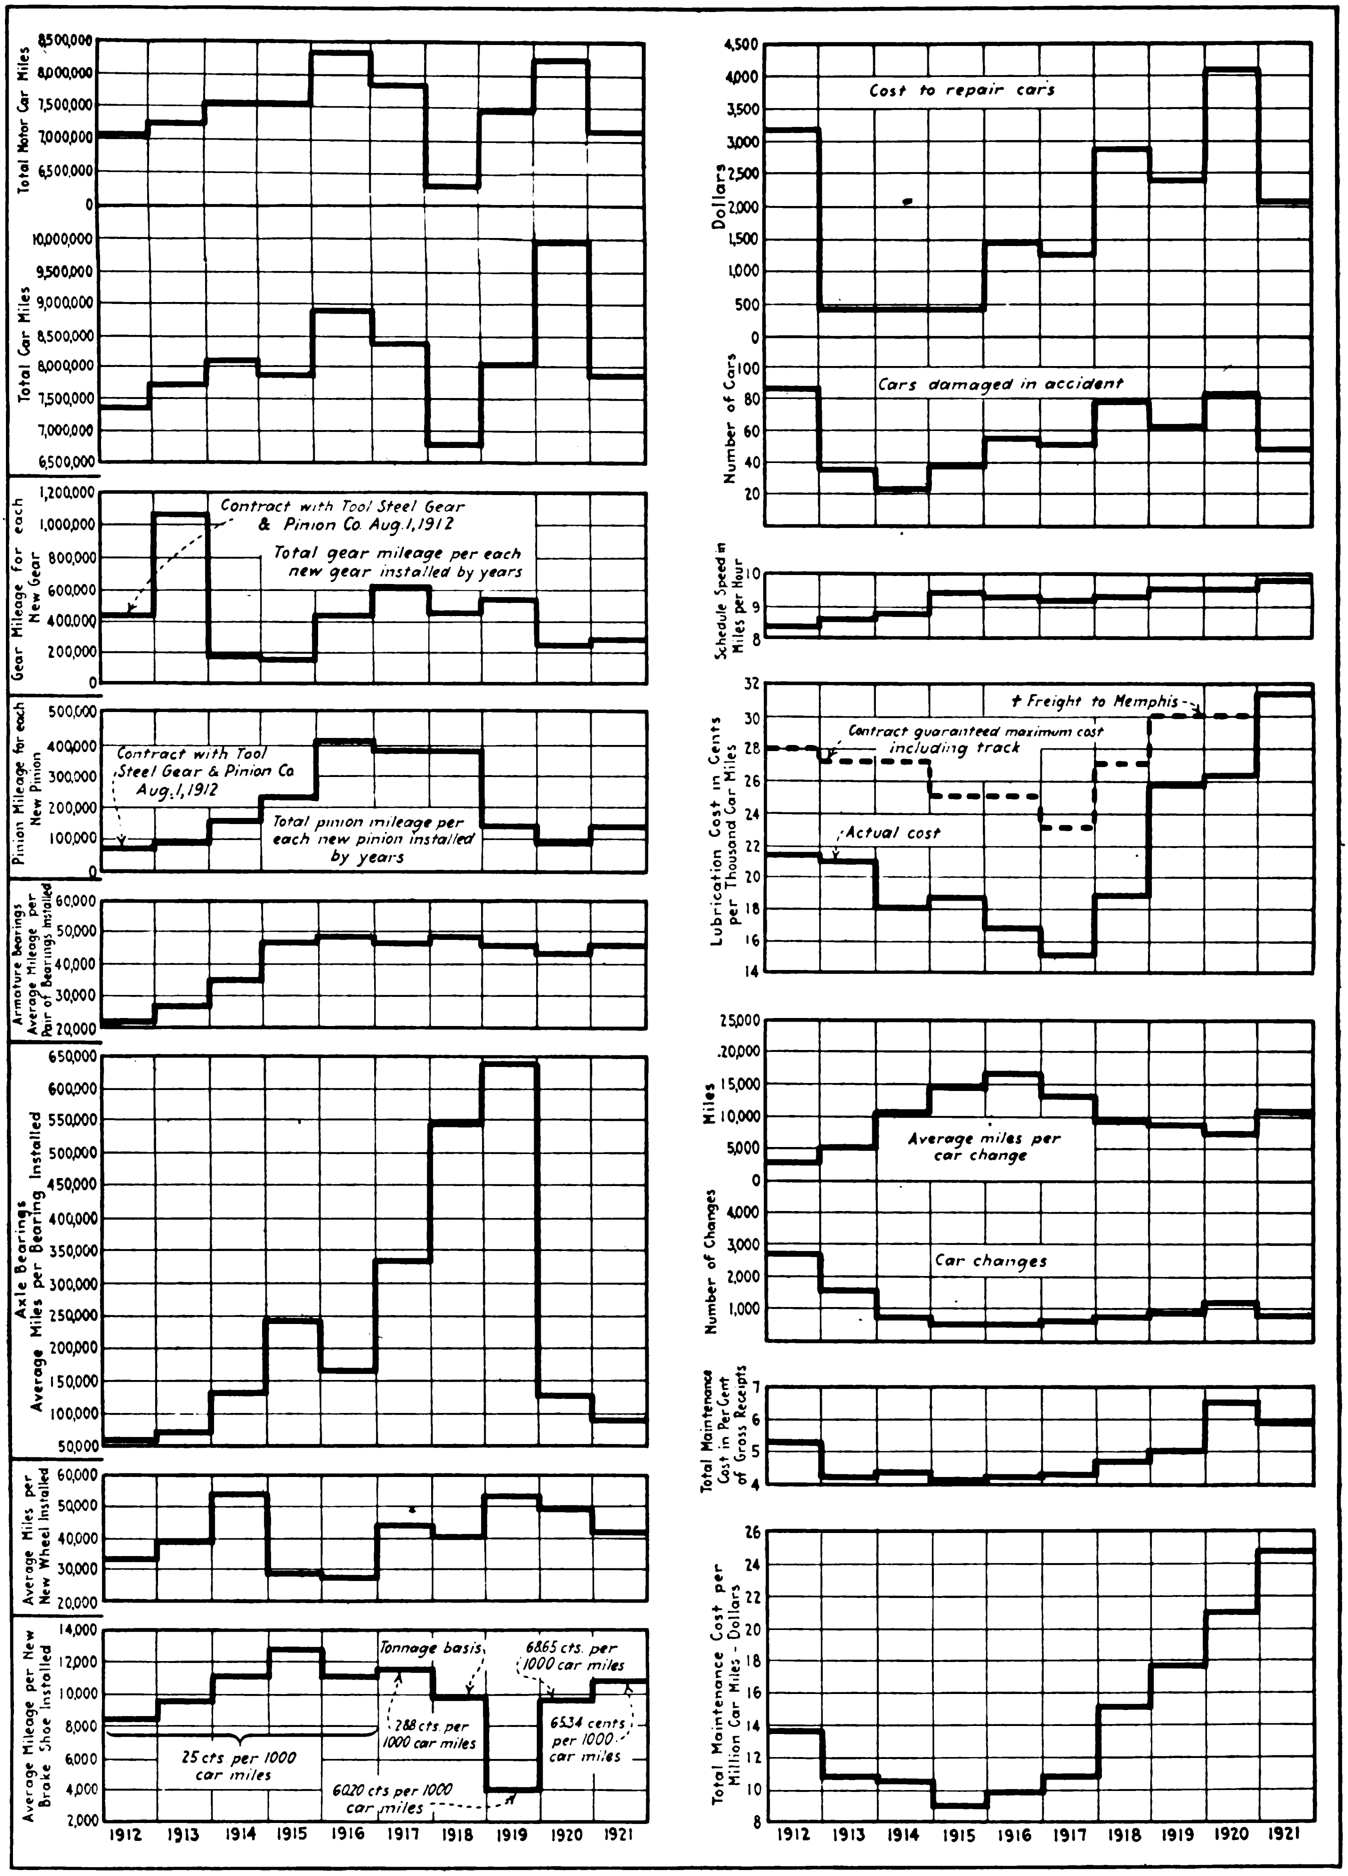
These machines are intended automatically to keep constant the voltage at the substation irrespective of the load. Owing to the length of the lines and the high voltage of the transmission they are designed to cover a wide range of reactive kilovolt-amperes.

At Bordeaux there will be two phase modifiers each of 15,000 kva. capacity and 7,500 kva. lagging capacity. At Dax and Toulouse there will be in each two machines of 8,000 kva. leading and 4,000 kva. lagging capacity. All these phase modifiers are equipped with the Westinghouse patent automatic voltage regulator designed to cause the machine to give the right amount of reactive kilovolt-amperes leading or lagging required to keep the line voltage constant.

A complete scheme of relay protection embracing the generator, distribution and transmission has been worked out. The generators and transformers are individually protected differentially; that is, they are automatically taken off the line in case of internal trouble.

The transmission and distribution are so laid out that the supply to the railway substation is assured. The lines are therefore for the most part in duplicate, except where sections are fed from both sides. Where the transmission lines are in duplicate they are equipped with balanced line protection by means of the recently developed Westinghouse directional relay, which does not require potential transformers. The whole relay scheme is so laid out that in case of trouble in any section of line or piece of apparatus the part in trouble is isolated without interrupting the supply to the rest of the system.

Ten-Year Records of Memphis Maintenance Statistics



Maintenance Records Used as a Bogey

Memphis Street Railway Has Kept Careful Record of the Performance of Its Equipment for Fifteen Years — Data Are Checked Up and Drafts Are Compiled as Incentive to Better Performance

THE Memphis Street Railway is one of the few companies which have kept systematic records of performance for different parts of its equipment over a number of years. These records are now proving invaluable as a means for testing new types of equipment and also the efficiency of the transportation and mechanical departments. Graphs showing records of a number of parts from January, 1908, to January, 1918, were published on page 806 of the issue of this paper for April 27, 1918. Through the kindness of A. D. McWhorter, superintendent of equipment and overhead lines of the company, these records have been brought up to date and are reproduced on the opposite page. On the following page is given an "efficiency report" for December, 1920, and 1921, together with figures for the twelve months of each year. These efficiency reports are made up each month for the month and for the year to date for both the present and previous years.

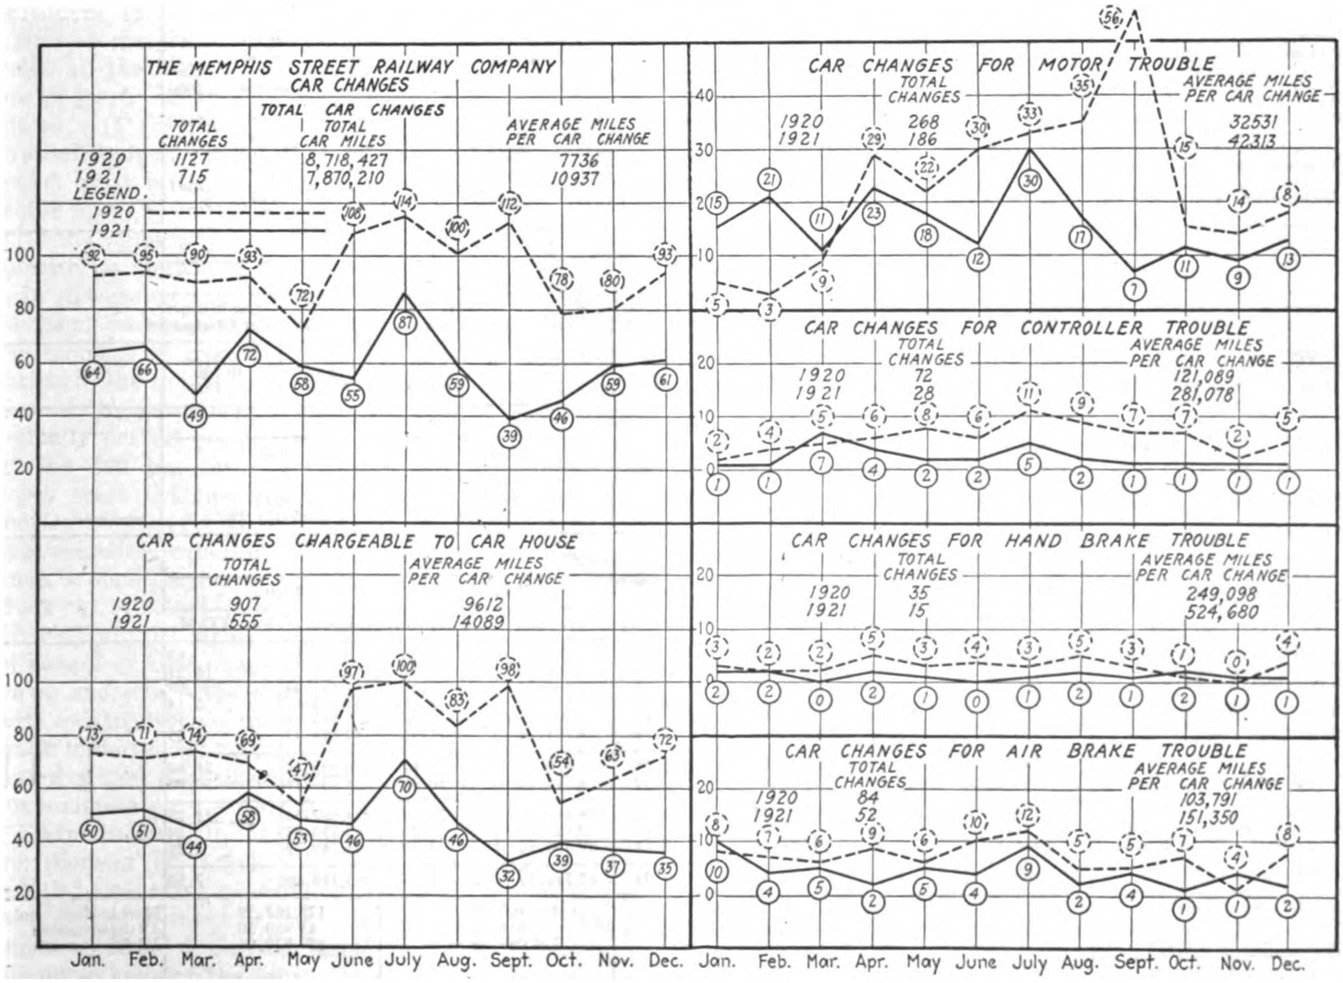
A statement giving the basis upon which the figures in the accompanying table are compiled by the company is published in the April 27, 1918, issue already referred to. This statement shows, for example, that the passenger car-mile figures are obtained monthly from the auditor's office, a separate entry being made for each different type of car. The schedule speed is obtained by dividing the total car-miles by the total car-hours; the number of cars turned out of the different shops is obtained from the daily report of the foreman of the machine shop and the monthly reports of the foremen of the carpenter shop and the paint shop, etc.

In addition the company keeps graphical records by months of the number of car changes and those chargeable to motor trouble, controller trouble, carhouse, hand-brake trouble and air-brake trouble. These charts form such a very good guide to the efficiency of the maintenance department that Mr. McWhorter has taken advantage of this fact to stimulate an effort to get better results.

In consequence, photographs of these charts, combining the figures for the current year and previous year, are hung in a conspicuous position in the shop. One of these charts, that for 1920 and 1921, is reproduced.

The original photographs are 12 in. wide by 9 in. high, and they are inclosed in a frame with glass. The practice of preparing and posting these charts is as follows:

On Jan. 1 of each year a new sheet is prepared, and the results of the previous year are placed on it in dotted lines. On Feb. 1 the record for January of that year is drawn on in a solid line, and on the first of each following month the same plan is followed, the figures



THESE RECORDS ARE POSTED IN THE SHOPS TO STIMULATE INTEREST IN BETTER MAINTENANCE for the current year being shown by a solid line. As each month's figures are charted, a photograph is made and replaces the photograph which has been posted in the shop for the previous thirty days.

A very gratifying degree of interest is exhibited on the first of each month by the foremen of the various departments when the chart is brought up to date. Each takes a great interest to be sure that the record for his division is lower than the previous month and for the corresponding month of the previous year.

Why Use Base Plates With Welded Rail Joints?

Base Plates Are Not Needed If a Correct Design of Joint Plate Is Worked Out—Additional Weight of Metal and Increased Amount of Welding Do Not Economically Solve the Problem

BY HOWARD H. GEORGE
Engineer Maintenance of Way, Public Service Railway,
Newark, N. J.

THE use of base plates with certain types of welded rail joints has recently been adopted by two of the large street railway companies in this country and increasing interest seems to be displayed among electric railway way engineers in their employment for this purpose, especially with those joints of the arc welded type where the base plate is also seam welded to the rail base.

While it is undoubtedly true that a base plate does strengthen the joint, it would seem as though its use, particularly with welded joints, is only dodging the real issue; that it is only a makeshift to overcome the mechanical defects in the splice bars themselves or to bolster up weakness due to defective welding, and that the proper thing to do is to work out a correct design for the joint plates which will eliminate the necessity for base plates. And at this time it might be well to emphasize the fact that it is not the writer's intention to argue the relative merits of the various types of base plates or welding processes now on the market, but rather, as an interested member of the American Committee on Welded Rail Joints, to bring out what he considers to be the salient features involved and to invite as complete a discussion as possible and thus develop all the facts in the matter. If the welding bars are properly designed, there should be no need for base plates. If they are not properly designed, then the present designs should be modified to suit the conditions which must be met. The use of base plates, however, would seem to indicate that something is wrong either with the welding bar design or with the welding process or with its method of application.

In discussing the theoretical side of this problem, an engineer recently said that to secure ideal conditions the moment of inertia of the rail section, as it passes through the joint, should remain constant. This, if possible to accomplish, would certainly provide a theoretically perfect joint, and is exactly what joint plates of the 100 per cent Duquesne, Bonzano and similar types were designed to approximate, the moment of inertia of the two bars at the center of the joint being approximately equal to that of the unbroken rail section. Such a construction is of especial importance in open track with bolted joints, particularly on steam roads where both the wheel loads and the speed are greatly in excess of those usually encountered on electric railways, and where the elastic nature of the roadbed permits relatively free wave action throughout the entire track under wheel loading. In such circumstances, it is essential that the stiffness of the rail at the joints should approximate very closely that of the unbroken rail.

Unfortunately, in no welded joint so far devised can the moment of inertia of all sections throughout its length be constant or equal to that of the unbroken rail, because the moment of inertia of the two bars must be added to that of the rail itself from the rail ends to the outer ends of the joint plates. This makes the rail much stiffer between these points, and the use of a base plate welded to the rail base serves further to increase this moment of inertia. In one case recently called to my attention where base plates welded to the rail base had been used sections of the rail base broke off when the joints were being spiked to the ties. Subsequent investigation showed that the base plates were decidedly concave toward the rail base, and that in the welding process this had apparently caused stresses to be transferred to the rail base, sufficient to cause breakage when the joint was spiked to the ties.

The nearest approach to the ideal condition is probably the butt weld, with the Thermit weld next in line. In the case of bolted joints, although the bolts are drawn up as tightly as possible, there is nevertheless always a slight movement between the fishing surfaces of the rail and splice bars. This tends to permit the rail to act somewhat independently of the bars as far as the wave motion is concerned, so that if the two bars have a combined moment of inertia at the center equal to that of the unbroken rail, ideal conditions have been approximated as closely as possible.

CONDITIONS DIFFERENT IN CLOSED TRACK

However, the theory which controls in the case of steam road practice is not so applicable to street railway conditions. This is particularly the case in city paved track, where the roadbed elasticity is either greatly restricted or may be entirely eliminated, in the case of track constructed with a relatively heavy rail on steel ties embedded in a solid concrete base. Thus, an engineer of a large Eastern street railway, whose track is being constructed with a 141-lb. 9-in. grooved girder rail on wood ties laid on natural ballast, said that with this construction he considered there was practically no wave motion in the rail while it was under car loading.

Ties in track in paved streets are usually spaced not over 2-ft. centers. For this span, the moment of inertia in the rails or splice bars usually used is far in excess of that actually required and the extreme fiber stress in bending actually experienced will not approach anywhere near the elastic limit of the material. Actually a rail section with a moment of inertia considerably less than that usually used would satisfactorily meet bending conditions, particularly where the joint plates are welded to the rail and are therefore in a position to develop their maximum resistance to bending. Inequalities in rail and splice bar sections, burred rail ends, etc., are not considered in this discussion as affecting in any way the stresses in the joint by reason of hammer blows which they would cause, as it is assumed that good practice requires the careful grinding of rail heads and the closure of the space between the rail ends for all welded joints and that in every case this will be done as well as practical considerations will permit.

In the case of standard T-rail sections, there is really not as much difference between the moment of inertia of rails and the standard sections of splice bars which are ordinarily furnished as one might imagine from merely a casual consideration of the subject. To be definite, the "Carnegie Steel Handbook" gives the moment of inertia of an 80-lb. A.S.C.E. rail section as 26.38, while that for two standard splice bars is 23, a difference of only 3.38. In the case of an 80-lb. A.R.A. type-A rail, the moment of inertia is 28.80, while that for two standard splice bars is 26.86, a difference of only 1.94. It should be a simple matter so to design the splice bars at the center as entirely to eliminate this difference, should this prove to be necessary or the desirable thing to do. In the case of the butt-weld joint, although the difference is undoubtedly not very large, an analysis will show that it does exist because of the enlarged section due to the squeezing out of the hot metal when the rail ends are pulled together by the hydraulic press. With the girder rail sections, however, the difference between the moments of inertia of the unbroken rail and its standard splice bars is considerably greater. In the case of L.S. 101-486, a 7-in. curved head tram, for example, the moment of inertia of the rail is 63.21, while that of a pair of standard splice bars is only about 24. The moment of inertia of the A.E.R.E.A. standard 7-in. grooved girder rail section L.S. 122-467 is 77.46, while that of the splice bars is only about 26.3. But, as explained above, conditions in paved street railway track construction do not require that the two should have equal moment of inertia to the same extent as in steam road practice.

Users of joint base plates certainly show a lack of confidence in either the strength of the bars or that of the seam welds. A better solution of the problem would seem to be to design the splice bars so that they would have whatever additional strength the situation requires and at the same time arrange the portion where the welds are to be made to facilitate to the greatest extent the process of welding. This will never be satisfactorily accomplished by office or laboratory studies alone. It is going to require considerable experimentation with different types and the knowledge of the men in the field that has been gained as the result of many unsatisfactory experiences.

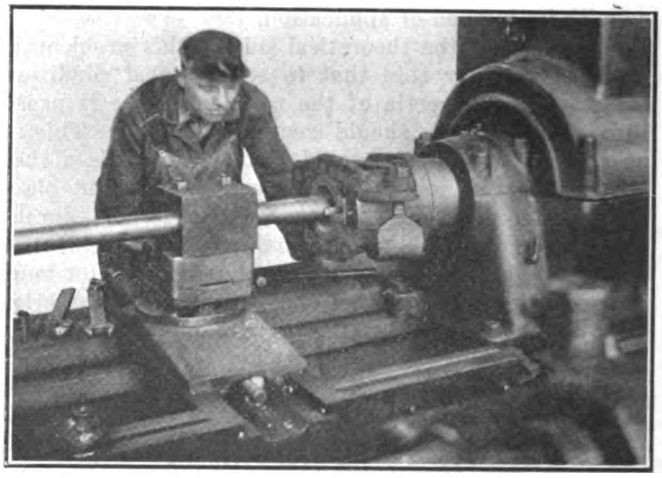
EXPERIENCE OF PUBLIC SERVICE RAILWAY

The Public Service Railway has welded approximately 130,000 joints on both old and new rail, covering a great many different sections in both open and closed track, with the Lorain bar weld process, and in not a single instance has a base plate been used or considered necessary, although several radical changes in the design of the welding bars had to be made since 1907 when the use of this type of joint was begun by the company. During the past few years we have also welded about 15,000 joints with the arc-weld process and the same statement applies to these joints, except that no material change has ever been made in the joint plate design from the usual typical standard bolted type.

To the best of my knowledge and belief it is an extremely rare occurrence to find a welded joint failure due to breakage of the bars at the rail ends or any other part of the bars. Almost without exception such failures as occur have been due either to pulling apart of the bar from the web of the rail at the point of weld, generally caused by failure to accomplish a proper weld, or, as is by far more frequent, by breakage of the rail itself just outside the outer weld, yet the total annual percentage of breaks is not excessive, considering all the circumstances of the rail welded. These results indicate very strongly that for ordinary street railway conditions (the track described being entirely of the ballasted type with wood ties laid on 2-ft. centers) the splice bars or weld bars commonly furnished for track joints have sufficient strength to meet any loading conditions ordinarily imposed on them.

It would therefore seem to be the logical conclusion that not only are joint base plates unnecessary, but they constitute an economic waste, both in total weight of metal in the joint and in the amount of welding required. Certainly, if the splice bars can be properly designed for welded joint work, and there is no reason to believe otherwise, it should result in a much more economical joint. A base plate will probably add about $2 to the cost of a welded joint, including the cost of the plate and the extra labor and welding involved, and it is very unlikely that the additional cost of a correctly designed welding bar would be anything like this amount more than the cost of the welding plates now being used. In open track the problem of rail joint breakage with the bolted type of joint has been very largely solved by the design of splice bars with depending flanges through the center section where the bending stresses are greatest, and it may be that a modification of splice bars of this general type to meet welding requirements and the introduction of this feature in the design of splice bars for girder rails will prove to be the solution of the problem. With the design of the plates properly worked out from the standpoint of mechanical strength as a beam, it should not be a difficult matter satisfactorily to complete the details of design from the standpoint of welding requirements, both as to the required length and cross-sectional area of the weld metal necessary to hold the plates in position indefinitely and, at the same time, provide the necessary electrical conductivity.

Convenient Jig for Boring Axle Brasses



JIG FOR BORING AXLE BRASSES

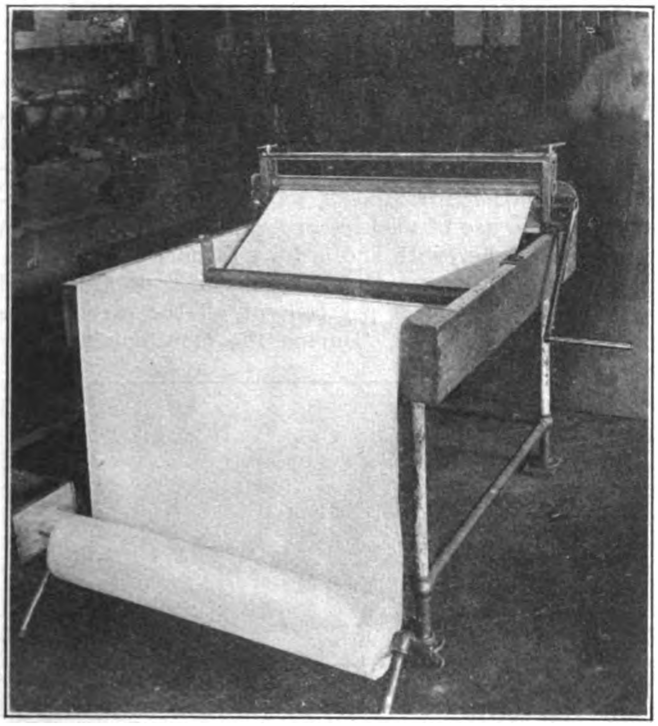
THE accompanying illustration shows a method of boring axle bearings as used by the Northern Ohio Traction & Light Company, Akron, Ohio. A special jig arranged to fit the headstock of the lathe is used. It has two clamping parts which clamp around the axle brass and hold it in position so that it can be readily bored out.

Equipment and Its Maintenance

Short Descriptions and Details of New Apparatus of Interest to the Industry. Mechanical and Electrical Practices of All Departments

Convenient Machine for Oiling Canvas

THE New York State Railways uses canvas pads between the field coils and the frame of railway motors in order to insure that the fields are kept tight. These canvas pads are oiled with linseed oil to insure their durability and to keep out moisture. The accompanying illustration shows a machine designed and built by F. W. Seeney, superintendent of shops for the railway company in Rochester. It consists of a wooden box with zinc lining, 42 in. x 48 in. x 7 in. deep, through which the canvas is fed by means of rollers. A roller in the center of the box under which the canvas passes forces this into the linseed oil, while two steel rollers at the end act as a wringer, thus removing the excess oil and at the same time pulling the canvas through so that it is readily rolled up. The box in which the oil is placed is supported by a 1-in. iron pipe framework. The two rollers which serve as a wringer are operated by means of a lever on the outside end, while the two inside ends of the rollers are connected by herringbone pinions. These are some which were removed from old compressors. The rollers are kept in contact by means of two springs and the pressure can be adjusted as required. Canvas 36 in. wide is used. This is removed from a roll which is placed in position on two pipe supports which rest on the floor. After the canvas has passed through the linseed oil it is put in a drying kiln for from ten to twelve hours, when it is then ready to be cut into pads.



MACHINE FOR OILING CANVAS

Cars for Boston Tunnel Operation

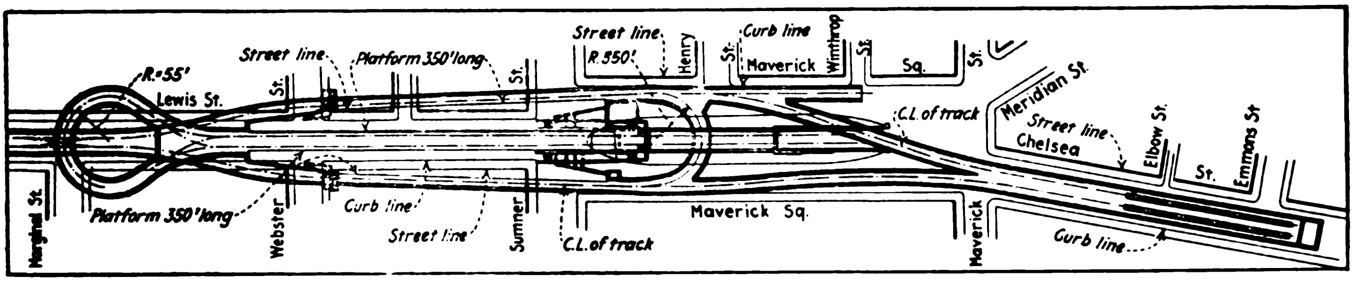
THE Transit Department of the city of Boston has made substantial progress in the construction of an underground terminal and loop at Maverick Square, at which point surface cars from East Boston and Chelsea will transfer passengers to the trains which will run from this terminal to Bowdoin Square. The Boston Elevated Railway will provide steel trains for this operation of a type similar to those now used in its elevated service. A comparison of the new cars with existing elevated rolling stock shows:

COMPARISON OF ELEVATED AND BOSTON TUNNEL CARS

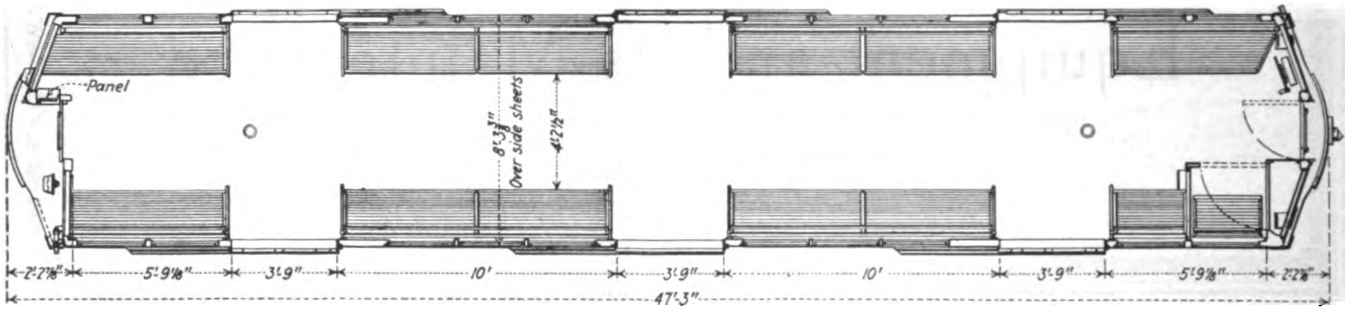
	No. 8 Elevated	East Boston Tunnel
Length over-all	46 ft. 7¼ in.	47 ft. 3 in.
Width over-all	8 ft. 9$\frac{7}{16}$ in.	8 ft. 7 in.
Number of seated passengers	44	44
Weight of car light	69,450 lb.	44,000 lb.
Weight, pounds per seated passenger	1578.4 lb.	1000 lb.

The new cars will be provided with three door openings on each side and will have longitudinal seats. As the cars will be operated in trains of two, four or six units, the cars will be permanently connected and will be separated only for repairs. With this method of operation, there will be a motorman's cab in one end of each car only, the cab ends forming the ends of the two-car unit.

On the present rapid transit cars the doors now are actuated by compressed air, which allows for the possibility of leakage of air at the various joints in the piping as well as at the door operators. On the new cars the doors will be operated by small motors with direct control connections to the operator. With this arrangement any air leakage or frozen pipes in cold weather will be obviated. The doors will be controlled



PLAN OF BOSTON TUNNEL EXTENSION



Floor Plan of New Cars

from the center of the two-car unit in a similar manner to the arrangement of the present cars.

The lighting of these cars will be provided by five 94-watt lamps with white opal reflectors as compared with the present arrangement of small lamps.

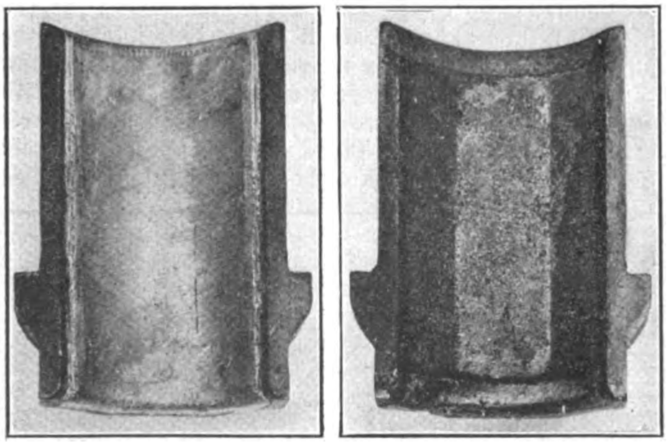
A new feature will be the "variable load brake," arranged so that the braking effort is increased as the passenger load is increased in an effort to obtain the maximum efficiency of the brakes at all times.

The East Boston Tunnel was originally constructed for surface cars and opened to the public on Dec. 30, 1904, as far as Scollay Square at a cost of $3,595,000. Its later extension to Bowdoin Square was opened to the public on March 18, 1916. The extension cost $2,389,000, making the total cost of the tunnel as it now exists $5,985,000, and up to the present it has been operated with surface cars in two and three-car train units.

The total traffic passing through the tunnel in both directions daily is 80,000, and under existing methods of operation it is impossible to provide adequate service. It is estimated that the construction of the terminal and changes in the tunnel itself will cost $2,750,000, and will make possible the operation of four-car trains and ultimately trains of greater length. This will permit third-rail operation with automatic safety stops, and in connection with this change the Boston Elevated has designed and contracted for forty steel cars for this service.

Anchoring Bearing Linings

THE accompanying illustration shows a type of journal bearing developed by J. E. Hester, master mechanic of the Union Traction Company, Anderson, Ind., to provide for anchoring the bearing lining and to eliminate the necessity for machine work and tinning. The portion of the bearing which is to receive the lining has beveled flanges at either end and at the sides, so that when the lining is poured into place it cannot get out of position. The bearing was designed primarily for use with lining metals, such as "Frary" or "Promet" metal, that have no tin content and that cannot be sweated to brass or bronze, but the scheme will work satisfactorily with any kind of lining metal.

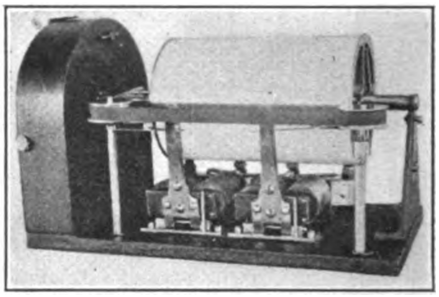


Journal Bearing Before and After Lining Has Been Installed

Headway Recorders Assist in Checking Schedules

THE USE of automatic headway recorders for checking schedules in Baltimore was referred to in a letter from Carl P. Nachod, published in the *Electric Railway Journal* for June 3, page 901. A further example of the use of such recorders for keeping cars on time is given herewith and is for a Middle West city.

Results for the month of April, 1922, on this road show that less than 1 per cent of all the cars in the city were off schedule. During the month there were 34,610 total scheduled car passes, of which 34,076 were checked by the recorder instruments. Of these 157 cars were two minutes or more early; 167 cars were five or more minutes late. This makes the total number of cars off schedule as 324 or 0.95 per cent. The 157 cars ahead of time totaled 315 car-minutes early and the 167 cars late totaled 960 car-minutes late.



Headway Recorder Removed from Weatherproof Box

Delays caused by general traffic conditions occurred on eighty-four cars which totaled 474 car-minutes. These were made up of delays due to heavy travel on thirty cars, totaling 173 car-minutes; delays due to weather conditions for one car, with 8 car-minutes; accident delays on five cars totaling 31 car-minutes, and delays due to cars being off schedule for forty-eight cars totaling 262 car-minutes. Forty-three cars were off schedule due to operating failures, totaling 248 car-minutes. These operating failures were divided into various causes, as follows: Track, nine cars, 50 car-minutes; power, four cars, 29 car-minutes; rolling stock, fifteen cars, 84 car-minutes, and transportation, fifteen cars, 85 car-minutes.

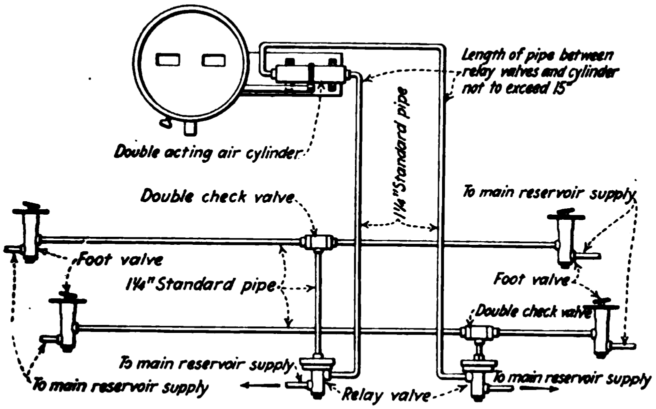
The delays due to foreign causes involved twenty-nine cars with a total of 167 car-minutes. Of these three cars or 24 car-minutes were due to vehicles on the track; five cars or 29 car-minutes were due to bridges; twenty-one cars or 114 car-minutes were due to steam railroads; and eleven cars, totaling 71 car-minutes, were late from a previous trip.

The total recorder hours for the month of April was 2,880, fifty-eight of which were lost. Of those lost twenty-four were due to the stoppage of the recorder clock, thirty hours were lost due to the operator forgetting to wind the clock, and there was a period of four hours in which the cars were off schedule and where no records were made. These fifty-eight hours amount to 2 per cent of the total recorder hours for the month.

What's New from the Manufacturers

Pneumatic Register Ringing Device

PNEUMATIC operation for overhead registers has been developed by the Pneumatic Register Ringing Device Company, St. Louis, Mo. This device is intended to simplify register ringing and eliminate the usual rods, brackets, and ropes extending throughout the car. To operate the register a double-acting air cylinder is mounted alongside and this is piped through a relay valve, which in turn is connected to foot valves for operation. The equipment is arranged to control either single or double-acting registers. The accompanying diagram of piping is for a double-end car with double-acting register.

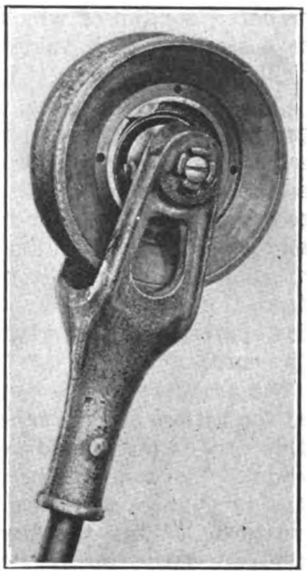


PIPING DIAGRAM FOR PNEUMATIC OPERATION OF DOUBLE-ACTING REGISTER ON DOUBLE-END CAR

Sliding Type Trolley Wheel

A TYPE of trolley wheel which has a sliding resilient motion when traveling in the forward direction, but which can rotate freely in the reverse direction has been designed and patented by Joseph L. Gutweiler and Frederick W. Kublin of St. Louis, Mo. A test of this type of wheel, mounted on a large freight locomotive, was made on the Decatur division of the Illinois Traction System.

The construction of the wheel is shown in the accompanying illustration. It consists of a steel outer rim which has a groove of the usual shape to receive the trolley wire. A split friction ring is fitted to the inside of this outside portion and a heavy flat coiled spring is connected between this friction ring and a clutch which is connected to the hub and shaft through a pawl. This construction gives the wheel a resilient motion under ordinary conditions when the car is traveling forward. The coiled spring holds the wheel so that sufficient tension is provided to give considerable friction between the friction ring and the outer portion of the wheel. However, should the wheel be subjected to a blow or excessive pressure, it can rotate in the forward direction. Thus when traveling forward around sharp curves the friction will sometimes be sufficient to cause the wheel to rotate. The same condition prevails under bridges, and at other locations where there is high pressure between the wheel and the wire. This occasional rotation in the forward direction is an advantage in providing a new spot for the sliding contact, so that the entire surface of the groove is used at frequent intervals.



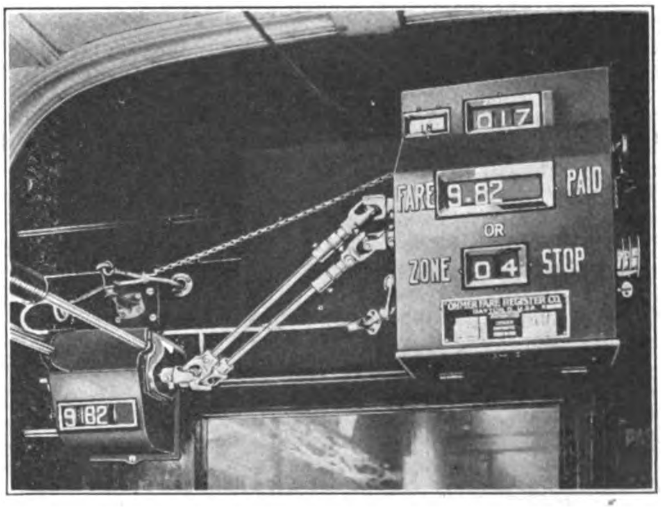
NEW TYPE SLIDING TROLLEY WHEEL

While the wheel is normally a sliding contact type when traveling in the forward direction, the hub and pawl construction permits free rotation of the wheel when the car is being backed up and thus prevents any liability to dewirement. The size and construction of the wheel are such that standard trolley harps can be used.

New Fare Register

THE Ohmer Fare Register Company has placed on the market its new No. 62 detail fare printing interurban register. The new register is designed for use where a very large variety of cash fare values are handled as well as the usual paper fares, and where a detailed printed record of each fare is desired with the origin of the fare indicated and the registrations in each zone shown.

The register has a capacity for handling any cash fare from 1 cent up to $9.99. It also handles the various non-cash denominations such as tickets, pass, commuter, round-trip, half-fare, coupon, mileage, school,

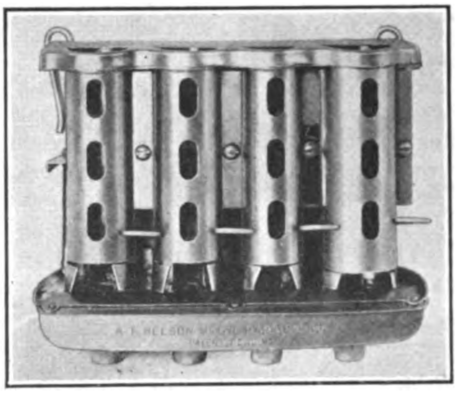


NEW REGISTER GIVES DETAIL RECORD OF EACH FARE transfer, etc., all of which may be registered according to designated cash values as well as under their particular denominations if it is so desired.

The amount and the classification of each fare is printed in the record, together with its consecutive number and the number of the zone in which it was collected. The register is operated in a manner similar to other types of Ohmer registers by means of two rods and a cord. The auxiliary indicators which are placed at each end of each compartment differ considerably from the dial indicators used in other types of Ohmer installations. The registration is completed by pulling the cord.

An auxiliary cord is connected with the zone indicator at the bottom of the register. As a new zone is entered this cord is pulled and the zone indicator advances one count. The zone number is printed on the record with the amount of the fare. The zone indicator counts up to 99. When the direction indicator is changed at the end of the line and the trip count set back to zero, the zone count reverses automatically. Improvements provide against the register getting out of order and for convenience in operation.

New Features in Change Carrier



IMPROVED CHANGE CARRIER

THE Cleveland (Ohio) Fare Box Company is distributing an improved type of Nelson change carrier. The size, weight and number of parts have been reduced from the type previously sold. To avoid breaking special attention has been given to the springs used. The change carriers are made with four tubes, but the end frame is so designed that an extra tube for pennies or tokens can be added if desired. A positive safety lock is provided on the ejector adjustment. Other details were published in *Electric Railway Journal* for Sept. 17, 1921, page 448. The tubes are 4 in. long.

National Personnel Association Formed

TO STUDY the human factor in American business and industrial life, to solve the problems which confront the management of the nation's industrial enterprises, and to bring about a better understanding of the labor question, leaders of organized engineering, representatives of large industries, insurance companies, railroads and publishers, and members of university faculties have organized the National Personnel Association.

The announced purpose of the movement is "to advance the understanding of the principles, policies and methods of creating and maintaining satisfactory human relations within commerce and industry." The new organization takes over the activities of the National Association of Corporation Training and the Industrial Relations Association of America. It will aim to aid business executives in solving problems of personnel administration. Co-operative research will be conducted on a nation-wide scale, and close relations will be established with colleges and universities in carrying out an extensive educational program.

W. W. Kincaid of Niagara Falls, head of the Spirella Company, has been named president of the new organization. Earl B. Morgan, the Curtis Publishing Company, Philadelphia, is vice-president, and Montague A. Clark, E. I. du Pont de Nemours & Company, Arlington, N. J., is treasurer. W. J. Donald, 20 Vesey Street, New York City, is the managing director and secretary.

An executive committee and a board of directors, representative of many of the country's biggest institutions, have been chosen. Members of the executive committee, whose election has just been announced, include: Sam A. Lewisohn, Miami Copper Company, New York; John McLeod, Carnegie Steel Company, Pittsburgh; J. M. Larkin, Bethlehem Steel Company, Bethlehem; C. S. Ching, United States Rubber Company, New York; Ben A. Franklin, Strathmore Paper Company, Mittineague Falls, Mass.; W. H. Winans, Union Carbide and Carbon Corporation, New York; J. W. Dietz, Western Electric Company, New York; Harvey G. Ellers, Armour & Company, Chicago; Francis Farwell, Worthington Pump & Machinery Corporation, New York; Milton D. Gehris, John B. Stetson Company, Philadelphia; Harry A. Hopf, H. A. Hopf & Company, New York; George F. Quimby, Associated Industries of Massachusetts, Boston; S. R. Rectanus, American Rolling Mill Company, Middletown, Ohio; and Arthur H. Young, International Harvester Company, Chicago.

The board of directors includes a long list of prominent men, among whom are: L. P. Alford, New York, vice-president American Society of Mechanical Engineers and a member of the executive board of the American Engineering Council; L. W. Wallace, executive secretary Federated American Engineering Societies, Washington, D. C.; Alvin E. Dodd, United States Chamber of Commerce, Washington; E. S. McClelland, Westinghouse Electric & Manufacturing Company, East Pittsburgh; Miss M. T. Reuse, American Telephone & Telegraph Company, New York; F. W. Thomas, Atchison, Topeka & Santa Fé Railroad, Topeka; Kendall Weisiger, Southern Bell Telephone Company, Atlanta.

Sixteen committees, which during 1922 will make reports on national economic and industrial problems, have been selected. The sponsors of the movement, it was said, feel that the work of the association is certain to have a beneficial effect on industry and commerce generally.

American Association News

Procedure for Obtaining Coal

THE American Electric Railway Association has sent to all member companies information as to the suggested procedure for obtaining essential fuel supplies.

In general there will be two main classes of conditions which may confront electric railways. They may have a contract with a coal company which has mines in operation, or they may have no contract, or the contract may be with a company which is not producing coal. In either case, as a utility, the railway automatically belongs in priority Class No. 2, under Interstate Commerce Commission Order No. 23.

If the railway has a contract with a company now producing coal it should communicate at once with the coal contractor and call attention to the fact that the railway as a utility belongs in priority Class No. 2; ask him to see to it that all bills of lading for coal consigned clearly indicate that the coal is for a public utility and is furnished under priority Class No. 2 and request that he take vigorous steps to have his full share of cars allotted to him for handling the coal.

Then, if the coal company is unable to get adequate car allotment, or if the coal is seriously delayed by car congestion, or other railroad troubles, or if the coal is confiscated, advise J. P. Jackson, national representative of the joint fuel committee of the Utilities Associations, 949 Munsey Building, Washington, D. C., giving full information, including a copy of all important correspondence and papers in the case.

A railway with no contract or one with a company not producing coal, should buy coal at "Hoover price," if possible, and proceed as above.

If the condition becomes desperate, whether the railway has a contract or not, it should apply to the state fuel authorities for approval of a Class 1 priority application. Form No. 50 should be filled out, together with affidavit and guarantee of payment. In addition, the Washington representative, Mr. Jackson, should be notified, giving full particulars. Class 1 priority will be granted only in cases of very great emergency where shutdown would be serious to the public welfare.

The Federal fuel distributor, Mr. Spencer, specifically requests that utilities avoid bidding against each other for coal and thus raise the price. Co-operation with the authorities both on matters of supply and price is essential. It should be appreciated, however, that the obligation of railway franchises and to the public require the uninterrupted operation of these public services and every company will spare no effort to insure continuity of service.

T. & T. Executive Committee

ON JULY 29 a meeting of the executive committee of the Transportation & Traffic Association was held at the Secor Hotel, Toledo. Those in attendance were L. H. Palmer, president; G. T. Seeley, first vice-president; and T. C. Cherry, J. H. Hanna, C. E. Morgan, W. H. Boyce, H. B. Flowers, E. M. Walker, and James W. Welsh, executive secretary. The meeting was called primarily to review reports and prepare for the Chicago convention.

The first matter taken up was the suggestion of Past-President Stevens at the last convention that the number of vice-presidents be changed and that the work of the association be begun each year more promptly after the close of the convention. The decision was reached not to recommend any change in the constitution with regard to the vice-presidents, but to adopt the second recommendation of Mr. Stevens. During the coming year committees will be instructed to hold their first meeting not later than Dec. 1.

The secretary reported that he had included in his Aug. 1 service letter an inquiry on the present use of the classification of freight accounting.

The reports on merchandising transportation and traffic regulations were then presented and approved. An abstract was also presented of the forthcoming report of the committee on safety. It was referred to L. S. Storrs, publication committee, for final approval. C. E. Morgan outlined the report of his committee on one-man car operation, which is to come up for final approval at the next meeting of the executive committee of the American Association, to be held on Aug. 25.

It was decided not to make any additions to the interurban rule book. The secretary was instructed to compile a list of the special requirements on safety devices adopted by the various public utility commissions.

Plans to stimulate discussion at the various sessions were then discussed. It is expected that there will be a discussion of the weekly pass during the report of the committee on merchandising transportation, and of turnstile cars and light-weight interurban cars at the meeting at which one-man car operation will be considered. President Palmer explained that at the meeting at which the report on traffic regulations and safety work will be considered, the Claims Association will be asked to participate in the discussion.

It was decided not to make a general distribution of advance copies of the reports this year, but the reports will be printed and copies will be sent to those who expect to make a formal discussion of them or who make special requests for such reports. Printed copies of the reports will also be available at the meetings.

Executive Committee of the Engineering Association

A BRIEF NOTE was printed in last week's issue of this paper about the meeting of the executive committee of the Engineering Association in New York on Aug. 9. It was an all-day session, as this is the final meeting of the whole committee before the time of the October convention, and much business was transacted.

Resolutions were passed on the death of A. B. Stitzer, vice-president of the association. They will be engrossed and signed by each member of the committee and then will be forwarded to the family of Mr. Stitzer.

Secretary Welsh and G. C. Hecker, special engineer, were asked to investigate and report on some method by which headquarters can be advised of legislation passed in any state regarding engineering specifications. E. M. T. Ryder, at the request of Mr. Cram, outlined the work of the welded rail-joint committee of the American Bureau of Welding, and explained how his subcommittee had co-operated with that committee. He also urged the authorization of an appropriation of $20,000 from the American Association to finance the proposed test on rail joints recommended by the way committee. At the request of Mr. Kimball, Messrs. Cram and Ryder will prepare a budget of the expenses and a statement of the reasons for engaging in the test, and the matter will be presented to the executive committee of the American Association at its next meeting. A request from H. H. George to have certain German pamphlets on wood preservation translated was considered. This request was indorsed by Mr. Cram, who explained that these pamphlets described the use as a preservative of sodium fluoride, with which there had been very little research work in this country, and the results in Germany indicate that this material has great possibilities as a wood preservative. The pamphlets were turned over to Mr. Harte, who will have this work done.

At the suggestion of Mr. Harte, the president was authorized to appoint a special committee to prepare suitable specifications covering air tanks for use on electric railway cars to be offered to the boiler code committee of the American Society of Mechanical Engineers in connection with the specifications which that committee is developing for unfired pressure vessels. The special committee was also asked to request that the boiler code committee include in its specifications pressure tanks used for oil burning and gasoline burning heated torches, and to co-operate as far as possible with the special research committee of the American Bureau of Welding, which is also studying the subject of pressure tanks.

An invitation was then read from the commercial attaché of the Brazilian Embassy to the association to send a representative to the International Congress of Engineers, to be held under the auspices of the Brazilian Government at Rio de Janeiro, Sept. 7 to 30. The committee voted to recommend to the American Association that V. L. Havens, editor *Ingeniería Internacional*, be appointed representative of the association.

It was decided to appoint a special committee to (1) study and make suggestions for the revision of the mechanical form of the *Engineering Manual* and (2) supervise from year to year all specifications adopted and revised and see that the *Manual* is kept up to date, co-operating with the secretary's office, particularly with respect to elimination of errors in specifications. This committee will be made up of three members of the executive committee, with terms of office so arranged that after the first year there will always be at least one member of the committee having had one or more year's experience on the committee.

A set of rules to govern the discussion of papers at the convention was submitted and accepted, and the secretary reported that the chairmen of the different committees had been asked to suggest the names of men to discuss their reports. The report was also read of the committee on reorganization of the methods and practices of the Engineering Association. It evoked a great deal of discussion, but no final action was taken on it. The tentative program for the October convention was approved.

Special reports were also received from F. J. White and C. R. Harte, representatives on the sectional committee of the A.E.S.C. on the standardization of wires and cables, and from F. McVittie, representative on the sectional committee of the A.E.S.C. on lightning protection. The members of the executive committee expressed their appreciation of the work of the representatives of the association in making these special reports.

News of the Electric Railways

FINANCIAL AND CORPORATE :: TRAFFIC AND TRANSPORTATION
PERSONAL MENTION

All Buffalo Places Filled

Lines There Now Fully Manned—Company Preparing to Start Up in Niagara Falls

Employees of the Philadelphia Rapid Transit Company who have been in Buffalo operating cars for the past month, because of the strike of trainmen on the local and interurban lines of the International Railways, are starting to return home. Their places are being filled by permanent employees recruited in all parts of the country.

New Organization Now Functioning

In this manner the International is building a new organization of trainmen and a new permanent seniority list has been started so that employees on strike who return to work will be re-employed only after they have applied for work as new employees and will thus be required to take their places at the foot of the seniority list. Just now the company has more men than is necessary to give normal service on all local and interurban lines.

Traffic has increased on the West Side and the interurban lines, but practically no passengers are being carried on the East Side lines, which serve sections of the city populated largely with foreign-speaking people.

Despite the decision of the courts that the jitneys are running in defiance of the law, few arrests are being made and many people are using this means of transportation. Jitneys are running without distinguishing signs and fares are collected in the form of donations.

In his decision which followed the appeal of the municipal authorities from the ruling of Justice Pooley that the Mayor should enforce the state law against jitneys which have not secured the necessary permits, Justice Krause of the Appellate Division stays the mandamus order until an appeal can be taken to the Court of Appeals in September. He has ruled, however, that:

Mayor Made Responsible

> The stay is not a license for unlawful jitney service, nor does it lessen the duty of the Mayor to enforce the law. It merely suspends during the pendency of the appeal specific directions contained in the mandamus order, leaving the Mayor unhampered in the discharge of his official duties, which he has sworn faithfully to discharge.

The court also rules that:

> It is unlawful to operate upon the streets of the city a bus line, stage route or motor vehicle line or route, or any vehicle in connection therewith or any vehicles carrying passengers at the rate of fare of 15 cents or less for each passenger, within the limits of the city, or in competition with another common carrier which is required by law to obtain the consent of the local authorities, without the consent of the local authorities and a certificate of convenience and necessity from the Public Service Commission. Unlawful jitney service is a misdemeanor under the provisions of section 29 of the Penal law (People *ex rel.* Weatherwax *vs.* Watt, 115 Misc. 120; 197 A. D. 929).

At a meeting of the general executive board of the Amalgamated in Detroit, a fund of $15,000 a week was voted for the support of the strikers in Buffalo. It is reported that no strike benefits have been paid although the strike is now in its eighth week.

Owl car service has been restored on several of the local lines of the International, making complete the restoration of local service. Early in the week it was proposed to start local service on the lines of the International in the city of Niagara Falls. Service already is being given on the Park & River division and across the upper steel arch bridge over the Niagara gorge. Local service has not been started in the city of Lockport. Cars are being operated over the Olcott-Lockport division and fruit trains hauled by electric locomotives are being handled over this division.

Judge Harlan N. Crosby, sitting in equity term of the Supreme Court of Erie County on Aug. 16, granted the company's request for a blanket injunction against the Buffalo Jitney Owners' Association and its 200 members restraining them from operating jitney and bus lines within the city. The injunction is non-returnable so that jitney drivers who are arrested by city police or detectives of the International will be brought directly into the Supreme Court and committed to jail for contempt. Passengers riding in jitneys when arrests are made will be taken to police headquarters where they will be required to make signed statements. President Tulley of the railway believes the blanket injunction will put an end to the unfair jitney competition.

Arbiters Decide on Cut of Five Cents

According to a decision of the arbitration board employees of the Memphis (Tenn.) Street Railway must accept a decrease of 5 cents an hour instead of receiving an increase of 7 cents which the men had sought. The reduction is retroactive to Aug. 1.

According to the findings of the board, first year men will receive 38 cents an hour; second year men 43 cents an hour and third year men 48 cents an hour. The wage contract which expired on July 31 called for 43, 48 and 53 cents.

The decision was signed by F. N. Fisher representing the railway and Judge A. B. Pittman, the neutral member. Considerable agitation has been aroused over the decision and a mass meeting of motormen and conductors has been called by union leaders.

Bar Association Condemns Bacharach Bill

At sessions of the American Bar Association held in San Francisco, Aug. 7 to 11, discussion of the Bacharach bill and similar legislation resulted in the adoption of resolutions placing the association definitely on record as opposing that type of legislation. At a meeting of the public utility section of the association on Aug. 8 the following resolution was adopted:

> *Resolved*, That the section on public utility law of the American Bar Association hereby expresses the emphatic opposition of its membership to the Bacharach bill, now pending in Congress (H.R., 10,212), and to any similar legislation designed to limit or destroy, as to any particular class of litigants or rights, the present equitable powers of the federal courts to enforce the guaranties of the Federal Constitution for the protection of persons and property.
>
> *Resolved* further, That the section asks its chairman in his report to the association to present at least in outline the considerations which have been developed in the discussions before the section as demonstrating the extreme unwisdom of any such radical curtailment of the Federal judicial power.
>
> *Resolved* further, That the chairman of this section and the special committee created at to-day's session are authorized in behalf of the section to take such further steps as in their judgment may be advisable to bring about an indorsement by the association of the action of its committee on jurisprudence and law reform in actively opposing the Bacharach bill at the present session of the Congress, and also to support before the association any suitable resolutions which may be offered in condemnation of that or similar legislation.

At a general session of the association on Aug. 10, the committee on jurisprudence and law reform, Henry W. Taft, chairman, presented its report, including as a part of that report the resolution adopted by the public utility section and expressing definite opposition to the Bacharach bill as follows:

> Three hearings have been had upon this bill. At one of these a member of this committee, Mr. Harriman, attended and pointed out the objections to it upon the grounds referred to in the previous reports. The chairman also presented a similar statement. After considering the subject carefully this committee unanimously voted that it disapproved the bill. Information as to this vote has been presented to the judiciary committee of the House, which has had the matter under consideration.

The committee report was unanimously adopted by the association.

Another Utility Sheet Appears

Another property which wants the good will and co-operation idea fostered is the Interstate Public Service Company, Indianapolis, Ind., publishers of a new sheet called *The Interstate News*. The pamphlet will be issued monthly and according to Harry Reid, president of the Interstate Company, its columns will keep the public informed of the railway's doings and its plans for future operation. The première of this paper outlines a plan of the company for the sales contest on the prior lien stock.

Louisville Grant Fails

Steps will be taken at once by the Louisville (Ky.) Railway to protect the company's property in the courts. Announcement to this effect was made by James P. Barnes, president, following the failure of the lower board of the General Council to pass the Mayor's fare ordinance, which came up for consideration during the week ended Aug. 12.

No legal action is contemplated until the fall term of the Federal Court, Mr. Barnes said, but attorneys have been instructed to proceed at once to obtain protection for the company's property.

It was reported that the company would give the General Council a limited time in which to pass the ordinance since it had been voted down by the lower board, as the board of aldermen was known to favor it, but Mr. Barnes stated that such was not the case. A statement by the company says:

> We have met the suggestions of the Mayor and city attorney in an earnest effort to arrive at a compromise that would end the litigation expensive to both sides and at the same time protect the interest of the public and our stockholders.
>
> In that spirit we agreed to accept a rate of return for the company which was less than we believed the investors were entitled to, and less than the courts would give an investor on the review of the evidence.
>
> I have no criticism to make of the acts of any city official, but as there has been a delay of several months, I have, in order to protect the interest of the company, instructed our legal department to proceed as rapidly as possible in the courts to obtain the full measure of protection under the Federal constitution for the company's property.

Interurban Wage Scale Renewed for Another Year

Continuation of the present wags scale for another year after Aug. 15 was provided in an agreement reached on Aug. 10 at Springfield, Ohio, between the Indiana, Columbus & Eastern Traction Company and its trainmen. The agreement affects all platform men employed by the line, as well as those employed on the Columbus, Newark & Zanesville Railway.

With one exception, the working conditions are to be unchanged. The exception, proposed by the men and readily accepted by the company, provides further recognition of seniority rights by permitting those longest in the service of the company to choose temporary runs of thirty days or more instead of regularly scheduled runs, if they so desire.

The wage scale agreement continues the rates which were decided by the arbitration board appointed last March to compromise the differences between the men and the company which existed at that time.

The scale for interurban motormen and conductors is 36 cents an hour for the first three months, 41 cents for the succeeding nine months and 47 cents an hour thereafter. Freight brakemen receive 34 cents an hour.

Conductors and motormen on the city lines operated by the companies at Lima, Newark and Zanesville receive 34, 39 and 44 cents on the same basis. Practically all of the men have been employed by the company for a period of more than a year.

The negotiations were marked by an unusually friendly atmosphere. The men first suggested a maximum of 51 cents an hour, but after Receiver J. H. McClure explained the difficult conditions facing the company the men agreed to continue the present scale for another year.

Normal Conditions Restored

Formal Wage Agreement Now Being Drafted Between Men and Management at Chicago

With the close of the strike and the resumption of service on surface and elevated lines in Chicago on the evening of Aug. 6, the only reminder of the six-day tie-up is a few 5-cent fare buses started by the city administration. At the height of the strike this competitive system was said to have included twenty-one buses. After a week it had dwindled to three vehicles, the rest having been abandoned as being unprofitable. It is said to be the intention of Mayor Thompson to keep these three in the field until November, when he hopes to have the voters approve his plan for investing $3,000,000 of the traction fund in a greater number of vehicles.

For a few days after the close of the strike it is said both companies experienced a small reduction in traffic, due to the fact that some persons were still using the commutation tickets purchased from steam roads. Business was said to be normal by the end of the first week of restored service.

The drafting of a formal contract for the new wage scale had not been concluded between surface car trainmen and the management up to Aug. 15, but no difficulty is expected over this because the only change will be in the new wage rates and the inclusion of a thirty days' cancellation clause to be used in the event that the rate of fare is disturbed by the Illinois Commerce Commission.

The new wage scale will be 65, 68 and 70 cents for the first three months, next nine months and after-one-year periods, respectively. The rate on night cars will be 72 cents. The contract will date from Aug. 7 and continue for one year. Practically all other employees will have their pay reduced on the same basis of 10 cents an hour.

Recreation Club Formed.—The Employees' Recreation Club of the Little Rock Railway & Electric Company, has been formed at Little Rock, Ark., with 131 pledged members. A tract of land near Little Rock has been purchased by officers of the company to be leased to the club. It is planned to erect bath houses, enlarge a bathing pool and to make other improvements to equip the place for swimming, fishing, hunting and other outings.

Indiana Cities to Seek Amendments to Commission Law

An organization of cities of Indiana to oppose increases in utility rates and to bring about legislation, particularly amendments to the public service commission law, was agreed on by mayors and city attorneys of several Indiana cities at a meeting held recently at the invitation of Mayor John C. Quick, Muncie, Ind.

Mayor R. O. Johnson, of Gary, argued that the law should be repealed and rate-making and control of utility corporations should be returned to city councils. Most of the city attorneys present, it was said afterward, opposed repeal of the basic law, but urged the need of amendments designed to open the way to a stronger presentation of the "case of the people" than under the present operation of the law. Cities represented at the meeting were South Bend, Hammond, Gary, Anderson, Newcastle, Elwood, Crawfordsville, Vincennes, Indianapolis, Muncie, Whiting and East Chicago.

It will be recalled that last Spring Mayor Lew Shank of Indianapolis declared that he intended seeing to it that some change was made in the law or the entire commission done away with.

Indiana Association Aroused to Action on Threatened Utility Legislation

A letter urging support of the principle of state regulation of utilities has been sent by the Indiana Public Utility Association to the 50,000 residents of Indiana who own securities of public utilities of the State. Charles L. Henry, president of the association, has issued a statement in the course of which he says in part:

> We are making this appeal for two reasons: We believe that future stability of the industry depends on continued regulation by the State, and we feel that the safety of investments made by Indiana people depends on regulation. Thousands of Indiana men and women have lent money to the utility industry because, under State regulation, they felt sure the industry would be permitted to earn a sufficient return to pay them reasonable interest for their money.

This action indicates that the association is now preparing to prevent radical changes in the utility laws of Indiana threatened to be made at the next session of the General Assembly. Those opposing the Public Service Commission, including Mayor Lew Shank of Indianapolis, and other city officials, are busy with their side of the campaign.

Mayor Lew Shank has already named a special committee which will recommend changes in the public utility law of Indiana. The Mayor never has wholly given up his idea of having the entire law repealed if it can be done, but the committee will meet early in September and will continue in session until some definite recommendations are ready to be submitted with reference to the present law. The state Legislature convenes in January.

New Incorporation in Prospect

After reaching a conclusion that there were too many disadvantages in an electric motor bus line, such as they had considered tentatively as a means of transportation between Fort Mitchell and Erlanger, Ky., citizens of the latter village recently decided to build a traction line instead. It is the intention of those behind the project to build tracks and erect the overhead wires from Mitchell to Erlanger and then lease the tracks to the South Covington & Cincinnati Street Railway, Cincinnati, Ohio, which will extend its Fort Mitchell line to Erlanger.

The 3¼ miles of traction line will be built by the Fort Mitchell, Erlanger & Elsmere Traction Company, which is to be incorporated for $75,000. Paul Hesser, Erlanger, has been elected president of the company. Other officers are: Judge H. F. Childress, vice-president, and Chester C. Davis, secretary and treasurer. These three men with George Rost and Attorney David C. Castleman, Covington, Ky., will constitute the board of directors.

Before selecting the traction line as the better means of transportation, those who are promoting the company said that they obtained assurance from the South Covington & Cincinnati Street Railway that the electric cars operating to Fort Mitchell would be extended to Erlanger, if the tracks were built and leased to the company at a reasonable figure. The proposition has not gone as far as a written agreement, but the citizens interested feel that they are justified in going ahead with the organization of the company.

As the Dixie Highway does not follow a straight line into Erlanger, the tracks will be laid on a private right-of-way. In some places it will be near the highway, but in others as far as a half mile or more away. It is estimated that about 3¼ miles of track will be needed to put in the extension.

Finishing Touches Being Put on New Orleans Ordinances

Paul Maloney, commissioner of the Department of Public Utilities, has introduced three ordinances in the Commission Council of New Orleans which, if adopted, will reduce fares in New Orleans to 7 cents and make the basic gas rate $1.30 per 1,000 cu.ft. from Sept. 10. The New Orleans Public Service Corporation, the successor under the reorganization to the New Orleans Railway & Light Company, will have three months to accept the conditions named in the new ordinances. These ordinances went over for adoption from Aug. 8 until Aug. 15 under the rules.

It is understood—and Commissioner Maloney has so expressed himself—that with the adoption of the ordinances on Aug. 15 the new corporation would go into court on Aug. 17 and take over the various subsidiary organizations controlled by the New Orleans Railway & Light Company. This action will now be delayed, however, on account of developments in connection with the foreclosure sale noted on page 275.

The first of the three ordinances provides that the city shall have a perpetual option on all property of the original company up to $11,048,000 plus or minus an amount equal to the additions to or deductions from the rate base made to the electrical system subsequent to Dec. 31, 1920.

The second ordinance covers the subsidiaries, and includes an option of $25,000,000 worth of property, under the same terms.

The third ordinance gives an indeterminate permit to the New Orleans Gas Company to operate in the city and gives the city an option over all the property.

Praises Advertising Delegation

Ad club members of Pine Bluff, Ark., met recently to show their appreciation of the advertising Pine Bluff received at the convention of the Associated Advertising Clubs at Milwaukee. In the absence of B. W. Benton, president, J. L. Longino, manager of The Pine Bluff Company, presided. He praised the endeavors of the Pine Bluff delegation and announced the purposes of the meeting. The speakers announced that Pine Bluff was ready to take care of any increased population or additional industries which might result from the advertising which the city received.

News Notes

Wages Cut.—A new wage scale affecting the employees of the Stark Electric Railway, Alliance, Ohio, was put into effect on May 1 and will terminate on May 1, 1923. The new schedule is a cut of 5 cents an hour, the maximum pay being 50 cents and the minimum 45 cents for the interurban men with 47 and 42 cents for city men.

No Change Contemplated.—No change in the superintendency of the Seattle Municipal Railway is contemplated by the present city administration, D. W. Henderson continuing as general superintendent of the railways. George F. Russell, new superintendent of public utilities, states that Mr. Henderson's powers are to be concentrated, not diminished.

Franchise Transfer Authorized.—Permission has been granted the Cincinnati, Newport & Covington Railway to assign its franchise to operate within the city of Cincinnati, Ohio, to the South Covington & Cincinnati Street Railway. The ordinance granting the transfer was favorably recommended by the committee on street railroads. The transfer will be made as a refinancing measure.

Service Temporarily Suspended.—As a result of a strike by the power plant employees of the Boston & Maine Railroad at Franklin the Concord (N. H.) Street Railway had to suspend service for a day or two. The railway is dependent on the plant for power. Service was resumed, however, power being supplied from plants at Newport, in Concord and on the Merrimack River at Gavin's Falls.

Agreement Renewed on Engineers' Wages.—The Cincinnati Traction Company and the Stationary Engineers' Union have reached an agreement, whereby the scale now in effect will be continued another year. The engineers took a considerable reduction a year ago following a strike. The stationary firemen and oilers, who had an arbitration award a year ago, are awaiting another decision to be rendered as soon as the State Industrial Commission appoints a neutral chairman.

Paving Ruling Stirs Kokomo.—The case of the petition of the Indianapolis (Ind.) Street Railway before the Public Service Commission which provided that the company should not be made to pave between its tracks in Indianapolis and which was decided in favor of the company may be made a precedent for the entire state of Indiana. Steps now are being taken in Kokomo to get through an ordinance which will specifically specify that the Indiana Railways & Light Company there be compelled to pave between its tracks and that the case be carried to the Supreme Court of the State.

Reports Against Trial Bill.—The Senate committee on corporations of the General Assembly of Louisiana, now in session at Baton Rouge, has unanimously reported adversely the bill recently introduced, at the request of the street car men of New Orleans, to provide trial of all employees of public service corporations before dismissal on charges. The Car Men's Union was represented by James Keenan, its president, and Gus Heintz, member of the executive committee; Receiver J. D. O'Keefe of the New Orleans Railway & Light Company and Abe Goldberg, attorney, appeared for the railways.

New City Plan for Worcester.—Publication in full has been made of the text of the city plan for Worcester, Mass., which has been in preparation since 1915 under the direction of the City Planning Board and a group of New York experts. It is said that through the report the city has discovered that it can save the equivalent of $6,500 a day every day in the year by improving street facilities and traffic methods in a way to make them adequate to the amount of traffic carried. All the usual provisions of city plans are included, such as coordination of street cars, trackless trolleys, motor buses and steam roads; relocation of freight yards and tracks so as not to impede the proper expansion of business or residential districts; amplification of sewage and water supply systems.

Financial and Corporate

Car Trusts Sold

$4,864,359 Represents Amount of Depreciated Value of Equipment Secured by P. R. T.

Dillon, Read & Company, New York, N. Y., offered for subscription an issue of $2,150,000 Philadelphia (Pa.) Rapid Transit Company's 6 per cent equipment trust certificates. They were offered at prices to yield from 5 to 6 per cent, according to maturity, and are due in equal semi-annual instalments from Feb. 15, 1923, to Aug. 15, 1932. The certificates are issued by the trustee against standard street railway equipment, comprising 600 cars, with a present depreciated value appraised by the builders at $4,864,359. The issue was oversubscribed by a large amount.

The offering was significant for several reasons. First, the amount involved was large for an issue of this kind. Second, the interest rates were well within the limits which money loaned for similar purposes has commanded recently, thus reflecting the good credit standing of the company. Third, it is said that this was the first instance in recent years if not in the history of the company that financing has been done by the company through other than the Drexel or allied interests in Philadelphia.

The floating of the certificates is said to have followed directly a conference between members of the United States Shipping Board and Thomas E. Mitten, president of the company, in Washington. The greater part of the funds from the trust certificates will be used to purchase 100 large yellow Hog Island cars (out of a total of 210), power equipment, track and other facilities, from the Government. The Philadelphia Rapid Transit Company has had the cars and equipment under lease from the Government since their construction in 1918.

According to the company statement, "Series F" will cover 500 near-side or center-exit cars and all or part of the 210 Government cars furnished during the war. All of the 710 cars are now in operation on the lines of the P. R. T.

Five hundred thousand dollars will be spent to retire equipment trust certificates now outstanding against the 500 near-side or center-exit cars; $1,200,000 will be used for the purchase of the Government cars and equipment, and $450,000 will be held available for further improvements and additions to property.

Six hundred standard steel cars, part of which were constructed in 1913 and part in 1918, constitute the equipment which was pledged for the issue. As stated previously, it is estimated that the depreciated value of the cars is $4,684,359, or more than double the amount of the certificates.

To what extent the additional $450,000 from the series "F" fund will be used "for further improvements and additions to property" was not made known. At present it will be held in reserve pending the development of future plans, it was declared.

Power Project Taken Over by Graham Interests

The property and franchise of the Washington County Light & Power Company were sold at Machias, Me., on Aug. 7 by Receiver Irving E. Vernon, Portland. They were purchased by Edward M. Graham, president of the Bangor Railway & Electric Company.

The Washington County Light & Power Company was chartered by the Legislature about four years ago. The company purchased the lighting company doing business at Machias. It began its development at Columbia and had a dam at the place about 75 per cent completed when financial difficulties were encountered and early in the present year a receiver was appointed.

With the Bangor Railway & Electric Company, the Union River Light & Power Company at Ellsworth and the Washington County Light & Power Company practically under one management, President Graham by his purchase became identified with a lighting and power system which will eventually extend from Lincoln to Eastport, a distance of practically 200 miles.

Bondholders Buy Ohio Electric for $2,000,000

Bondholders of the Ohio Electric Railway, Springfield, Ohio, represented by Thomas Newhall, Philadelphia, bid in at the upset price of $2,000,000 the property of the company, consisting of the interurban line between Lima and Toledo, power and heating plants at Lima and the city street railway system there, at the special masters' sale at Toledo, on Aug. 15. Mortgages totaling $4,200,000 were foreclosed recently and the property ordered sold by the Federal court.

B. J. Jones, receiver, who was made special master to conduct the sale, said that operation of the line would not be interfered with by the sale. City commissioners of Lima and representatives of the street railway and power interests have agreed upon new franchises there. It is expected that those local properties will be grouped under separate management.

It was agreed to put $200,000 of new capital into improvements on the Lima properties.

Reorganization of the Ohio Electric interurban property will probably follow the confirmation of the sale by Judge John M. Killits at Toledo.

Sale of Property Delayed

City Attorney Charges Sale of New Orleans Road Should Have Been Advertised Fifteen Days

City Attorney Ivy Kittredge has called a halt in the proposed public sale of the New Orleans Railway & Light Company, New Orleans, La., which was advertised to come off Aug. 17. In an opinion to the members of the Commission Council, made public on Aug. 13, the city attorney holds that, under Section 28 of the city charter, which has not been repealed and which is not affected by the indeterminate act of the Constitution of 1921, it is specially provided that every ordinance mentioned in the charter granting use of a public street, whether for pay or not, must be advertised fifteen days before the City Council can adopt it.

When the question was raised regarding the legal features of the proposed sale under authority of the indeterminate permit accorded the City Council, without having previously advertised the permit to do so, for fifteen days, as required by the city charter, counsel for the company, H. Generes Dufour, held that the matter came under Act 94 of the Constitution of 1921 and could not affect the legality of the proceedings or sale.

The city attorney to whom the matter was referred by the Commission Council now declares that the indeterminate act, alluded to, specifies no details or forms, delays or advertisements that the Council must pursue and hence to conduct the sale, in strict accordance with law, the permit must be advertised for fifteen days.

C. C. Chappelle, representing the eastern stockholders, who attended the conference held between the members of the Commission Council and the representatives of the railway company, was for proceeding with the consummation of the sale, in strict accordance with law, although he was anxious to hasten matters. If the city attorney was of opinion that the permit should be advertised, he (Chappelle) would offer no objection, although the conference was undecided whether such further advertising was necessary.

Commissioner of Finance Murphy in expressing his pleasure over the result of City Attorney Kittredge's counsel, said he was just as anxious to have the matter cleared up legally as he was to have it disposed of quickly, and did not apprehend that more delay would affect the reorganization of the company.

Commissioner Maloney of the Department of Public Utilities, while declaring that he did not agree with the legality of the opinion of the City Attorney, thought the city attorney was acting for the best interests of the city and that he therefore would vote to advertise the permit.

The ordinance was to have come up for adoption on Aug. 15. This hiatus will of course not only delay the sale of the property but will postpone the contemplated reductions of both street car fares and the gas rate.

Receiver Appointed for Ogdensburg Street Railway

The Ogdensburg (N. Y.) Street Railway was placed in the hands of a receiver on Aug. 12 following an action commenced before Justice John C. Cropsey in Supreme Court by trustees named in the mortgage given by the railway to secure the payment of $150,000, together with interest amounting to $125,000. James E. Kelly, president of the St. Lawrence County Savings Bank, Ogdensburg, was named receiver. A large amount of the company's indebtedness is to the city of Ogdensburg, statements indicated.

Another Dividend Re-established

The United Railways & Electric Company, Baltimore, Md., has declared a quarterly dividend of 50 cents a share on the common stock payable on Aug. 15 to stock of record Aug. 3. This is the first dividend on the issue since January, 1919, when a quarterly distribution of the same amount was made.

Will Petition for Removal

The Northern Ohio Traction & Light Company, Akron, Ohio, will seek permission of the State Public Utilities Commission for authority to remove its railway system in Massillon. An announcement to this effect was recently made by General Manager A. C. Blinn to the Massillon City Council. City officials have been told by General Manager Blinn that the company is losing $25,000 a year on this city line. The company also objects to an estimated assessment, said to be large, as its share of the paving of two streets in Massillon. The company plans to build an interurban line to connect with the Massillon-Dover line. This interurban, the company claims, can be built for less than it will have to pay for the street improvements.

Subsidiaries Make Claims of $749,274

An order issued in United States District Court directs the receivers of the Pittsburgh (Pa.) Railways to show cause why they should not pay claims amounting to $749,274 made in behalf of two subsidiary companies. Six petitions were filed separately on behalf of each company but all concern rentals of leased property which the Pittsburgh Railways had contracted to pay.

The rentals were paid by the Philadelphia Company, which had guaranteed to pay all such claims in case the Pittsburgh Railways was unable to meet the payments. The petitions assert that the subsidiary companies must receive the money from the Pittsburgh Railways to discharge the indebtedness to the Philadelphia Company that they have thus incurred.

The petitions are: The Consolidated Traction Company for $473,100, $24,100 and $84,600 and the United Traction Company for $15,200, $1,974 and $150,300. The obligations were incurred by the Pittsburgh Railways Company by agreements made when mergers were effected with the subsidiary lines.

Reorganization Being Arranged

Final arrangements are rapidly being made for completing the reorganization of the South Carolina Light, Power & Railways Company, Spartanburg, S. C. As noted in the *Electric Railway Journal* for Aug. 5, page 211, the entire property of the company was purchased at receiver's sale on July 31 for $1,000,000 by the representatives of the bondholders.

It is proposed to transfer the property as a going concern to the South Carolina Gas & Electric Company. The new company will be capitalized as follows: $1,000,000 of 6 per cent preferred stock is to be issued, $2,000,000 of authorized 7 per cent prior preferred, 12,500 shares of no par common, $3,497,000 of first mortgage 6 per cent bonds and $650,000 of 6 per cent general mortgage bonds. The former outstanding issue of $3,497,000 of first mortgage 5s and the $176,000 of secured bank loans will be paid or refunded by new first mortgage 6s to a similar amount, and the $650,000 of 7 per cent 5-year notes will be paid or refunded with the 6 per cent bonds.

The unpaid interest and the unsecured claims will be paid or refunded by scrip. Holders of preferred stock in the old company will receive share for share preferred stock as the new company and present holders of common will receive one-half share of new no par value common for each share of old. The new prior preferred stock will be held in the treasury subject to conversion therein of the 6 per cent general mortgage bonds at 90 per cent.

For more than a year now the company has been operating under conditions which have constantly been growing better. Rates have been advanced and as no interest has been paid for some time now on the funded obligations, a cash balance has accumulated which will be used for improvements.

Earnings of the company under the new rates are said to show a very satisfactory ratio above fixed charges imposed by the new capitalization.

Redemption and Conversion Notice Announced

The Toledo Traction, Light & Power Company, Toledo, Ohio, has announced that on Sept. 1 it will make payment on its first lien 7 per cent gold bonds dated Sept. 1, 1921. The holders of these bonds will be paid the principal together with a premium of ½ per cent of such principal and interest accruing to Sept. 1, 1922.

It was also announced that the privilege of converting and exchanging these first lien 7 per cent gold bonds into Cities Service Company Series D 7 per cent convertible gold debentures will expire on Sept. 1, 1922.

Financial News Notes

Land Sold.—The Detroit (Mich.) United Railway has sold a 12-acre piece in the Grand River section of the city. The sale price is said to have been $350,000.

Net Income of $602,272.—The Market Street Railway, San Francisco, Cal., for the six months ended June 30, 1922, reports a railway operating revenue of $4,675,810 and expenses totaling $3,421,877. The net income is $602,272, which includes no provision for Federal income tax sinking fund or betterments.

Railway Included in Merger. — The property of the Water, Light & Transit Company, Carrollton, Mo., was included in the deal under which the properties of the Kansas City Light & Power Company and the Carrollton County Power & Light Company were brought together in consolidation. Only 2 miles of electric railway are included.

Buys Railway Property.—B. F. Loos of Minneapolis has bought the property owned and controlled by the Iron River, Strambaugh & Crystal Falls Street Railway, Iron River, Mich., for $109,797 based on appraisal by the Rau Appraisal Company of Milwaukee. The property includes ten street cars, repair houses, station houses, equipment and trackage.

Net Income of $3,000,000.—Total operating revenue of the Brooklyn (N. Y.) Rapid Transit Company for the year ended June 30, 1922, was $34,544,093 against $30,972,085 for the previous year. Operating expenses decreased from $26,425,704 to $22,040,554 for the period ending June 30 of this year. The net income for this year's period was $3,087,419 against a deficit a year ago of $4,880,934.

Stock Issue Approved.—The Board of Public Utility Commissioners of New Jersey has granted approval to the application of the Morris County Traction Company operating in Morris County, to issue $1,600,000 mortgage bonds; $1,500,000 par value of its preferred stock and $1,179,000 common stock. The issuance of the additional capital stock is to make extension to the company's property.

Gold Certificates Sold.—The Cincinnati (Ohio) Traction Company has sold an issue of $725,000 of 6 per cent equipment trust gold certificates to Halsey, Stuart & Company, Chicago, Ill. The proceeds of the sale are to finance the purchase of seventy-five new double-truck cars, which have been ordered by the company and which will be built at the plant of the Cincinnati Car Company. These cars will be ready for operation late in the fall and will supplant the present single-truck cars.

Traffic and Transportation

Safety Responsibility Partly in Hands of Public

An important decision has been handed down by the Massachusetts Department of Public Utilities relative to the warnings that the Boston & Worcester Street Railway shall be required to give the public in the town of Shrewsbury. The selectmen of Shrewsbury sought to enforce certain old franchise requirements regarding signals, and in addition to this they wanted automatic swinging arm or flashlight signals, similar to those recently installed on some of the railroad crossings in Massachusetts. In its decision the Department of Public Utilities lays down the principle that the travelling public must assume some of the responsibility for safety at crossings. It declares bell signals that were practical before the days of the automobile horns to be less useful at the present time. The commission says:

> The commission has given much consideration to requiring the company to make a full stop before proceeding over the crossing. The grade on the railway at some of these crossings is so steep that it would seriously interfere with the operation of freight cars, as well as slow up the schedule of passenger cars, to make a full stop at all of the crossings. Furthermore, if cars stop at some crossings in one direction and not in the other, it is apt to mislead travelers on the highways.
>
> After consideration of all the facts and circumstances in the case, including the duty of travelers upon the highway to exercise due care and not throw the whole burden upon the street railway, we are of the opinion that reasonably adequate protection would be afforded the traveling public on these highways if, in addition to the maintenance of the signs now installed, all cars sounded their whistles 500 feet from the crossing and again at 250 feet and reduced their speed over the same to 5 miles per hour.
>
> It is therefore
>
> Ordered. That the Boston & Worcester Street Railway Company in the operation of its cars over the crossings known as Fruit Street, South Street, Grafton Street, Lake Street and Turnpike, in the town of Shrewsbury, in addition to the maintenance of signs as now installed, sound a whistle five hundred (500) feet and again at two hundred fifty (250) feet from each crossing and reduce the speed of its cars to five (5) miles an hour over the same.

Bus Lines Purchased to Improve Service

The Puget Sound Electric Railway, Tacoma, Wash., in an effort to improve its service to the travelling public, has purchased the auto bus lines between Tacoma and Olympia, 32 miles, from Thompson-Smith interests. The deal approximates a consideration of $150,000. According to A. W. Leonard, president of the company, the bus lines were purchased to provide better connections for the travelers from Seattle to Olympia, and better service from Tacoma to Olympia. The company will not extend its transportation beyond Olympia, Mr. Leonard states, and the report that the bus lines from Olympia to Aberdeen have been purchased is untrue, he further advises. "We are in the transportation business, and this extension is not an effort on our part to effect a monopoly, but solely in the interest of better transportation," said Mr. Leonard.

Railway and Stage Lines Join in Protest

Protests against the new time schedule filed recently by H. E. Knowles, operating jitney buses between Seattle and Bryn Mawr and Seattle and Rose Street, under his Seattle-Renton certificate, have been filed with the street department of public utilities at Olympia by the Seattle & Rainier Valley Railway and the Seattle-Renton stage lines. The railway protests that the time schedule shows an operation entirely within the city limits, between Seattle and Graham Street; that the railway service is adequate, that Knowles is operating without proper authority from the state, and that the department has no authority to permit the filing of a time schedule for strictly city operation. The stage lines' protest is based on the claim that Knowles is not a good faith operator, and has no right on the run. Knowles in his time schedule proposes one round trip per day between Seattle and Renton, forty-three extra trips between Seattle and Bryn Mawr, and fifty extra trips between Seattle and Rose Street. Hearing will be held in Olympia.

Wants Motorists' Help for Safety Campaign

The United Traction Company, Albany, N. Y., recently started a campaign for the prevention of accidents. H. B. Weatherwax, vice-president of the company, has sought the aid of owners of pleasure cars and commercial vehicles in the territory covered by the traction company in a letter requesting co-operation and offering ten suggestions for safe operation on routes traversed by the electric railway cars. The letter says in conclusion:

> You will be safeguarding your own interests and be of material assistance to us by observing the following precautions:
>
> 1. Make sure trolley car is not coming when starting out from curb, and give proper warning before starting if car should be near.
> 2. Do not trail the trolley car too closely.
> 3. Cross crossings cautiously.
> 4. Be watchful of trolley car making curve so as not to be hit by swing of rear end.
> 5. Avoid parking cars near trolley curves in narrow streets so as not to be caught "in the pinch."
> 6. Avoid speeding to get ahead of trolley when other cars are parked at the curb.
> 7. Avoid crossing in rear of trolley car, other cars, unseen, may be coming in the opposite direction.
> 8. To get ahead of trolley car, make sure it is well to the rear before cutting in front.
> 9. Observe law and do not pass trolley while taking on or discharging passengers.
> 10. When parking at curb in narrow streets, be sure there is plenty of room for trolley to pass.
>
> Safety First.

Case Before Special Master Being Concluded

Taking of testimony in behalf of the State in the 10-cent fare hearing before Special Master Haight was concluded on July 25 and the presentation of rebuttal evidence for the Public Service Railway was begun on Aug. 7. Summing up of the opposing attorneys and the submission of briefs will complete the case.

By consent of counsel, the special master agreed to have introduced as evidence, without reading, copies of municipal ordinances bearing on the operation of street railways. The special master also agreed that Mr. Petty and General Auditor M. R. Boylan of the Public Service join in correcting some minor errors in figures in the various tables submitted.

Tabulations made by the commission pointed to a heavy loss in revenue-producing passengers alleged to be due to the 8-cent fare. Figures submitted gave the number of passengers carried under the 8-cent fare as 394,858,000, while estimates of the number which would have likely been carried under the 8-cent fare fixed by the commission and suspended by the court increased this number to 416,605,000, a loss under the present fare of 21,747,000. Figures were introduced purporting to indicate that the increase in jitney passengers showed that a majority of this loss had gone to the jitneys.

While there was a loss in the number of passengers carried under the increased fare, the total operating income was slightly higher than it would have been under the 7-cent fare. The additional sum, however, was held by the commission to be insufficient to warrant the efforts made to secure the higher fare. The income under the 8-cent fare was given at $6,321,691, while the estimated revenue under the 7-cent fare was given at $6,018,778.

Figures submitted showed that the actual net income of the company was $269,000 in excess of the estimate, or approximately $6,740,000 on something over a 7 per cent return on the valuation fixed by the commission on the company's property.

An attack was made on the amount set aside by the Public Service for claims, it being asserted that the sum was in excess of that necessary.

Second One-Man Car in Operation

The Olean, Bradford & Salamanca Railroad recently put its second one-man car in operation in Bradford, Pa. Several months ago the first one-man car was put into service and proved a success. General Manager Wheeler announces that this service will be extended to the cities of Olean and Salamanca. The company has presented a new fare schedule to the Public Service Commission, which will cut fares between inter-stop points in Bradford about 10 per cent, while terminal tickets will be reduced to the level of steam railroad prices.

Interchangeable Transfer System Recommended

In December, 1921, the California State Railroad Commission recommended an increase in the fare on the Pacific Electric Railway lines, effective on Jan. 1, 1922, and urged that each individual city served by the company should confer with the commission's engineers and representatives of the railway to adjust the matter of local fares, service and jitney bus competition. These conferences as regards the city of Pasadena have been concluded and on July 26 a report was presented by the two consulting engineers representing the city, Franklin D. Howell and T. D. Allin, who had studied the subject with F. E. Geibel, special engineer of the Pacific Electric Lines. The report recommended that the local car service should be retained. Pasadena has a population of over 40,000 and a local street car mileage of 40.9 equivalent single track. For several years there has been considerable jitney bus competition.

On this point, after recommending certain changes in railway trackage and bus routes so as to reduce this competition, the engineers declare definitely that all bus and rail lines should issue transfers, one to the other, whether operated by the same or different companies and that a responsible company only should operate city buses. In general the buses should give the crosstown traffic.

Considerable space is given in the report to the paving charge and to the expense to the railway company of abandoning first class track on account of city requirements before the life of the track had run. On this point the report says:

> The track once laid should be allowed to be maintained until at least 80 per cent of its usefulness has been realized; girder rail construction should not be required except on such streets as are through, main arteries of general travel; paving should be eliminated from railway investments or expense, except so far as the railway company cuts paving for purposes of construction or repair, in which cases it should replace the cut portions only.

In short, the engineers recommend that all possible expense not directly contributing to railway operation be eliminated as a means of reducing the excessive costs mentioned.

Opposes Fare Reduction in Kansas City

Francis M. Wilson, receiver of the Kansas City (Mo.) Railways, recently commented on the agitation for fare reductions and the talk about new wage schedules. In answer to the demands contained in the 5-cent fare resolution proposed by the Central Labor union of Kansas City, he said that a return to a 5-cent fare would bring about a reduction in trainmen's wages from 53 cents an hour to 33 cents. Further that the receipts of the company would decrease $3,300,000 a year, which would destroy the receivership and defeat the end for which it was established. Besides this, service would have to be curtailed and the abandonment of several lines would follow.

He said that he would indorse any movement having for its end a reduction in fare provided this could be done without serious consequences to the riding public. In his opinion no fare reduction could be effected until wages were reduced and he said that he would never agree to a reduction in wages "of efficient and courteous employees until economic conditions justify the decrease."

Transportation News Notes

Consideration for Summer Passengers.—According to a recent order of the South Carolina Railroad Commission the Augusta-Aiken Railway & Electric Corporation must provide ice water on its cars from March 1 to Oct. 1.

Pass Meeting With Success.—Officials of the Tacoma Railway & Power Company, Tacoma, Wash., report that the success of the weekly pass system has been beyond expectations. The second week of the pass considerably exceeded the first week, when 7,004 passes were sold.

Increase Fares.—Increase in fares to a flat 6 cents from a rate of 5 cents for adults and 3 cents for children has been granted the Dayton & Troy Electric Railway by the Piqua City Council. As a result the railway has promised to install several additional cars, probably of the one-man type.

Will Seek Franchise Amendment.—It has been announced by C. G. Holland, president of the Danville Traction & Power Company, Danville, Va., that the company will ask the City Council for an amendment to the railway franchise which will permit the use of one-man cars on the system. The present franchise specifies that all cars shall be operated by two men.

Cars Marked to Assist Patrons.—In line with its consistent policy of bettering the service the Des Moines (Ia.) City Railway recently announced that all cars would be marked with a large number to assist the public in locating cars. Each line in the city has been assigned a number running from one to twenty-six and a sign bearing the number of the line will be displayed conspicuously on the front of the cars.

Jitneys Barred—By an order of Brigadier-General Moseley jitneys have been barred between Battle Creek and Camp Custer, as a result of the Michigan Railway having agreed to increase its car service between the city and the camp. All jitneys have been eliminated from the reservation with the exception of the jitney under control of the post exchange which will meet all cars at Twenty-first Street, Camp Custer.

Trackless Trolleys in Prospect. — Charles R. Barnes Railway Commissioner of Rochester, N. Y., with James F. Hamilton, president of the New York State Railways, has under consideration the establishment of three trackless trolley lines in Rochester. Definite announcement of the details of the plan together with the approximate date of starting the service will be given out shortly.

Service Suggestion Wins Prize.—The transportation department of the Los Angeles (Cal.) Railway each month is offering cash prizes for valuable service suggestions by employees. Seventy-eight suggestions were submitted during the month of May for the first awards. The first prize of $50 goes to Motorman Estes, who suggested that efforts be made to broadcast some ideas on street car service and safety by the radiophone.

Free Rides for Veterans.—From June 17 to June 25 confederate veterans and boy scouts in uniform were presented with special free tickets for transportation on cars of the Virginia Railway & Power Company, Richmond, Va. Granting this privilege for re-union week was the result of a letter to General Manager Harvell from W. M. Myers, director of public safety, who said that this plan would work to the satisfaction of the veterans.

Confer on Relieving San Antonio Railway.—The San Antonio (Tex.) Public Service Company is losing more than $25,000 a month from the competition of the jitneys. W. B. Tuttle, vice-president and general manager, has informed Mayor Black that the company cannot continue the present service in face of this loss; that some lines must be discontinued, and that service on others will have to be curtailed. It is estimated that more than 30 per cent of the city's transportation is now done by jitneys.

Will Indorse Certain Bus Projects.—John S. Bleecker, general manager of the Indiana, Columbus & Eastern Traction Company, Cincinnati, Ohio, recently assured representatives of the Springfield-Mechanicsburg Motor Bus Company that he was ready to do all in his power to encourage bus lines to towns not reached by the traction line. Facing the prospect of being forced out of business by the terms of the licensing and regulatory ordinance recently adopted by the Springfield City Commission the bus men called on Mr. Bleecker to enlist his co-operation.

Railroad Victor in Jitney Issue.—The Board of Public Utility Commissioners of New Jersey announced recently the dismissal of the application of the Weehawken township committee and a number of jitney bus owners for an order restraining the West Shore Railroad from excluding jitney buses from space heretofore occupied by them at the Weehawken ferry terminal. The board said it was without jurisdiction to decide the title and easement of the space occupied by the buses, and held that under a former court decision the railroad has the right to regulate the movement of buses on its property.

Legal Notes

CALIFORNIA—*Duties of Cars, Other Vehicles and Pedestrians on Street.*

In an action by a pedestrian for injuries received in a collision between a motor truck and a street car, instructions that a street car has the right of way on that portion of the street on which it can travel, and that if the driver of the motor truck was using due care, no negligence should be imputed to its owner, and that in operating its cars along its tracks the street car company was obliged to use ordinary care to avoid coming into contact with vehicles driven across the tracks, considered as a whole, were not erroneous as being misleading. [Armock et al. vs. United Railroads of San Francisco et al., 204 Pacific Rep. 856.]

FEDERAL COURTS—*Public Service Commissions—Action Reviewable by Federal Court Only on Constitutional Grounds—Valuations.*

The action of a public service commission in prescribing rates to be charged by a public utility corporation is reviewable by a federal court only on the question whether it is an invasion of constitutional rights and such collateral questions as are incidental thereto, and the presumption is in favor of its validity.

A franchise for a public utility is granted on the implied condition that it shall be used for the public benefit and at reasonable rates of charge to the public, and in the computation of the value of the property used in the service by a public service commission for the purpose of establishing reasonable rates, the value of the franchise should not be taken into consideration. In ascertaining the present value of physical property in a period of changing values, a decided tendency to higher or lower may be recognized and considered; failure to earn a fair return in past years is not a factor to be considered nor is the federal income tax allowable as an expense of the business. [Georgia Ry. & Power Co. vs. Railroad Commission, 278 Federal Rep. 242.]

FEDERAL COURTS—*A Court in Enjoining Statutory Rate, May Fix Conditional Rate.*

While a court of equity has no power to fix rates of fare to be charged by a street railway company, it may, when granting a preliminary injunction restraining as confiscatory a rate established by a state board, name a rate as a condition of the injunction, beyond which the company may not go pending final adjudication and the determination of a just rate by a proper body, with provision for refunding of any excess above the bond rate in case that rate is finally sustained. [Public Service Ry. Co. vs. Board of Public Utility Commissioners, 276 Federal Rep. 979.]

GEORGIA—*State Commission Orders Are Superior to City Ordinances.*

A city ordinance requiring street railway companies to divide cars into separate divisions for white and colored passengers and to designate the divisions by a sign or placard conflicts to some extent with a rule of the Railroad Commission requiring white passengers to be seated from the front of the car towards the rear, and colored passengers from the rear of the car towards the front, and requiring each seat to be filled to capacity before taking the next seat. Hence, the commission's order had superior and binding force and effect as a civil rule to the exclusion of the municipal ordinance. [Savannah Electric Co. vs. Lowe, 108 Southeastern Rep. 313.]

MASSACHUSETTS—*A Street Railway Company Is Not Required to Protect an Intending Passenger Against Pushing by Crowd While on the Public Highway.*

A street railway company was not negligent in failing to restrain a crowd waiting for a car, at a stopping place where there was no station or platform, and passengers boarded the car from a public street, and it was not liable for the injury to a child pushed under the side of car by the crowd, assuming that she was a passenger. [Savickas vs. Boston Elevated Railway, 132 Northeast. Rep. 29.]

NEW JERSEY—*The Order of a Public Service Commission Requiring a Public Utility to Set Apart a Depreciation Fund Held Not the Fixing of a Just and Reasonable Rate. Where an Order on Rates is Not Supported by Evidence, the Court May Set It Aside and Remand the Proceedings.*

An order made by the Board of Public Utility Commissioners requiring a public utility to set apart yearly a depreciation fund of a fixed amount, and its refusal of a sufficient rate for services rendered to produce the necessary income for that purpose, is not the fixing of a just and reasonable rate. The court has no power to fix the rate, but where a commission's order on rates is not supported by the evidence, the court has the power to set aside the order and remand the proceeding to the commissioners to fix a just and reasonable rate, based on the evidence. [Public Service Ry. Co. vs. Board of Public Utility Commissioners, 114 Atlantic Rep. 323.]

PENNSYLVANIA—*Public Service Commissions Have no Jurisdiction Over Lessor Companies Which Have Ceased to Function*

The Public Service Commission has no jurisdiction over a public service company which under legislative authority has leased its franchise and property to another corporation and has ceased to function, since it has no rates to make or collect, no service to render the public, and no facilities to furnish or extend. The commission is concerned only with the rendition of service by the operating company at reasonable rates, and it is immaterial if the operating company under its lease must pay an unreasonable rental to the lessor and is thereby prevented from earning a reasonable return. [Philadelphia City Passenger Ry. vs. Public Service Commission of Pennsylvania et al., Appeal of City of Philadelphia, 114 Atlantic Rep., 642.]

PENNSYLVANIA—*Financial Condition Held Not to Excuse Failure to Improve Streets. Commission's Consent Unnecessary to Minor Changes of Street Grade.*
